Mr. March: And also it might have a very definite bearing, if the Examiner wants to know what I am driving at, upon this competition with coal. If they reduce the gas rates right here in Denver now and coal is their principal competitor, there will be some question there as to how serious coal will compete then. If they compete seriously now and if these rates are reduced and brought down to what they ought to be, why then there might not be any competition there at all. The gas might have all the business. I want to follow through this competitive proposition. I didn't mean to get to my point that quick.

The Trial Examiner: Mr. March, the witness is testifying to the present situation as I understand it.

Mr. March: This exhibit covers from 1923 through to 1938 and none of it pertains as I understand it to 1940. I haven't seen a schedule in here yet dated 1940.

The Trial Examiner: That's what I mean. His testimony is dealing with the existing competitive situation.

Mr. March: That's what I'm dealing with.

The Trial Examiner: Well, I don't understand your questioning.

Mr. March: I'd like to be permitted to continue.

The Trial Examiner: Go ahead.

Mr. Lange: There is just this point, Mr. Examiner, probably that you may have in mind. We want to pursue this questioning in this respect also: There are a great many assumptions in this exhibit that aren't reflected in actualities. The witness himself stated that they are assumptions and haven't been reduced, or that aren't reflected into actualities existing on this system, particularly not in Denver, and we want to follow through on that and let this record reflect what is actually existing.

Mr. Dougherty: May I just say I don't agree with that so that no one will say I sat quiet when I should have spoken.

Mr. Lange: Well, just say with reference to kerosene. The witness definitely said that that is purely an assumption that the amount used is negligible. Still he sets it up as one of the basic uses or competitive fuels that would probably get into the picture and now I emphasize "probable" because he himself said that it would be within 98 per cent of probability.

The Trial Examiner: I think that it is entirely proper for the Commission's counsel to cross examine with respect to those matters. I am not endeavoring to shut off cross examination. However, it occurred to me that the Commission's counsel was spending some time on a matter that isn't particularly important.

You may proceed, Mr. March.

Mr. March: All right.

Q. You say that if the rates in Denver were reduced, the gas rates for water heating—

A. Water heating.

Q. —there would be an increase in the use of gas for wafer heating.

A. That's my opinion.

Q. Of course there would be a corresponding increase in the sale of gas here in Denver.

A. That's correct.

Q. All right now, let's go to the next type of domestic service.

A. House heating?

Q. House heating.

A. That is, a volume of natural gas sold for house heating—

Q. Yes.

A. —depends entirely upon the ratio between the cost of gas and the cost of the next competitive fuel.

Q. Coal.

A. Yes.

Q. So if the rates were reduced for house heating purposes, gas rates, there would be an increased use of gas for house heating purposes?

A. Yes.

Q. Let's go to the next type of service?

A. Refrigeration.

Q. Yes.

A. I think that comes in the same category as cooking for domestic purposes.

Q. Why?

A. Because the use is so small and the cost of refrigeration, such a large part of the cost of refrigeration, lies in the carrying charges on the equipment. The amount of gas used isn't great. I don't think that a user of refrigeration for domestic purposes will be swayed toward or away from the purchase of an electric refrigerator by change in the price of gas for refrigeration.

Q. You don't know though?

A. That's my experience as a natural gas engineer, experienced in those matters.

Q. How much gas—do you know approximately the ratio between the use of gas and electricity for refrigeration purposes in Denver?

A. The number of gas refrigerators as against electric refrigerators, no I don't.

Q. You do know that electricity is the only competitor there, of course?

A. Except natural ice.

Q. Yes. You don't know what the situation is here in Denver. How can you testify what will be the reaction.

A. I know what the situation is generally in the industry.

Q. The people use gas because they like gas for refrigeration and people use electricity because they like electricity for refrigeration.

A. Yes, and the price doesn't make much difference. It is more a question of salesmanship.

Q. It makes some difference, doesn't it?

A. I don't think it does, frankly. I am trying to answer frankly and that is the best answer I know.

Q. What percentage of the gas sold by—sold in Denver is used for refrigeration purposes?

A. I don't know.

Q. Probably very negligible compared to the whole load, wouldn't you say?

A. Very negligible.

Q. What would you say in regard to cooking?

A. I'd say it was a minor part of the whole load, not a negligible part of it, however.

Q. All right, let's go to the next type of service.

A. Such as?

Q. Domestic service. Is there any more?

A. I don't know of any more.

Q. All right, we'll go to commercial service, then.

A. Generally speaking, a reduction in the price of gas will have a stimulating effect on commercial sales unless they are already saturated.

Q. And they aren't already saturated here in Denver?

A. I don't know.

Q. You don't know anything about the commercial situation?

A. I know the domestic situation only.

Q. There would be an increase there?

A. There should be.

Q. What about small industrial consumers?

A. The small industrial—well, I'd say that if he isn't now using gas and the rates were reduced to a point where they would be competitive with coal, assuming they weren't now competitive, the use of industrial gas by small users should increase.

Q. How about large industrial consumers?

A. The same holds true as to large industrial consumers.

Q. Do you know about what percentage of the load in Denver is commercial, small industrial and large industrial?

A. No, I do not.

Q. You know it is very large, though, don't you?

A. I know the amount of industrial gas sold in Denver is considerable.

Q. And you wouldn't want to make a statement here in the record that in your opinion that if rates were reduced for all types of service here in Denver there wouldn't be more gas used than there is now?

A. In the aggregate?

Q. Yes.

A. I would say that if the rates were reduced there should be more gas sold in the aggregate.

Q. It would be tremendous?

A. I couldn't say there will. It all depends on the extent of reduction and the present competitive situation.

Q. Yes. Do you know anything about what capacity the Colorado Interstate system is operating now?

A. Yes, sir—this day?

Q. This day.

A. How much gas is going through?

Q. What percent of the capacity is being utilized?

A. This day I couldn't say.

Q. Could you take care of this increase here in Denver?

A. At present?

Q. Yes.

A. I am not operating the Colorado Interstate Gas Company. I would say that any substantial increase in the load in Denver would have to be taken care of either by shutting off industrial consumers or by adding facilities to the system.

Q. In other words, this market has reached—is all that you can handle as it stands now?

A. The total volume on peak days is approaching that point and may well exceed it this winter. They exceeded it last winter for one day as I understood from Mr. Hendee's testimony.

Q. You heard Mr. Hendee's testimony?

A. Yes.

Q. Do you agree with his testimony on that point?

A. I think his testimony in that regard wasn't quite accurate. He said the capacity of the system was 126,000,000. That contemplates for this year after certain additions are made.

Q. You are going to make additions?

A. Additions to the stations are now being made as I understand.

Q. What is the capacity now?

A. Well, before the stations had been increased, about 107,000,000 feet.

Q. What effect do you think this national defense situation is going to have on your load?

A. Here?

Q. And all up and down your line.

A. I have made no study of that. I don't know to what extent the Colorado fuel business would increase on that account nor to what extent business here in Denver will increase on that account.

Q. Now, let's go to our electricity situation.

Who sells electricity in Denver, Colorado, do you know?

A. Public Service Company of Colorado.

Q. Is that the same outfit that sells the gas in Denver?

A. Same corporation, I understand, yes.

Q. You know it, don't you?

A. I do.

Q. Well, do you think that company is going to compete with itself?

A. I have nothing to do with the management of that company.

Q. Well, as an engineer would you think that it makes much difference one way or the other whether people use electricity or gas to the Public Service Company of Colorado?

A. Well, I don't know what difference it would make economically; that is, I have never made any studies. They sell both. I think their cooking business here in Denver is largely gas.

Q. Do you know why that is?

A. Well, it's cheaper. Gas is cheaper than electricity. I think it is better.

Q. Well, there can't be very much competition between gas and electricity in Denver in view of the fact that one outfit has got the exclusive right to sell both, can there, only as a commodity?

A. Well, I wouldn't expect to find much competition between the sale of energy for domestic cooking in Denver unless the—unless the one company selling both services had decided on that policy.

Q. When you brought your gas into Denver here and your contract to construct the line, did you have any part in negotiation of the contracts of Public Service of Colorado?

A. Not the original contracts.

Q. Who did have?

A. I don't know. I say I do know. Mr. Christy Payne, I think had a prominent part in the negotiations.

Q. Of Standard Oil Company (N. J.)?

A. Of Standard Oil. I would say that Mr. Joe Creveling undoubtedly had an interest in them and whoever is the head of the Public Service of Colorado here. I've seen the contract, the signature is on it. I didn't participate in the original negotiations but did in certain subsequent ones.

Q. Now I direct your attention to Exhibit 36-G. I note from an examination of that exhibit, Table 7, as far as I can see there has been a consistent increase in the total sales of gas in Denver from 1929 to 1939, with the exception of one year which was 1938, is that correct?

A. That's correct. While these sales are totals, I think that Denver followed the trend. I'm not sure but I think it is a fair assumption that it did.

Q. You don't know whether it followed the trend or not?

A. I think—well, I couldn't swear that it did, but I'm sure that it did.

Q. I note here, though, that the increase from 1938 to 1939 was rather large. Do you know what accounted for that?

A. We had a fall-off industrial activity in 1938, apparently.

Q. That's what knocked that load down?

A. Yes, it looks like it.

Q. You don't know, though?

A. I would say the sale—I would say because the sale for all other purposes accounted for the difference.

Q. Now I notice here you go over to your coal production in Colorado, tons, that column. As I see there there has been a consistent decrease in the amount of coal production in Colorado during this same period.

A. Well, I wouldn't quite hardly say that because in the middle of the period there you will notice some increases but—

Q. It slipped back, though, didn't it?

A. It then did, yes. It has, of course, shown a substantial decrease from 1929 and 1930 to the present.

Q. Yes, about four million, wasn't it?

A. Almost, production in Colorado, yes.

Q. About ten million tons down to about six million tons in 1939. How do you account for that?

A. Increase in competition of other fuels and more efficient uses of all fuels.

Q. In other words, gas was taking the market away from them?

A. Gas was one of the contributing causes without question.

Q. Let's see, did you state in the record the method that you used in computing the tables here?

A. Just take the total therms, the total Btu's. and—the total Btu's. in gas and divide it by the Btu's. in a ton of coal and you will get the resulting displacement of coal. Divide that displacement by the coal production and you will get a percentage.

Q. I think you stated where you get this information from here.

A. I got the sales of gas from the Colorado Interstate Gas Company from Mr. Drew. The coal production is shown how I got that in another exhibit. The rest of it is just arithmetic.

Q. What's that other exhibit? I don't think you stated.

A. Exhibit 36-A.

Q. Natural gas—according to your schedule here it has been able to hold up pretty well against this coal competition, hasn't it?

A. Yes, it has done pretty well.

Q. In fact, it has got the better of the deal according to these figures, didn't it?

A. Just what do you mean by that?

Q. I mean that there has been a constant increase in gas consumption and constant decrease in coal consumption?

A. Yes, sir.

Q. Is there anything to indicate to you that that ratio won't be maintained?

A. Yes.

Q. What's that?

A. The capacity of the whole Interstate system.

Q. In other words, you come right back to the proposition that you are practically operating to capacity now.

A. I say we are operating at peak capacity; that is, on peak days. Of course on non-peak days there is still room for substantial volume of additional business by way of leveling out the total factor and increasing the load sales without increasing the peak-day requirement.

Q. You couldn't take care of a 12-months period, any additional load?

A. We would have to be privileged to shut off this additional business on peak days or else increase the facilities required to bring that much additional gas to Denver on a peak day.

Q. I don't know whether I asked you yesterday or not, but why is it that Colorado Interstate Gas Company hasn't attempted to sell more residential, small residential service all up and down this line, the small towns?

A. You said we hadn't attempted to?

Q. Have you attempted to do it?

A. We don't control the sale of gas at any of these small towns up and down the line.

Q. The Public Service Company of Colorado controls them?

A. Controls Pueblo.

Mr. Dougherty: Right there, Mr. Hill—

The Witness: That is, Pueblo Gas & Fuel. It's another subsidiary of the City Service Organization.

Mr. Dougherty: Also, Mr. Hill, I want to call your attention in connection with your statement that the basis of 36-G was 36-A. Mr. March mentioned it was 36-B. 36-B has the year 1939 and the full year 1938 which is not true of 36-A, so Mr. March was correct.

The Witness: I stand corrected.

By Mr. March:

Q. Now, let's take up this coke situation. All you know about coke production is what you have read from publications?

A. No, I used to be around Pueblo a lot when we were putting gas in and I know that quite a bit of domestic coke is sold there which is made by the Colorado Fuel & Iron in their ovens and sold for domestic use.

Q. Why don't they use coke themselves if it is so cheap?

A. For what?

Q. For their own use.

A. They can't use it for open hearth purposes.

Q. They have to use electricity and gas or what?

A. For open hearth purposes you've got to use some *some* form of gaseous or liquid fuel and a very great part of the gas sold to the Colorado Fuel & Iron is used for melting steel in the open hearth furnaces. The balance is used for miscellaneous operations such as soaking pit operations and some is used for boiler fuel. Now the amount of coke produced down there that is sold is simply a product of their own operations, which was largely sold in those days to company employes. Now what the situation is now I couldn't say. As to whether its use has increased or not as far as company employes is concerned or others, other than what is shown in this table, I couldn't say.

Q. Does coke compete very much with gas in the Denver market?

A. No.

Q. What market does it compete in?

A. Pueblo.

Q. What is the extent of that competition in Pueblo?

A. I haven't reduced it to gas equivalent, but it is—at least I know in the early stages of the company's life it was confined largely to employes of the Colorado Fuel & Iron. I don't consider it a serious competitor at all.

Q. Have you made a study of that situation up in Cheyenne?

A. No, sir.

Q. In regard to any type of fuel competition?

A. No, sir.

Q. Now I notice you have annual oil production in

thousands of barrels, 1925 to 1938, on Page 11 of your testimony. That oil production is comparatively small, isn't it, in the state of Colorado?

A. Small in Colorado.

Q. In fact, it is very small, isn't it?

A. Yes, sir.

Q. Do you know how high Colorado ranks?

A. Oh, it's very small.

Q. Negligible?

A. Yes, sir.

Q. Where would the chief fuel oil—most of the fuel oil be produced that competed, or crude oil which competed with gas in the Denver market?

A. Wyoming and Kansas, principally Wyoming.

Q. Wyoming—you don't know whether it competes up there in Cheyenne very seriously or not, do you?

A. Well, let me see if there is a refinery in Cheyenne listed here. If not, I would say not as much as in Denver.

Q. You don't know, though?

A. I will try to answer. No, I would say that the competition of Cheyenne in oil shouldn't be as great as in Denver because there is no refinery there. It isn't listed anyway.

Q. Would you say Wyoming had very much oil production?

A. Yes, sir.

Q. How does it rank among the states of the Union?

A. I don't know.

Q. Do you know who owns most of the oil leases up there in Wyoming?

A. No, sir.

Q. What company?

A. No, sir.

Q. What part of Kansas would oil competition come from?

A. Northern and Western fields in Kansas.

Q. Do you know who owns most of those oil leases in that portion of Kansas, what company?

A. I know The National Refining Company owns quite a bit. There are other companies, the Continental is represented in there; the Phillips Petroleum—

Q. Texas?

A. City Service.

Q. All of these companies which control Colorado Interstate Gas Company and Canadian River Gas Company?

A. No, no, no, no. Standard Oil of New Jersey isn't represented in the state of Kansas except they had representation there with the Carter Oil Company which is a producing subsidiary. Sinclair, I believe would have.

Q. They have some, Sinclair?

A. Sinclair would have some.

Q. Texas?

A. Texas hasn't got anything to do with this setup here—Texas Corporation?

Q. I just asked you about the Texas Corporation.

A. Oh, they are in there, sure.

Q. City Service?

A. I would expect so.

Q. How's that?

A. I would expect they would have a foot-hold in those fields.

Q. Do you know how much crude oil is shipped to the Denver markets from those fields, fuel oil?

A. No, I don't.

Q Do you know whether it is small or large?

A I would think it would be almost negligible now that the pipe line from the Lance Creek field was built into Denver.

Q. Who built that pipe line?

A. The Rocky Mountain Pipeline Company.

Q. Who controls that company?

A. I don't know.

Q. What is the capacity of that line?

A. 6-inch line.

Q. It comes into Denver?

A. It comes into Denver.

Q. Do you know—

A. The capacity depends on the pressure. I'd say that perhaps 15,000 barrels a day.

Q. Do you know at what capacity it operates at?

A. No.

Q. Do you know what they charge for their oil wholesale on that line, gate rate?

A. No. I wouldn't know. I didn't know there was a gate rate.

Q. Wholesale rate, I mean.

A. The tariff on the transportation from Lance Creek to Denver I don't know. You mean the tariff on the transportation from Lance Creek to Denver?

Q. You state here on Page 33 of your testimony—

The Trial Examiner: May I interrupt you just a moment before you get off 36?

Mr. Hill, you do not mean to infer that the total amount of crude petroleum production shown on Exhibit 36-D is converted into competitive fuel oil, do you?

The Witness: No. The figures given on the left-hand side of the tabulation are simply production of crude petroleum in thousands of barrels.

The Trial Examiner: You don't mean to infer from that that the total production shown is converted to fuel oil for competitive purposes?

The Witness: Oh, no, of course not. That is, only a portion of that would be reduced to fuel oil.

The Trial Examiner: Proceed.

By Mr. March:

Q. How much is produced?

A. Depending upon the process.

Q. You don't know?

A. Well, of course no one knows the total.

Q. Now, on page 13 I want to ask you about that schedule there. You said those figures were reasonably accurate. What do you mean "reasonably accurate"?

A. What page did you give me?

Q. 13. The table on page 13, estimated proven crude oil reserves in Colorado and adjacent states, data from American Petroleum Institute.

A. Well, those of course are estimates.

Q. That is the sense in which you submit that to be reasonably accurate?

A. Where did I use that? I don't see that in my testimony. I may have interjected it.

Q. I put it on my paper here when you interjected it as I recall it.

A. I don't recall it, but I'd say they are estimates and of course subject to errors that all estimates are subject to.

Q. On Page 18 I want to direct your attention to your testimony. I believe you testified that that estimate there was based upon a letter which you received from Mr. Morgan?

A. Yes, sir.

Q. I wonder if you would produce that letter for the record in order to make the record complete?

A. Yes. It is in our files in New York. I'd be glad to get it for you. Will a photostatic copy be all right?

Q. A photostatic copy will be just fine.

Oh, yes, you said on page 19 there is also a natural gas pipe line between Cheyenne and Denver supplying gas from the Colorado Interstate Gas Company's line to Cheyenne, Wyoming, and intermediate points. Is that the Colorado-Wyoming Gas Company line?

A. Colorado-Wyoming line, yes, sir.

Q. Do you know who controls the Colorado-Wyoming?

A. It is a City Service Interest. I don't know just what company controls it.

Q. Do you know if the Public Service Company of Colorado is a Cities Service interest too?

A. I so understand, yes.

Q. Do you know how much the Cities Service, what interest it has in the Interstate Natural Gas Company?

A. Fifteen per cent of the common stock; that is, the interests of the Public Service Company of Colorado.

Q. Yes.

A. I understand it to be fifteen per cent.

Q. Do you know how they vote that stock?

A. I don't know.

Q. How did they vote it when you were managing the properties?

A. I don't know.

Q. How's that?

A. I never had any occasion to find out.

Q. I think I used in asking that last question I used "Interstate Natural Gas Company." It is Colorado Interstate Gas Company.

A. Colorado Interstate Gas Company.

Q. Now I want to ask you, referring to your Exhibit No. 36-L, you see the line in red there. As I understand it they are oil pipe lines?

A. Yes, sir.

Q. Can you tell us what companies operate those oil pipe lines?

A. The line from the Southeastern part of Wyoming going on down to the Southeast is the old Sinclair Teapot Dome line. Just how that is being operated today I couldn't say. It has been operated at various times by Sinclair and I think it is so operated now.

The line coming down from Lance Creek into Denver as I understand it is owned and operated by the Rocky Mountain Pipeline Company.

(Vol. III, pp. 411-463.)

• • • • •

Q. Do you know anything about the price structure of coal, market prices of coal?

A. What I have shown in my exhibit.

Q. Do you know anything about the law affecting the price of coal?

A. No.

Q. Do you know there is a law recently passed which is going to fix a minimum price for coal?

A. I have heard there was.

Q. Do you think that is going to have some effect on your competition with coal?

A. If the effect of the law tends to increase the retail delivered price of domestic coal in the City of Denver I think that the number of house heating customers using natural gas in the City of Denver will increase and along with that increase will go an increase in the amount of natural gas used for house heating.

Mr. Dougherty: That is assuming that the same gas price—

The Witness: No change in the gas price.

By Mr. March:

Q. But if the gas price goes down there will be considerably further increase in the use of gas?

A. Well, leave out the word "considerably." I don't know, I couldn't measure the intensity, the amount of gas.

Q. Very substantial?

A. If the change in the coal-gas price ratio is substantial the effect on the company's house heating load will also be substantial.

(Vol. IV, pp. 576-577.)

The witness Sands, from the reports filed by the City of Colorado Springs for its distribution system and by the distributing companies, Public Service and Pueblo Gas and Fuel with the Public Utilities Commission of Colorado, made the following summary of the increase in sales of natural gas by said distributors from 1927 to 1939. He also included a comparison for those years of the revenues received by the distributing companies. These increases are set forth in the following table: (Exhibit 296, p. 12).

	"Mcf. Sold	Millions Btu.	Revenue
1927			
Denver District	3,252,107	1,066,691	$2,373,335.35
Colorado Springs	117,402	44,613	186,170.93
Pueblo	118,510.6	39,583	172,233.07
Total 3 cities	3,488,019.6	1,150,887	$2,731,739.35
1939			
Denver District	8,025,148	6,524,445	$4,379,766.00
Colorado Springs	888,394	704,496	362,590.77
Pueblo	462,690	383,107	306,615.71
Total 3 cities	9,376,232	7,612,048	$5,048,972.48
1939 times 1927	2.69	6.61	1.85"

---

12. Preferential Service to Domestic Consumers Over Industrial Consumers.

The project parties in their first agreement of April 5, 1927, Exhibit 1 herein, provided that in all the contracts made to carry out the project,

> "it is to be stipulated that the demands of domestic consumers upon the supply of natural gas are to be

preferred over service to industrial consumers and that the remainder may be prorated, after demands of domestic consumers, among commercial and industrial consumers, but that such domestic preference shall not be exercised so as to deprive the Colorado Fuel & Iron Company of the volume of gas needed to complete open hearth heats then in jeopardy and to keep its furnaces warm during exrreme domestic demand upon the pipe line of the Colorado Company, or so as to deprive any other industrial consumer which requires a small proportion of its normal gas demand to prevent damage to its appliances." (Exhibit 1, p. 15).

The complaint herein, the City of Denver itself, in its ordinance of September 14, 1927 (Exhibit 25), recognized the same preference and stated that the Public Service Company of Colorado could charge industrial consumers rates,

"lower and different from those charged for domestic purposes and the Company shall have the right to contract with industrial users for the sale of such natural gas, provided that all such contracts contain a 'cut-off' clause which recognizes the preferred right of the domestic users over the industrial users." (Exhibit 25, p. 5).

The City of Pueblo, in Section 8 of its ordinance of February 20, 1928 (Exhibit 39, p. 4), also recognized this preference in language almost identical with the Denver Ordinance, as follows:

"It is further determined that the rates to be charged by said company for natural gas service to industrial users for heating, manufacturing and power purposes in the City of Pueblo may be lower and different from but not higher than those charged for domestic purposes and the company shall have the right to contract with industrial users for the sale of such natural gas, provided that all such contracts shall contain a 'cut-off' clause which recognizes the preferred right of the domestic users over the industrial users."

The City of Colorado Springs in Article Eighth of its contract of June 12, 1931 with respondent for the purchase of gas at the city gate for distribution through its municipally owned system (Exhibit 7-E) and in its rate schedules quoted

to its customers made the same distinction and preference. Article Eighth of that contract provides:

> "It is mutually understood and agreed that the requirements of domestic consumers of the City shall be fully supplied from the natural gas delivered hereunder in preference to the City's power plant or plants and in preference to consumers purchasing natural gas for industrial or commercial purposes, and that Vendor can be required to supply natural gas to be used for industrial or commercial purposes only where the same is sold under contracts which have been first submitted and approved in writing by the Vendor and which expressly provide that the natural gas will be supplied thereunder only insofar as the same is not necessary to meet the requirements of domestic consumers supplied by the Vendor * * *."

All of the other contracts of the respondent and of Canadian for the sale of gas contain a similar provision. These contracts of respondent, other than that with Colorado Springs just referred to, and cut-off provisions therein are as follows: Exhibit 7-I, contract with Public Service Company of Colorado dated January 3, 1928, Article Twelfth, p. 17; Exhibit 7-H, contract with Pueblo Gas and Fuel Company dated January 3, 1928, Article Tenth, p. 14; Exhibit 7-F, contract with Colorado-Wyoming Gas Company dated October 3, 1929, Article Seventh, p. 14; Exhibit 7-D, contract with Citizens Utilities dated May 1, 1937, Article Ninth, p. 15. Exhibit 9 contains the following contracts: American Crystal Sugar Company dated January 1, 1939, Article Seventh, p. 11; Atchison, Topeka & Santa Fe Railway Company dated November 23, 1929, Article Seventh, p. 10, Colorado Fuel & Iron Corporation dated February 19, 1937, para. 5, p. 4; Colorado Portland Cement dated October 22, 1930, Article XI, p. 11; United States of America dated August 2, 1929, Article Seventh, p. 9; and Veterans Administration Facility dated May 12, 1939, p. 8.

The respondent's customer, Colorado-Wyoming, has similar provisions in all of its contracts. (See Exhibits 102, 103 and 104.)

The witness, William R. Beardsley, who has been superintendent of the meter department of the respondent since

it began business in June, 1928, prepared from company records a statement of all total and partial interruptions of service and line breaks of both respondent and of the Canadian Company from the beginning of service in 1928 to December 31, 1940. His statement was admitted as Exhibit 290. This witness has had superintendence of the metering and measuring of all gas sold by respondent for industrial or commercial, and domestic use and has custody of all records showing such sales and of all records of interruptions to service of all kinds. (Vol. VII; pp. 942 to 954; Vol. XCVIII, pp. 15202 to 15213.)

In Exhibit 290 there is included all instances of line breaks or other casualty and of peak loads resulting in interruptions to or reductions or suspensions of service to industrial or commercial customers served by respondent directly or by distributing companies purchasing from respondent. As abstracted hereafter, there was no reduction or suspension of service to domestic consumers because the gas stored in the line, or as it is sometimes called, the "line pack", was sufficient to supply the domestic users after the industrial or commercial users were cut off or their supply reduced. In this connection reference is made to Rhodes' testimony (Vol. IX, p. 1226) and his Exhibit 66, p. 17, where he states:

> "Furthermore, gas can be drawn from the line in excess of its true or continuous capacity through the skillful use of the storage capacity of the line. In long pipe lines a considerable amount of gas is stored in the line on account of the high pressure at which it operates. This stored gas under proper control may be used to supplement the flow capacity of the line to an extent of about 10 per cent for a single day."

And to the same point reference is made to Exhibit 145 of the Commission's witness Kenneth L. Smith, p. 2, where he states:

> "According to information received from the Bureau of Engineering, the average line pack during the year 1939 was 55,362 Mcf., at a pressure base of 16.4 pounds per square inch absolute."

In Exhibit 290 the following "Statement of Reductions or Suspensions of Service to December 31, 1940" is set

forth. In each case each reduction or suspension is described as being a reduction in deliveries to industrial customers to conserve domestic gas and will not be repeated:

Customer	Date	Duration	Cause
Colorado-Wyoming Public Service of Colo. City of Colorado Springs	7/29/32	24 Hours	Washout on Main Line

There is also set forth "Statement of Total Interruptions in Service to December 31, 1940" of Canadian as follows:

Customer	Date	Duration	Cause
Amarillo Oil Co. at Metering Station, Dalhart, Texas	6/ 3/32	6 to 7 Hours	Washout on Main Line
Amarillo Oil Co. at Metering Station, Texline, Texas	6/ 1/37	36 Hours	Washout on Main Line
Colorado Interstate Near Clayton, N. M.	6/ 1/37	26 Hours	Washout on Main Line
Colorado Interstate Near Clayton, N. M.	6/ 2/37	12 Hours	Washout on Main Line

There is also included for both Canadian and Colorado a complete record of line breaks.

Beardsley explained that because of gas stored in the line or the "line pack" the cutting off or cutting back of service to the industrial or commercial consumers always permitted service to the domestic users (Vol. XCVIII, p. 15208).

Interruptions on the Colorado-Wyoming line were as follows:

In July, 1932, all of the industrial customers were affected although domestic service was maintained by resorting to gas in storage in the line. This was caused by Jimmy Creek Washout. (Vol. XXVIII, p. 3876.)

In the fall of 1934, all industrials were cut off for eight hours. Later in 1934 all industrials cut off eighteen hours. (p. 3877).

In May, 1935, all industrials cut off for twenty-eight hours. (p. 3877).

In December, 1935, there was a five-hour cut-off of "certain customers, occasioned by a line of Colorado-Wyoming Gas Company being broken by a blast." (p. 3877).

On February 5, 1937, due to hydrate stoppage in Colorado Interstate's line, all main line industrials were off sixteen hours and resale industrials were off ten hours. (pp. 3877, 3878).

On February 9, 1937, due to break in Colorado-Wyoming's line from a blast, all main line industrials were off eight hours and resale industrials were off three hours. (p. 3878).

In the latter part of May and early part of June, 1937, due to a washout at Little Perico in Texas, all main line industrials were off for three and one-half days. Resale industrials were off three days. "Domestic service, however, was maintained." (p. 3878).

On January 18 and 19, 1940, all main line industrials discontinued and resale industrials were cut off January 18 to the extent of 705,000 cu. ft. and on January 19 to the extent of 164,000 cu. ft. (p. 3875).

On November 12, 1940, Colorado Portland Cement was cut off from 10:00 P. M. November 12, to 8:00 A. M. November 13, 1940 (p. 3875).

The witness then stated:

> "That, I believe, brings the interruption record down to date with the exception of a few minor interruptions purely local in character, such as the particular supply line being torn out by road construction work or items of that kind. * * *
>
> "Q. Were there any interruptions at all in any domestic service since 1929?
>
> "A. The only interruption which comes to my mind, and it is not a total interruption, is a slight reduction in pressure in certain parts of Cheyenne during the

January 1940 peak day. The town border pressure there with all industrials off and with even the high school building in Cheyenne off for heating purposes, there was a few customers affected at that time." (pp. 3878, 3879).

The witness, Hendee, now manager of respondent and also of Canadian, testified as to many of the instances in which industrial or commercial users had been cut off or their supply reduced during his term of management. (Vol. III, p. 310, et seq.) He stated that it was not always necessary to cut off the industrials but that the domestic load could be maintained by simply "cutting them back"; but if the domestic customers were in jeopardy, he would cut off the industrials. (pp. 318, 319, 320). The cut-off in January, 1940, was for a few hours at first and then had to be repeated in a couple of days. Colorado Portland Cement was using enough gas to keep their appliances warm. The Santa Fe Railroad was using a small amount for the same purpose and Colorado Fuel and Iron was cut back from about 25 million to 14 or 15 million cu. ft. (pp. 320, 322). He made it a practice during sudden cold spells to notify the respondent's direct sale industrial customers in advance if possible that they would be cut back or cut off. (pp. 330, 331). If the peak load situation gets worse in the winter months, he would have to cut off the industrials more frequently. (pp. 335, 336). When asked if they couldn't build more lines, he replied: "Yes, but it may be cheaper to cut off industrial gas than to add looping of lines and so forth." (p. 336). When there was a shortage of gas due to peak loads, he would request the distributing companies to whom respondent sold at the town or border gate, including Colorado-Wyoming, to cut off their industrials. He made his request of Colorado-Wyoming in that manner and that company handled the cut-offs along its line. (pp. 337, 338).

The witness Rhodes also testified as to the cutting off or the reduction in supply of gas to industrials to serve domestic customers. (Vol. XXXII, pp. 4439, 4440; Vol. VIII, pp. 1146, 1147).

A record of all the occasions on which such deliveries to industrial customers were either cut off or reduced, in order to continue service to the domestic users, was supplied to the Commission prior to the hearing according to Beardsley.

"Q. And previously at the request of some of the engineers of the Federal Power Commission, did you give them substantially what is on this sheet?

"A. Yes, sir, the information was originally prepared at the request of Mr. Wing of the Federal Power Commission." (Vol. XCVIII, p. 15207).

The Commission's witness Lester prepared Exhibit 251, "Report on the Review and Analysis of the Contracts, Rates and Billings of Colorado-Wyoming Gas Company" and similar Exhibits 261 and 262 for Canadian and Colorado Interstate respectively.

On being cross examined on his Exhibits 261 and 262 respectively, by counsel for Canadian and Colorado Interstate, his attention was called to page 9 of his statement with respect to Exhibit 262:

"* * * you make certain reference to certain curtailments of service and have stated that that has never taken place because of the shortage of gas supply in the field, but that there have been certain interruptions because of line breaks and some domestic peak loads.

"Now, so far as the industrial customer is concerned, to him the curtailment of his gas is substantially the same thing whether that is caused by a shortage of supply from break in the line or shortage of supply available to him because of increase in demands for domestic customers, would that not be so?

"The Witness: As far as he is concerned, that might or might not be so. What I am driving at is that one would be classed as act of God and another one would be your request due to high domestic peaks.

"Q. Well, when you have a break in the line and in order to keep up whatever your domestic load is at that time, then it becomes necessary to shut off or curtail the industries?

"A. Yes, that is necessary, too.

"Q. That is, whether the lack of capacity is due to increased demands of domestic customers or lack of capacity due to a break which lowers your normal capacity, the result is the same in either event to the industry?

"A. Yes, it could be the same.
"Q. He doesn't get his gas.
"A. I was referring rather to the cause." (Vol. C1, pp. 15645, 15646.)

Q. I see. Now turn to Page 10, will you please? You make reference there in the second paragraph; that is, the first full paragraph on the page, that the gas which is sold for resale to the Denver line has preference over that which goes to the Chicago line but that the gas sold to the Chicago line is at a higher price.

Now, as far as the Canadian River Gas Company is concerned, doesn't it get the same price for gas from the Colorado Interstate Gas Company that goes to Chicago as well as to Denver?

A. Since June the 1st, 1938, that is correct.

Q. Previously the statment you made was true; that is, before that date?

A. Before that date, but it is true that—well, as far as Canadian River goes, but as far as Colorado Interstate that is not so.

Q. Well, what Colorado Interstate does is sell gas to the Chicago line at a fixed price?

A. That is correct, and it is higher than the average price that is delivered to the two lines.

Mr. Lange: You mean higher than the average price delivered to what lines?

The Witness: To Chicago line than to the Denver line.

By Mr. Dougherty:

Q. Turn to Page 13-B, please. You make reference there at the top of the page to a provision whereby the Arkansas Valley Natural Gas Company was to maintain a certain pipe line that went through the Arkansas Valley. Is it your understanding that that contract has now been terminated?

A. That contract has been terminated but in my Exhibit 262 there are certain charges that result from this part of the contract and I have retained it for that purpose.

Q. Now, if you will turn to your group of schedules under Exhibit 262, Table R-4, Sheet 8, you show there the sales to

Natural Gas Pipeline Company of America and show the annual load factor as 73.66 per cent.

Can you tell me what figures you used to arrive at that percentage? The reason I asked, it is a different percentage than the company's records indicate and I am trying to find out where your difference was.

Mr. Lange: Mr. Lester, if it is going to take some considerable time, then I would suggest to the Examiner that we recess early and convene earlier.

The Trial Examiner: How long is it going to take?

The Witness: If I can lay my fingers on the computation, I can do it right away soon.

The Trial Examiner: I take it, Mr. Dougherty, you would like to complete with Mr. Lester now?

Mr. Dougherty: I would, yes, because I was planning on leaving this afternoon and thought I wouldn't come back.

That, however, is the last question I have. I was merely trying to get his figures. The peak day he used and what average day he used for the purpose of getting the annual load factor, is what I wanted.

The Witness: Well, the average day would have been a division of the total consumption by the number of days in the year and the other—that's what I'm looking for here is to find the peak day that—

Mr. Dougherty: I'll tell you what could be done. As I say, that's all the questions I had and that information can be put in the record even though I am not here, and if you will get the peak days that you used for each of the 1937, 1938 and 1939 years, the date and the quantity and just merely put that in the record, it will be satisfactory.

(Vol. CI, pp. 15646-15649.)

In the cross examination of this witness with respect to the analogous Exhibit 251, the matter of the preference of the domestic over the industrial consumers was also brought out by counsel for Colorado-Wyoming. Counsel moved to

strike pages 8 and 8-A of the witness' statement describing Exhibit 251, reading:

> "There have been no interruptions in the Colorado-Wyoming Gas Company's domestic and industrial service at the same time, although domestic service on branch lines has at times been interrupted due to line failure. Industrial service has at times been totally interrupted or reduced so that domestic service could be maintained when washouts or other accidents have affected the pipe line of the Colorado Interstate Gas Company."

Then counsel inquired:

> "Now the facts are, are they not, Mr. Lester, that there has been curtailment and shutoff of industrials to satisfy domestic peak demands when there has been no accidents or washouts of any kind, just simply because there wasn't enough gas in the line to satisfy both demands?
>
> "The Witness: The company did not so furnish me that information and they say it was not of record nor did they know the exact time or period when it did occur." (Vol. LXXXVI, p. 12909).

But on cross examination, when his attention was directed to letters from the company to the Commission dated February 25, 1941, in answer to the Commission's letter of February 24, 1941 (p. 12911) and letter of May 29, 1940, in answer to the Commission's letter of May 9, 1940 (p. 12912) and letter of December 11, 1939, in reply to the Commission's letter of October 19, 1939 (p. 12916), the witness acknowledged that such instances had been brought to the attention of the Commission. On request he read into the record the reply letter of October 19, in which it was stated:

> "I also have in mind several occasions when the domestic peaks were so heavy that industrial plants were asked to reduce their takes during the period of the peak (from one to three hours) after which they were permitted to resume full load operations. No record of such instances has been kept and we are unable to furnish dates and amount of reduction on those occasions." (Vol. LXXXVI, p. 12916).

Further Testimony of the Witness Lester in Connection With the Foregoing Matters.

Cross-Examination.

By Mr. McCreery:

Q. Mr. Lester, what is the purpose of this exhibit?

A. It is to show the charges and rates that the company actually charges on its books.

Q. What does it show?

A. It shows what the charges have been.

Q. What conclusions did you undertake to present by this exhibit?

A. Set them forth for the information that they might contain for the Commission as to what the company has actually charged on the books and the rules and regulations surrounding the rates that it has used in setting up its billings to its respective customers and condensed them into a yearly basis.

Q. It is really your construction of what the operations have been, isn't it?

A. No, it is actually the construction.

Q. You mean that your statement here is other than your conclusion?

A. That is a statement of the things that have been billed and the quantities of gas sold as reported by the directors of the company.

Q. You arrive at certain conclusions, do you not, in this statement and this exhibit?

A. I possibly have arrived at certain conclusions.

Q. If you have, they are your own?

A. That is right.

Q. Now, will you tell me what your definition of load factor is?

A. Load factor is the variation of the average load from the maximum load over a period of time expressed generally in a percentage.

Q. Now, what period of time did you use?

A. One year's time.

Q. Now, in connection with the industrials you used the full period of a year irrespective of the portion of the year in which the industrials were actually utilizing gas, did you not?

A. Yes. The load factor of mine was for a year. Now, I didn't define my load factor as only using that period of a year deducting from the total year only that period of the year for which it had been used. If I had of, I would have got a load factor for perhaps 200 days or 300 days.

Now, we have load factors for months, weeks, days, years, five years, ten years—any period. The stated period of time of mine is a year.

Q. I just asked you what period you used.

A. I just wanted to protect from the question that you may lead to that you are talking of a load factor or perhaps of an output factor. You are perhaps talking of an output factor. I just wanted to keep that straight.

Q. Now, the answer is that you gave no consideration to actual days upon which industrials took gas but treated them as though they took it 365 *years* a year?

A. I followed the definition of the load factor of a year.

Q. That's what you did?

A. I used it for a year, yes.

Q. On that basis?

A. Yes. I wasn't building up an output factor. That's what I'm trying to keep you straight on, your load factor and your output factor.

Q. Now, you state on Page 8-A of your statement that "No records have been kept of occasions when domestic peaks were of sufficient magnitude so that industrial cases were necessarily reduced during the peak load periods." What do you mean by that statement?

A. Why, the company kept no records, only of the information that they had furnished me and which is a table in the exhibit and that is all that they said they had records and data on.

Q. Aren't you mistaken on that, Mr. Lester? All of the meter charts would show exactly what curtailments had been made to satisfy domestic requirements. While they don't have any book records of it, their metered charts would show that, would they not?

A. I believe this was taken directly from the information furnished to me from the company and a direct quotation from them.

Q. I asked you if that information isn't available from metered charts.

A. It may not be. The company informed me that it was not, said no data was kept of it.

Q. No data given?

A. I am sure that statement was taken directly from the company.

Q. These various communications that were made to the Federal Power Commission on that very subject—here is a letter of December 11, 1939, addressed to Mr. O'Connor, Federal Power Commission, in answer to a letter by him to the company of date October 20th, in which the writer, the Vice President and General Manager, says:

"I also have in mind several occasions when the domestic peaks were so heavy that industrial plants were asked to reduce their takes during the period of the peak (from one to three hours) after which they were permitted to resume full load operations."

Now, then, the next sentence is: "No record of such instances has been kept and we are unable to furnish dates and amount of reduction on those occasions."

Did you ask at that time or any other time to see the meter charts?

A. No, I assumed that one request for information would have the same effect as two. I didn't see that two requests would have any more benefit than one, and my quotation I used in there reflects directly—refers directly to that latter sentence that you read from the letter.

Mr. Lange: What is the date of that letter, Mr. McCreery?

Mr. McCreery: That is December 11, 1939, Mr. Lange.

Mr. Lange: Do you have that correspondence with you, Mr. Lester?

Mr. McCreery: His quotation refers to the same letter that talks about industrials to take care of domestic peak demands.

The Witness: I have that.

Mr. Lange: In order to make the record complete, Mr. McCreery, you might read that whole letter into the record.

Mr. McCreery: It will be quite all right, but I am not interested in it at this particular time. I have got some more. I have no objection to it, but I am interested in this witness' statement on Pages 8 and 8-A:

"There have been no interruptions in the Colorado-Wyoming Gas Company's domestic and industrial service at the same time, although domestic service on branch lines has at times been interrupted due to line failure. Industrial service has at times been totally interrupted or reduced so that domestic service could be maintained when washouts or other accidents have affected the pipe line of the Colorado Interstate Gas Company."

Now the facts are, are they not, Mr. Lester, that there has been curtailment and shutoff of industrials to satisfy domestic peak demands when there has been no accidents or washouts of any kind, just simply because there wasn't enough gas in the line to satisfy both demands?

The Witness: The company did not so furnish me that information and they say it was not of record nor did they know the exact time or period when it did occur.

By Mr. McCreery:

Q. In the very letter you are relying on they do state just what I read, do they not, where it says: "I have also in mind several occasions when the domestic peaks were so heavy that industrial plants were asked to reduce their takes during the period of the peak (from one to three hours) after which they were permitted to resume full-load operations."?

A. He said he had that generally in his mind but he couldn't put his finger on any point. Sometimes the memory isn't quite so good and you have to get down to the actual date in order to nail it.

Q. That is what we are undertaking to do right now, Mr. Lester.

A. So I based mine on the information furnished me by the company.

Q. Well, do you know as a matter of fact whether or not

there were such curtailments and cutoffs to satisfy peak demands of domestic consumers?

A. They didn't furnish it to me at that time.

Q. I asked you if it is a fact.

A. At the time that letter is written?

Q. Yes.

A. No, not to my knowledge, and no information was furnished me by the company, although it was definitely requested that it be furnished. I was relying on the company's information.

Q. The answer is in this letter that there were those shutoffs.

A. He couldn't place it. I don't know whether it is or whether it is not. He says, "Oh, yes, I can recall to mind," but he hadn't recalled it to mind when it was.

Q. Are you familiar with similar correspondence between the company and the regional director in the year 1940?

A. I think I have seen that correspondence. Now, definitely I don't know whether I am thinking of the same correspondence that you are talking about there because I haven't the correspondence you are referring to before me.

Q. I will identify it very shortly. Your exhibit is dated October 1940?

A. Yes.

Q. Did you ever read a letter of date February 25, 1941, for instance, in answer to a letter of date February 24th, 1941 in relation to shutoffs to supply domestic peaks during certain portions of the year 1940?

A. When did the date of the shutoffs begin?

Q. These were late in 1940, subsequent to the date of your exhibit.

A. Yes, I have seen that.

Q. And that letter you recall indicated that on November 12 and 13, 1940, the Cement plant, to protect the Cheyenne load during severe cold, was curtailed and the plant ordered out on November 12th at 9:00 p. m., and service resumed at 8:00 a. m., November 13th and on December 12th to 14th, 1940, the Cement plant was curtailed during the period of December 12th, 13th and 14th; from the 12th from 5:00 p. m. to 10:30 p. m., curtailed 800 Mcf.; on December 13th from 10:00 a. m. to 6:00 p. m., curtailed 1500 Mcf., and that on December 14th, rather than suffer further curtail-

ments, they shut down completely at 6:40 a. m. of that day? Did you see that letter?

A. Yes.

Q. You didn't desire to embody it?

A. I was restricting it to the period of that time in my exhibit. If you want to bring that up to date and include that information, it's all right with me. Had I had it I would have included it.

Q. Now, did you also see a letter of May 29th, 1940 in answer to a letter of May 9th, 1940 in which the company stated:

"In our letter of December 11, 1939 addressed to Mr. J. V. O'Connor, we call attention in the last paragraph to the possibility that all industrial loads might have to be shut off during a peak winter day. On January 18th and 19th, 1940, that very thing took place. All industrial loads were ordered off at 9:30 a. m. on January 18th and distribution companies asked to take all steps possible to conserve the gas supply. Public Service Company reported the curtailment of industrial loads near Denver, and Cheyenne Light, Fuel & Power Company reported curtailments at Cheyenne.

"Curtailments to our industrial customers lasted about thirty hours and were estimated at 1270 Mcf.

"Public Service Company reported curtailments of 717 Mcf., and Cheyenne Light, Fuel & Power Company reported curtailments totaling 152 Mcf. at Cheyenne. Low pressure experienced on the Cheyenne distribution system was reported to have resulted in several low pressure complaints."

Did you see that letter at or about the time it was received by the Comission which was some months prior to your exhibit, the date of your exhibit and apparently a considerable time before you completed your statement?

A. No, I didn't see it before that time, no.

Q. When did you put these typewritten sheets into your written statement?

A. I put them in sometime in October 1940.

Q. 1940?

A. Yes.

Q. Well, this particular Page 8 I talked about is one of these typewritten sheets, so that in October it was available

at the *offset* of the Commission, the very thing that you say didn't exist so far as your Page 8 and Page 8-A is concerned.

A. I would like to have that letter before me.

Mr. Lange: That refers to 1940.

Mr. McCreery: That's right.

The Witness: I said I was speaking of the statistical part in there of your interruptions at the end of 1939. My statistical part of it doesn't carry anything beyond 1939 and wouldn't have any reference to 1940 because the statistical part wasn't in there.

By Mr. McCreery:

Q. Even though you prepared these sheets in 1940, you weren't dealing with the1940 conditions or any other conditions than you state you had used originally, is that correct?

A. That is correct.

Q. So in the light of subsequent events which aren't present in your study, your statement at Pages 8 and 8-A would have to be considerably revised, would it not?

A. Well, now, it says here the Public Service Company reported the curtailment and the Cheyenne Light, Fuel & Power Company reported a curtailment of gas, but I just don't see about the Colorado-Wyoming curtailment here.

Q. This is a letter written by the Colorado-Wyoming Gas Company, is it not?

A. Yes.

Q. And is not the Public Service Company and the Cheyenne Light, Fuel & Gas Company, two companies, that were the local distribution companies of Colorado-Wyoming Gas?

A. Yes, it states here that there is possibility of industrial loads having to be shut off.

Q. Then read the next.

A. On January 18 the very thing took place. All industrial loads were ordered off on January 18.

Mr. Lange: What year?

The Witness: January 18, 1940.

By Mr. McCreery:

Q. So that in the light of those conditions your state-

ment on Page 8 and 8-A would have to be altered considerably?

A. Not for 1939. That speaks for 1939 and prior to that.

Q. You undertake to state there were no curtailments or shutoffs of industrial service in 1939 to supply peak load demands.

A. There was no record of it taken and the company has so stated it.

Q. Although they didn't state it was done in 1940?

A. In 1940?

Q. No, in 1939.

A. Oh, no. It says the very thing took place on January 18, 1940, not 1939.

Q. Then look at this letter of December 11, 1939. Read that one to see whether it has happened.

A. It says: "Replying to your request of October 19, we present the attached table which shows the major irregularities in our operation. This includes those instances where the cause originated on the Colorado Interstate Gas Company's system.

"I also have in mind several occasions when the domestic peaks were so heavy that industrial plants were asked to reduce their takes during the period of the peak (from one to three hours) after which they were permitted to resume full load operations. No record of such instances has been kept and we are unable to furnish dates and amount of reduction on those occasions.

"We believe we have a very good record for industrial service, having had to shut off our industrial load for a total of only seven days since starting operations. Half of that time occurred between 5/31 and 6/4/37, when the Interstate's line was washed out in several places by the flood in Little Perico Creek in Texas."

Mr. Lange: Read the last paragraph and we will have the whole thing.

The Witness: "In the past the Colorado Interstate Gas Company has been able to furnish us sufficient pressure to maintain excellent winter service to our industrial plants but as to the loads on their lines have been built up, it has been increasingly difficult to maintain high pressure at

Arapahoe. We find that winter storms now tax our system beyond its capacity and at such times industrial load must be reduced. We are told that we can expect no more than 125."

Mr. Lange: It is addressed to Mr. J. V. O'Connor, Federal Power Commission, Central Savings Bank Building, Denver, Colorado?

The Witness: Yes, sir.

Mr. Lange: It is signed by C. J. Shortess, Vice President and General Manager?

The Witness: Yes, sir.

Mr. Lange: And in order that the record may be complete, Mr. McCreery—

Mr. McCreery: Just a minute. I don't want this interruption. You can put that in later. I want to keep on this point here.

Q. When did you first see that letter?

A. I saw that letter at the time it was received.

Q. After you had seen that letter you wrote this Page 8 and 8-A?

A. Yes, sir, I stated there was no record. The company says: "No record of such instances has been kept," and I so state that no record has been kept.

Q. And you said also that there were no interruptions?

A. Yes.

Q. This letter says the opposite.

A. And I think I qualified the "no record of the interruption."

Q. So that is your conclusion?

A. Sure. It says "There was no recorded interruptions."

Q. I note you state on Page 6 that the Colorado Portland Cement Company—this is from your statement—"The Colorado Portland Cement Company is the main line industrial customer of the Colorado-Wyoming Gas Company farthest from the source of supply."

Was it your idea by that statement to imply that as compared with other industrials they paid too low a price?

A. I merely stated the bald fact that was true and they did—

Q. Isn't this also a very bald fact, that the consumption at the Colorado Portland Cement Company was about twice as great as the combined consumption of all of the industrial users put together?

A. It was considerably greater and that is shown in the report.

Q. That is a bald fact?

A. It is shown in the record and I am merely showing it as per Mcf., as I state. I couldn't state it was per Mcf. and then state it was per million feet of gas. I had to state Mcf.

Q. It was significant to state they were further and paid the lowest price but it wasn't significant to indicate the relative volumes?

A. That was shown in the exhibit itself.

Q. But it didn't justify any comment on your part as you have made here?

A. No, I didn't think about it.

Q. You didn't think about it?

A. No.

Q. What do you mean on Page 8 when you state: "The contractual priority of service rights of customers, of course, are dormant so long as there is available an adequate supply to meet the full requirements of all customers and adequate capacity in lines and equipment?"

A. I meant just what I said, that the company doesn't exercise any priority, any contractual priority as long as adequate service is available to everybody. It is dormant during that period of time.

Q. By that you mean the right is still there to be exercised but it isn't necessary, of course, when they have an adequate supply to exercise it, and they wouldn't exercise it?

A. I wasn't speaking of the right but whether the actual exercise was taken at that time.

Q. I thought perhaps that was what you meant. Now turn to Page 6 of your statement, turning to the top of your page in your second column. What do you mean by "Last block of domestic rate and space heating rate cents Mcf."? What do you mean by that?

A. Well, you have the first block of the rate through there at one price and the last block is at another price. I

placed them on a uniform pressure base rather than on a sales base.

Q. What do you mean by that last block?

A. Your break is in two blocks.

Q. I appreciate that.

A. And this refers to the second part of your rate. You have a two-part rate.

Q. Do they include all gas upon which the four cents is applicable, that is, the space heating gas, or do you know?

A. Yes, it is.

Q. It does?

A. It takes in that break afterwards.

Q. Is the average revenue based upon actual revenue received from purchasing company divided by the Mef. converted to the 14.65 pound pressure base?

A. Could I have a copy of my exhibit?

Mr. Lange: Here is a copy of it.

By Mr. McCreery:

Q. I am referring to Page 8, Mr. Lester.

A. The information came from—yes, that refers to the average of the domestic and space heating.

Q. My question was: "Is this the average revenue as you headed it based upon average revenue you received from purchasing companies divided by the Mef. converted to the 14.65 base?"

A. Yes.

Q. Your answer is yes?

A. Yes.

Q. I notice a quotation on Page 4 of your statement, being at about the middle of the page. It states: "To the full extent it may be able to do so." What is your soure of that quotation?

Mr. Lange: On what page is that, Mr. McCreery?

Mr. McCreery: Page 4 of his statement, Mr. Lange.

The Witness: It comes from the contract.

By Mr. McCreery:

Q. Which contract?

A. I will have to look it up.

Q. Well, I guess that is not important.

A. I haven't all of my working sheets here.

Mr. McCreery: It isn't of sufficient importance so I will withdraw the question, Mr. Examiner.

The Trial Examiner: Very well.

Mr. Lange: He can furnish it at some time during the day when he has time to look it up.

Mr. McCreery: Just have it put into the record, Mr. Lange.

Mr. Lange: Very well.

By Mr. McCreery:

Q. What did you determine the load factor of this company to be for the year 1939?

A. I didn't so state what the load factor of the company was.

Q. It doesn't appear in this study?

A. It doesn't appear in this study, no.

Q. The load factor of the entire company was not material in your study?

A. It is not here in this study.

Q. In arriving at the load factor on these industrials you have gone on a yearly basis, 365 days a year?

A. I don't think there was any reference where it was on a yearly basis.

Q. In the case of customers whose meters were read weekly you simply averaged the weekly meter readings?

A. Yes, sir, I did.

Q. Did you ask to see the charts which would have shown that?

A. No, we requested that information. Having requested the information, the company furnished it to us and we asked for it to be on the same period. I don't see any reason why two requests are better than one.

Q. This doesn't have anything to do with what we were talking about a while ago?

A. That is true—

Q. You said the books and the records of the company were made accessible to you, did you?

A. Yes, certainly. The billing of the company was made accessible.

Q. I asked you if you examined their meter charts.

A. No, I didn't.

Q. All right, you have examined meter charts, haven't you?

A. Yes, sir.

Q. So that you would know they have them?

A. Yes, they have them.

Q. You know what those charts would show, don't you?

A. Yes.

Q. And you know you could have gotten the actual peak demands from those charts as indicated by the lines on the charts, do you not?

A. In certain meters that is correct.

Q. You certainly weren't expecting the company to go back and study all of those charts through for you? If you had wanted to know what those charts contained you could have gone there yourself, couldn't you?

A. No, when I was requesting certain information they probably had the information and had it already drawn out along those lines and kept track of the load factor, what their load factor was.

Q. You didn't get these load factors from the company?

A. I certainly got it from the information furnished by the company.

Q. At least these are the load factors you built in your exhibit?

A. Those factors are only a ratio of dividing figures and the underlying facts upon which the ratio was based were furnished by the company.

Q. But the figures you finally concluded were the load factors of your own compilation?

A. I made the division.

Q. On whatever formula you followed?

A. Yes.

Mr. McCreery: I think that is all.

Redirect Examination.

By Mr. Lange:

Q. Referring to the letter received by the Federal Power Commission from the Colorado-Wyoming Gas Company,

dated December 11, 1939, I will ask you to read the letter that was the basis of the letter received on December 11, 1939.

A. "Colorado Springs, Colorado, October, 19, 1939.

"Mr. C. J. Shortess, Vice President and General Manager, Colorado-Wyoming Gas Company, 407 Continental Oil Building, Denver, Colorado.

"Dear Mr. Shortess: Will you please supply a statement of total interruptions of service at each delivery point, giving in each instance:

"1. Customer

"2. Point of Delivery

"3. Date

"4. Duration

"5. Cause

"Please supply also a statement of instances, other than the above, in which it has been necessary to reduce or suspend service to industrial customers, giving in each instance:

"1. Customer

"2. Whether reduction or suspension of service

"3. Date.

"4. Duration

"5. Cause

"Receipt of this information at an early date will be appreciated. Very truly yours, J. V. O'Connor (signed)."

Q. And in connection with the Colorado-Wyoming Gas Company's letter of December 11, 1939, particularly the statement where they say "We present the attached table," that attached table, Mr. Lester, is that the same as Table No. R-5 appearing in Exhibit No. 251, your exhibit?

A. Yes, it is.

Mr. Lange: I believe that is all, Mr. Examiner.

Mr. McCreery: That is all.

The Trial Examiner: You may step down, Mr. Lester.

(Witness excused.)

Mr. Lange: At this time we desire to offer Exhibit No. 251.

Mr. McCreery: I object to the exhibit for several reasons.

First it is immaterial and irrelevant to any issue in this case. It has no relationship to any determination involved in this case. It is obvious that the factual conclusions drawn in proportions of this statement are not in accordance with the facts as they existed and as they must have existed in the mind of this witness when he read certain things that were before him at the time of the compilation;

And so in that respect, referring particularly to the conclusions drawn by him in Pages 8 and 8-A, it is prejudicial because it distorts the actual facts as they existed and as this witness must have known they existed.

Mr. Lange: Mr. Examiner, this exhibit, as the witness stated, purports to cover the period through December 31, 1939 with the exception of changes in either billings—or, rather, changes in contracts or schedules filed by the company with the Federal Power Commission.

In all other respects the witness purports to cover the period down through December 31, 1939.

Mr. McCreery: I am referring now to what the witness had to have on December 11 1939 when he got this chart that has just been talked about, that is, that portion of the letter, and that objection should not be addressed to the letter but in the form of a motion to strike the portion of Page 8 of the statement beginning with the last paragraph on that page and continuing over to the third line on Page 8-A.

The Trial Examiner: As far as your objection to Exhibit 251 is concerned, Mr. McCreery, I note in going through the exhibit there is information contained that might be quite helpful in the disposition of this proceeding, and in any event, the objections stated to the exhibit, if found to be valid and proper, may later be given consideration by the

Examiner, but at this point the Examiner is inclined to admit Exhibit No. 251 in evidence.

(Exhibit 251, Witness Lester, received in evidence.)

The Trial Examiner: Now, as to the written statement—

Mr. Lange: Mr. Examiner, that written statement also refers to the exhibit necessarily as it was read in connection with the Colorado-Wyoming Gas Company's letter to the Commission dated December 11, 1939. It is not only relevant but very definitely necessary to carry through the very statements contained in the company's letter.

Mr. McCreery: I am showing the Examiner the letter in question.

The Trial Examiner: I think in respect to this particular paragraph, Mr. Lange, the record is quite fully developed on these interruptions. As I recall it, there was considerable testimony prior to the testimony of Mr. Lester concerning that.

Mr. Lange: But, Mr. Examiner, the written statement, as well as Mr. Lester's exhibit, doesn't purport to go beyond December 31, 1939 and as of that time that was exactly what information the witness had upon definite requests made to the company. This is what the Commission's letter to the company states. It is very brief. It not only asks for interruptions generally or for cutoffs, but it distinguishes between the two and points out to the company that the Commission desires to have both as to causes as well as to all factors in connection with either a shutdown or a reduction.

The very definite questions were propounded and certainly in the light of that the witness could rely upon nothing better than what the company submitted. That would be the best evidence.

The Trial Examiner: This, however, is a mere conclusion and has nothing to do with the exhibit, the particular paragraph.

Mr. Lange: The exhibit incorporates those interruptions in service in Schedule R-5, Mr. Examiner. It refers very definitely to them. In fact, the letter from the company

was in response to the Commission's letter attached to it containing a list of those reductions or cutoffs and the items upon the basis of R-5 in the schedule.

The Trial Examiner: There is so much testimony in regard to the shutoffs that as far as the Examiner is concerned, the Examiner would prefer to rely upon the record rather than the statement of Mr. Lester's; therefore, the Examiner is going to entertain the motion of Mr. McCreery to strike that paragraph beginning at the bottom of Page 8 of this written statement and concluding on Page 8-A.

(Vol. LXXXVI, pp. 12904-12930.)

CLAUDE R. LESTER, called as a witness by and on behalf of the Federal Power Commission, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Lange:

Q. Please state your name.
A. Claude R. Lester.
Q. Where do you reside, Mr. Lester?
A. I reside at Portland, Oregon.
Q. What is your occupation or profession?
A. I have followed the rate game and regulatory.
Q. Regulatory matters?
A. Yes, regulatory matters. I am a professional engineer in the State of Oregon, registered to practice there as well as a qualified engineer.
Q. By whom are you presently employed?
A. By the Bonneville Power Administration.
Q. How long have you been so employed?
A. Since the middle of May last year.
Q. 1940?
A. 1940.
Q. Were you ever employed by the Federal Power Commission?
A. Yes, I was employed by the Federal Power Commission before going to Bonneville.
Q. How long were you so employed?
A. For over a year.

Q. Have you prepared a written statement setting forth your experience and qualifications?

A. I have.

Q. Please read that into the record.

A. "In 1914 I graduated from the University of Michigan with a Bachelor of Electrical Engineering degree. While at the University I took advance courses in accounting and a course in 'Utility Regulations' given by Dean Cooley, and Professors Riggs and Friday.

"After receiving my degree I entered the employment of the Grand Trunk Railway as an electrician. As an employe of this company I assisted in construction of electrical transmission and distribution lines, installation and maintenance of electrical equipment under the Motive Power Department at the electrically operated shops at Toronto and Montreal, Canada, and Battle Creek, Michigan, and the power plant and transmission line at Port Huron for the Sernia Tunnel. I had charge of the evaluation of all electrical lines and equipment under the Motive Power Department of the Western Division of the Grand Trunk Railway pursuant to orders of the Interstate Commerce Commission.

"In 1917 I enlisted in the U. S. Army, serving with the Fifth U. S. Engineers. In France I had charge of the operation of the electrical light plant for Seventh Division Headquarters and installation of other electric light plants in our Army area.

"In 1919 I entered the employment of the United States Emergency Fleet Corporation in Portland, Oregon, as valuation engineer. The work consisted of the evaluation of surplus shipbuilding material, stores, and equipment.

"In 1919 I was employed as engineer by the Southern Pacific Company, and later by the Oregon-Washington Railway and Navigation Company to assist in bringing up to date the Interstate Commerce Commission's valuation pursuant to I.C.C. Order No. 4.

"In 1920 I was employed by the Public Service Commission of Oregon, the name of which was later changed to Public Utilities Commission of Oregon. During the seventeen years in the State regulatory service I served as assistant engineer, engineer, auditor, principal engineer,

chief engineer, and director of engineers. At first I assisted in the investigation of the books and operations of public utilities, valuations, and rate analyses. As chief engineer and director of engineers I had charge of valuations of public utility property and auditing of the public utilities' books. Also had charge of rate studies and preparation of factual evidence in formal proceedings before the Commission and charge of the studies of other problems confronting the engineering and auditing department of a state public utility regulatory body.

"In 1939 I entered the employment of the Federal Power Commission as associate rate investigator. Besides the rate analysis work in this case, I prepared rate analyses in a number of other natural gas matter for the Commission.

"In May 1940 I entered the employment of the Bonneville Power Administration at Portland, Oregon, as rate analyst. My work with the said Administration, at present, consists of analyses of various types of electric rates used by various private and public utilities and studies of additional use to which electric energy may be devoted.

"I am a registered engineer authorized to practice professional engineering in the State of Oregon, No. 1441."

Q. Mr. Lester, during the time that you were in the employ of the Federal Power Commission, what particular branch of the Commissioned service were you connected with?

A. With the rate department of the Federal Power Commission and in rate work and rate investigation.

Q. While you were employed, did you have any assignment in connection with the preparation of the study of the rates of Colorado-Wyoming Gas Company in this proceeding? Also of related matters to rates?

A. I did.

Q. Did you prepare an exhibit in connection with that study?

A. I did.

Q. I will ask you whether this is the exhibit.

A. That is the exhibit.

Mr. Lange: Will the reporter please identify it?

The Trial Examiner: What is the title of it, Mr. Lange?

Mr. Lange: "Report on the Review and Analysis of the Contracts, Rates and Billings of the Colorado-Wyoming Gas Company.

The Trial Examiner: It will be marked for identification as Exhibit No. 251.

(Vol. LXXXVI, pp. 12877-12881.)

* * * * *

Subsequently the Witness testified as follows:

Q. Mr. Lester, at the noon recess Mr. Dougherty had requested figures that you were to furnish?

A. Yes, sir.

Q. Did you locate your working papers showing those items?

A. Yes, I did.

Q. You might give that information to us at this time.

A. The delivery to the Natural Gas Pipeline Company peak day in 1937 was February 27 and the amount was 68,270. In 1938 it was on November 5, the peak day delivery being 78,005.

Q. Mcf.?

A. Mcf. In 1939 the peak day was November 1 and the delivery was 79,653 Mcf.

Q. And what pressure? Was it on a uniform pressure base?

A. The uniform pressure base.

Q. At 14.65?

A. That is correct.

Mr. Lange: Do you have any further questions regarding this information, Mr. Brock?

Mr. Brock: No questions.

By Mr. Lange:

Q. Mr. Lester, returning to your Exhibits 261 and 262, I will ask you whether or not they contain tables showing interruptions in service, point of delivery, date, customer, duration, and cause?

A. There is a table in there showing that information.

Q. Now, then, these Exhibits 262 and 261 were pre-

pared by you and include matters pertaining to both of these companies down through December 31, 1939?

A. That is correct.

Q. Have you had occasion since the completion of these exhibits to study the history of all interruptions in service of both companies, particularly the information that was set forth in the company's exhibit 290, prepared by Mr. Beardsley?

A. Yes, I have reviewed that exhibit.

Q. Please refer to Exhibit 290 at this time and state what your opinions and conclusions are in connection with the interruptions in service of both companies.

A. There has been no further interruptions of the Canadian River Gas Company.

Q. Of the Canadian River Gas Company?

A. Of the Canadian River Gas Company during 1940.

Q. So those interruptions set forth in your Exhibit 261 are all that you have any knowledge of?

A. That is all I have any knowledge of and I commented upon those interruptions.

Q. All right, let us move to the Colorado Interstate Gas Company.

A. In reviewing the information in Exhibit 290, on Table 2 in that Exhibit is a statement of total interruptions in service to December 31, 1940.

Q. That is Table 2 pertaining to which company?

A. The Colorado Interstate Gas Company—I guess there is a mixup on the table numbers in the exhibit.

Q. Is the table the second to the last one in the exhibit?

A. Yes, the second to the last table in the exhibit.

Q. What statement did you have to make with reference to that table?

A. This is the total interruptions of the company and it shows the hours of duration, also indicates the cause for the total interruptions. The cause of the total interruptions in all cases was due to either pipe failure or washout. Washout, of course, is a cause of pipe failure. It is more or less due to the act of Nature.

The main line industrial total interruptions due to physical causes for the 13 years amounted to 111.5 or 1.7 hours per main line industrial customer.

Q. During the entire history of the company?

A. During the entire history of the company. There are also washouts for the Colorado-Wyoming Gas Company and to the city gate included in there. They amounted to 157.5 hours for the entire service of the company.

Q. In the course of the preparation of these two exhibits you have had all relevant data and records available to you for your inspection?

A. Yes, except the last year.

Q. Except the year 1940?

A. Yes, sir.

Q. Now, then, from your examination of the company's records, particularly those records pertaining to suspensions, interruptions, reduction or interruptions in service, did you find during the entire history of the companies that they lost any customers due to interruptions or suspensions of service?

A. No.

Q. If there had been such a customer loss for any one of those reasons, you would have learned of it in connection with your search of the records?

A. Yes, sir, prior to 1940. I haven't searched the record in 1940.

Q. In so far as 1940 is concerned, does this Exhibit 290, which sets forth reductions and suspensions in service, indicate that any of the customers shown ceased purchasing gas from the company?

A. Not for those causes, no. There is one that has—the Citizens Utilities Company took part of the operation over but they are delivering to all of the city gates and same delivery points during 1940. As to those companies whose interruptions are referred to there, they are still delivering to them.

Q. Borrowing Mr. Keffer's use of the homely illustration about "proof of the pudding is in the eating," would you say that the proof of the pudding with reference to whether these customers of the company are taking these suspensions, reductions, or interruptions in service, as a reason for not purchasing further supplies of gas is not in this picture?

A. No.

Q. In other words, there has been no loss of customers in so far as you know due to any one or all of those factors?

A. That is correct. There has been none. No loss.

Now turning over to the reduction in there, the reduction to the main line industrials amounts to 1.7 hours per year per main line customer.

Q. And you have heard—or, I'll ask you whether you did hear any of the testimony that was given by either one or more of the rate of return witnesses setting forth the fact that these interruptions or reductions in service were risks that the company had to face in its business?

A. I heard some of them testifying to that.

Q. Well, it didn't result in their loss of any customers so far as you know?

A. No, it did not result in the loss of any customers.

(Vol. CI, pp. 15652-15657.)

This is the best this can be photographed because it is very tightly bound.

BAD PRINT

The witness Lester stated exhibits 307 and 308 were compiled from figures taken from the Company books.

---

13. Description of the Facilities of the "Denver Line" Used and Useful in the Transmission of Gas.

By the term "Denver Line" it is intended hereinafter to describe the transmission system employed in transporting *all* gas sold under this project, as it exists, as distinguished from the one assumed transmission line that would be used and useful in transporting only *resale* gas sold under the project which "Resale Line" is next dealt with under Title 14.

The Denver Line begins at the intake side of the Bivins Compressor Station located in the gas field of the Canadian company at a point in Moore County, Texas, approximately thirty-five miles north of Amarillo. It is at this point that the production and gathering functions of Canadian terminate and the transmission line begins. This transmission line for the transportation of *all* gas includes the following described plant or property:

A. All of the properties of the respondent Colorado Interstate Gas Company beginning with the Denver Meter Station located just outside of the city limits and reaching southward, including all laterals, to the junction with the transmission line of Canadian near Clayton, New Mexico.

b. That part of the properties of Canadian located north of the intake of the Bivins Compressor Station and including that station, the gasoline extraction plant, the dehydration plant, a portion of the general property, automobiles, trucks and the Bivins Camp, and all of the main transmission lines and laterals, measuring station and telephone system, all extending northward to the junction with the transmission line of Colorado Interstate at Clayton, New Mexico.

This portion of the transmission system south of Clayton Junction, belonging to Canadian River, is described in detail in its brief, and the investment in such transmission property, as well as the depreciation, amortization, maintenance and other expenses in connection with the opera-

tion thereof, enters into the cost of gas sold and delivered by that company to this respondent at Clayton Junction. Evidence as to all such matters is dealt with at length in Canadian's brief to which reference is made.

The map of this transmission line, Exhibit 36-K is included as Appendix A herein. Other maps are included in Exhibits 5, 13, 36-K, 36-L, 36-M, 36-O, 36-P, 44, 45, 46, 48, 60, 70, 138, 281, 282. The Commission's witness O'Connor gave a good general description of Canadian's portion of this transmission system in his Exhibit 47 and of this respondent's portion in Exhibit 49. Also in his Exhibit 138-A, he made a written statement concerning his flow map, Exhibit 138. From those exhibits as well as Exxhibits 65, 66, 68, 70, 281 and 282, offered for the companies, and additional Exhibits 139 and 146 submitted for the Commission, we can make the following descriptions of the main items of the transportation system belonging to this respondent from Clayton Junction, New Mexico, north to the Denver Meter Station just outside the City of Denver:

Clayton Junction is approximately seven miles northeast of the town of Clayton, New Mexico. At that point respondent owns a compressor station located approximately 400 feet north of the junction of this transmission line with Canadian. The equipment consists of three 1,000 h.p. Worthington Gas Engine Driven Compressors and appurtenant and auxiliary equipment and necessary housing. (Exhibit 65). The witness O'Connor for the Commission was in error in describing this equipment as consisting of only *two* such 1,000 h.p. units. (Exhibit 49, p. 3). On cross examination he corrected this:

> "Q. Where you say that equipment at Clayton Compressing Station consists of two 1,000 h.p. Worthington Gas Engine Driven Compressors, my understanding is that there are three units. Is that correct?
>
> "A. That is correct. * * * There are three compressors." (Vol. VII, p. 924).

From Clayton Junction in a general northwesterly direction the main transmission line extends approximately seventy-eight miles to the Canyon Compressor Station (O'Connor's Exhibit 49, p. 2). This line, as well as the remainder

of the main transmission line northward to the Devine Compressor Station, is a 22 inch outside diameter lap-welded steel "Dresser-coupled line * * *, and built with single random length pipe averaging 19 feet per joint." (Lee M. Hill's Exhibit 231, p. 2; O'Connor's Exhibit 49, p. 3).

The Canyon Compressor Station is located approximately forty-five miles southeast of Trinidad, Colorado and the equipment consists of "three 1,000 h.p. Worthington Gas Engine Driven Gas Compressors and appurtenant and auxiliary equipment" and necessary housing. (Exhibit 49, p. 3). The line then extends approximately seventy-one miles north to the Devine Compressor Station located eight miles east of Pueblo, Colorado. On this section of the line there are located two maintenance camps—the first, Delhi Maintenance Camp lying about midway between the crossings of the Purgatoire and Apishapa Rivers; the second, the Apishapa Maintenance Camp, lying just north of the crossing with the Apishapa River.

Just north of the Arkansas River there is located the Devine Compressor Station. There the equipment also consists of "two 1,000 h.p. Worthington Gas Engine Driven Gas Compressors and appurtenant and auxiliary equipment" and necessary housing. (Exhibit 49, p. 3).

From the Devine Compressor Station northward to Denver, the main line is of the same type, except that it is reduced in outside diameter from 22 to 20 inches, and extends approximately one hundred and five miles north to the Denver Meter Station at the Denver Gate. (Exhibit 49, p 2). O'Connor, in his Exhibit 49, p. 3, makes the following description of the lateral lines:

> "The lateral lines consist of welded or Dresser coupled steel pipe of various nominal diameters, from 2 inches to 8 inches."

On cross examination; he corrected this statement to read: "* * * from 2 inches to 16 inches". (Vol. XXXIV, p. 4701). Continuing, he states:

> "The principal lateral lines are as follows:"

Lateral Line	Approx. Length (Miles)	Diameter of Pipe (Inches)
American Crystal Sugar Company	2	4
American Crystal Sugar Co. Loop	2	6
Arkansas Valley Lines	32	2, 3, & 4
Aurora-Fitzsimons	8	2, 6, & 8
Colorado Fuel & Iron Corp., Pueblo	12	16
Colorado Springs	6	8
Fountain Valley School	2	2
La Junta	35	6 & 8
Las Animas-Fort Lyon	25	6 & 8
North	7	10
Portland	28	8
Rocky Ford	4	8"

(Exhibit 49, p. 3).

O'Connor stated in this same Exhibit 49, p. 3:

> "The company maintains operators' villages and camps at each compressing station, and at a number of points along the transmission line.
>
> "The company operates its own telephone system from Clayton Junction to Denver, which is located generally on pipe-line right of way.
>
> "The company owns measuring stations at each gas delivery point for the determination of the volume of gas sold."

The Company's witness Rhodes confirmed the foregoing description of the Denver Line with his Exhibit 65 entitled "Statistics as to Physical Property of the Denver Pipe Line 1929 to 1939 inclusive". This witness, as vice president of FB&D, designed the line, participated in its construction and to some extent was concerned with its operation under the management contract of FB&D. On page 3 of his Exhibit 65, he gave a detailed description of the principal river crossings of the pipe line. These crossings were made with multiple or loop lines for safety or insurance in flood times. They are as follows:

"Description

Principal River Crossings (C. I. G. Co.)	Size o.d. (in.)	Weight Per Foot (lb.)	Size or Length
Huerfano River (7 line)	10¾	54.00	9,058 ft.
Arkansas River (6 line)	10¾	54.00	15,224 ft.
Jimmy Camp Creek (3 line)	10¾	43.68	2,727 ft.
St. Charles River (2 line)	10¾	54.00	3,001 ft.
Huerfano Loop	10¾	33.48	1,446 ft.
Apishapa Loop	12¾	41.51	16,507 ft.
Sand Creek Loop	10¾	31.20	13,178 ft."

There was no conflict in the exhibits or testimony offered by the engineers or other persons experienced in the operation of the gas system on behalf of the respondent company, and those offered by the engineers of the Commission as to the "used or useful character" of any item of property in the Denver Line.

* * * * *

Since Mr. George I. Rhodes, for the company, and Messrs. Lee M. Hill and J. V. O'Connor, for the Commission, all testified as engineers under this title and testified on other technical subjects hereinafter, there will be included herein an abstract of the evidence pertaining to the qualifications of each.

Evidence of the fact that Mr. Rhodes is vice-president and director of FB&D, and that in addition he was chief engineer of that firm at the time FB&D designed and constructed the properties of this project, has already been abstracted hereinabove. That abstract shows that he personally checked the design (Exhibit 98, p. 1; Vol. XXII, p. 3150) for this project, and was on the ground participating in the supervision of the construction. It also shows that during the time FB&D operated the property under the management contract, Mr. Rhodes participated in the management and was generally familiar with the problems of the project.

Before going with FB&D, he graduated from Massachusetts Institute of Technology in 1905, with a degree of Bachelor of Science (Vol. VIII, p. 1101). He was then an instructor at his Alma Mater for a year. From 1906 to

1911, he was with the Motive Power Department of Interborough Rapid Transit Company, New York. From 1911 to 1917, he was consulting engineer of White Weld & Company, investment bankers, reporting on properties financed or about to be financed, all with respect to which that investment banking firm had any interest or connection (Vol. VIII, p. 1105). He then stated, for the record, some of the more important of 2,500 clients of FB&D; or its subsidiary, FB&D Construction Corporation, including the United States Government, many of the states of the Union and practically all the largest industrial and utility corporations in America, for which his firm had made studies, designed properties and constructed properties (Vol. VIII, pp. 1103, 1104).

Since 1923, he has been largely occupied with work in the natural gas field. He first estimated the gas reserves of the Monroe, Louisiana, Field. This led to the construction by FB&D of the natural gas burning power station of Louisiana Power & Light Company, which consumes more than 30,000,000 cubic feet per day. He and Edgar G. Hill, of FB&D have shared responsibility and have worked together on all natural gas projects in which FB&D were employed. On the Edmonton, Alberta, Canada, job, Mr. Hill had charge of the construction and he had charge of checking designs and specifications. On the Louisiana pipe line system, Hill also had charge of construction, and he was responsible for compressor stations. On the Denver project, Hill also had charge of construction, but he made preliminary reconnaissance and reports and, as already stated, checked the design. FB&D constructed, as general contractors, the line from Monroe, Louisiana, to Memphis and Jackson, Tennessee. Mr. Hill gave that job his prime attention, but the witness, as chief engineer of FB&D, also did work in connection therewith. Hill had charge of the construction of the line from Monroe, Louisiana, to Eldorado, Arkansas, on which the witness was employed only as an executive of FB&D. FB&D, as general contractors, constructed the line from Monroe to St. Louis, on which the witness made preliminary reconnaissance and reports, and was likewise responsible for the construction. The men in the field reported directly to him. On Southern Natural Gas Company's line from Monroe to Atlanta

Georgia, he made preliminary reconnaissance, and was responsible for the design as well as the supervision of the construction. In fact, he had charge of the whole work and made his headquarters in the field at Birmingham. In addition, he had charge of the financing of that construction, except the corporate relations with public authorities and the bankers. On the line of the Natural Gas Pipe Line Company of America from the Texas Panhandle Field to Chicago, he made the preliminary reconnaissance and reports as to location, costs and markets for one member of the group that finally joined in the financing of that project. He was also responsible for the construction of the Kansas section of the Chicago Line, and Mr. Hill had charge of the construction of the Illinois section of the same line. He had charge of the preliminary reconnaissance and design, and actual charge and supervision of the construction of El Paso Natural Gas Company's extension to Douglas, Arizona, and Cananea, Mexico, and of the enlargement of the capacity of the line from West Texas to El Paso and the Southeast New Mexico gas fields. He made designs and estimated costs of the natural gas system to serve territories served by Cities Service Gas Company. He had the final responsibility for the design and satisfactory construction of the gasoline pipe line from Amarillo, Texas, to East St. Louis, built by Phillips Pipeline Company. He was associated with Mr. Hill, who had the prime responsibility in the construction of the oil pipe line from the East Texas oil field to Shreveport. Also with Mr. Hill he was associated in the construction of a liquid propane pipe line from Charleston, West Virginia, into Kentucky, a gasoline pipe line from Toledo, Ohio to Detroit, Michigan, a gasoline pipe line from Reading, Pennsylvania, to Philadelphia, and also several hundred miscellaneous oil and gas lines scattered throughout the country. These properties were constructed under the direction of FB&D and cost more than $125,000,000. About half of them were operated by FB&D for varying periods of years (Vol. VIII, pp. 1106-1109, inclusive). Since the fall of 1935 he has been engaged principally in valuations, cost determinations and analyses of operations of natural gas properties. He has given particular attention to prevention of corrosion on pipe lines. In addition to his work in the design, construction and

eration, for a time, of the Denver Line, he has recently made a study and examination of its properties in order to testify in this case, and, for that purpose, recently spent several weeks in the field and in the offices of the respondent Colorado and Canadian Companies (Vol. VIII, pp. 1109-1111, inclusive).

Mr. James V. O'Connor has been employed as a gas engineer by the Federal Power Commission since September, 1934. He graduated from Massachusetts Institute of Technology in 1923, with a B.S. in Mechanical Engineering. He attended night sessions of the Graduate School of Business Administration, N. Y. U. from 1927 to 1928. From 1923 to 1928, he was employed by the Brooklyn Edison Company, testing steam power plant equipment, developing improved operating methods, inventorying properties, making forecasts of power sales, output and demands, and miscellaneous tests, investigations, studies and reports on operating problems. From 1929 to 1934, he was employed by the American Gas Association in the collection, compilation and analysis of reports filed by member companies, and in the preparation of reports on production, transportation, distribution and sale of gas, and the preparation of data for the use of the Association's committees, and of data for use with Government agencies, gas utilities and others. Up until 1938, his work was primarily with electric utilities, but since that time it has been concerned with natural gas companies (Vol. VI, pp. 793, 794). All of his work with the American Association was in the office and none in the field (Vol. VII, pp. 874, 875). Until the passage of the Natural Gas Act, his work with the Commission was almost exclusively concerned with electrical companies. After the passage of that Act, his first assignment was to investigate the complaint of a coal dealer concerning discrimination in wholesale natural gas rates to serve an industrial business, lodged against a distributing company taking gas off the Denver Pipe Line (Vol. VII, pp. 875-878). He was then assigned to an investigation of the respondent companies and started work on March 15, 1939, in the office of the Canadian and Colorado Companies at Colorado Springs, and he never did any work on any other natural gas company (Vol. VII, p. 876).

[Testimony of LEE M. HILL.]

Q. State your name, please?

A. Lee M. Hill.

Q. Where do you reside, Mr. Hill?

A. Denver, Colorado.

Q. Where and by whom are you presently employed?

A. The Federal Power Commission.

Q. At the regional office in Denver?

A. Yes.

Q. And what is the nature of your occupation?

A. Associate Engineer.

Q. And how long have you been so employed by the Commission?

A. Since April 10th, 1939.

Q. April 10th, 1939?

A. Yes.

Q. Did you during the time of your employment with the Commission have any assignment in connection with the present—any portion of the present proceedings?

A. Yes, sir.

Q. That is, engineering work in connection with it, particularly the Canadian River Gas Company and the Colorado Interstate Gas Company?

A. Yes, sir.

Q. Now, before going to that, though, I will ask you whether you have before you and can read in the record your qualifications in connection with the work that you are doing with the Federal Power Commission?

A. Yes, sir.

Q. Will you do that now, Mr. Hill?

A. "My name is Lee M. Hill. I reside at Denver, Colorado. I am an engineer by profession. I have been employed by the Federal Power Commission at Denver, Colorado, since April 1939. I have performed engineering duties for the Commission and am now engaged in such duties in the capacity of associate engineer.

"I entered the Alabama Polytechnic Institute in September 1921 and there studied mechanical engineering for three and one-half years. I have passed the required state examination for engineers and am licensed to practice professional engineering in the State of Alabama.

I was employed by W. E. Brown Engineering Company at Miami Beach, Florida as a draftsman and instrument man. My experience with this company was mostly in design and layout of water drainage and distribution systems and sanitary sewers.

"In 1925 I went to Birmingham, Alabama as a draftsman for the Sloss-Sheffield Steel and Iron Company and remained in that capacity until the early part of 1927 when I was made construction engineer. My engineering experience with this company consisted of design, construction and general maintenance of blast furnaces, by-product plants, steam power plants, power transmission systems, water transmission and distribution systems, water filtration plants, coal and ore washers, mine tipples and electrification of mine properties.

"In February 1929 I was employed by the Southern Natural Gas Corporation and later by the Southern Natural Gas Company as a mechanical draftsman and worked on plans of their natural gas pipe line system, extending from the Monroe, Louisiana gas fields across the states of Louisiana, Mississippi, Alabama and into the state of Georgia.

"In 1930 I was made chief draftsman in charge of plans for a number of major pipe line extensions, compressing stations, measuring and regulating stations, and medium and low pressure distribution systems. In the early part of 1931 I was transferred to the operating department and there designed pipe line and compressor station extensions, measuring and regulating stations, industrial installations, distribution systems, and all other engineering work pertaining to maintenance and operation of natural gas transmission and distribution systems.

"In 1938 I was made construction engineer and designed and constructed two additional compressing stations. I left the employment of the Southern Natural Gas Company in April 1939 and since that time have been employed by the Federal Power Commission at Denver, Colorado."

Q. Mr. Hill, I will ask you whether or not in connection with your work with the Commission you have prepared an exhibit covering the determination of composite

service lives of physical properties of Canadian River—of Colorado Interstate Gas Company?

A. Yes, sir, I did.

Q. Is this the exhibit that I show you?

A. Yes, sir.

Mr. Lange: Will the stenographer please identify that?

The Trial Examiner: It will be marked for identification as Exhibit No. 177.

(Exhibit 177, Witness Hill, marked for identification.)

By Mr. Lange:

Q. Mr. Hill, during what period of time since you have been employed with the Federal Power Commission have you worked on this assignment?

A. Ever since I have been with them.

Q. And that was what month and year?

A. April 1939.

Q. April 1939?

A. Yes.

Q. In connection with this work did you actually go over the property?

A. Yes, sir, I did.

Q. And personally saw the items of property that you would describe in those portions of the pipe that are underground and that you inspected at certain points along the line?

A. Well, some of the inspections I made, not all of them.

Q. Not all of them?

A. No. I did inspect all the property.

Q. You inspected the compressor stations, too?

A. Yes, sir.

Q. Now, did you in connection with this exhibit prepare—or, rather, turning to Page 1 of this exhibit, will you read that statement which was prepared by you?

(Vol. L, pp. 6957-6961.)

EXHIBIT NO. 138-A.

Written Statement of James V. O'Connor.
Flow Diagram.

Canadian River Gas Company, Colorado Interstate Gas Company, and Colorado-Wyoming Gas Company.

Exhibit No. 138 is a graphical map, prepared under my supervision, entitled "Flow Diagram of the Pipe Line Systems of Canadian River Gas Company, Colorado Interstate Gas Company, and Colorado-Wyoming Gas Company for the Year 1939."

The basic data used in preparing the exhibit were obtained from maps and information supplied by the companies, and from information collected by the Commission's engineering and accounting staff from the records of the companies.

The diagram shows, in graphic form, the volumes of gas transmitted by the companies listed on the diagram, the volumes delivered and sold at each delivery point, and the volumes used by the companies or lost in operations, for the year 1939. The diagram, in effect, shows the disposition of the total volume of gas produced by Canadian River Gas Company in the Texas Panhandle Field in 1939.

All figures on the diagram are gas volumes in MCF at 14.65 pounds per square inch absolute. Company records of gas volumes, at various pressure bases, were converted to 14.65 pounds per square inch absolute by multiplying volumes shown on company records by the ratio of the absolute pressure bases on which the volumes were recorded to 14.65. Volumes recorded by the companies have not been corrected for any other factors.

The approximate geographical locations of all gas deliveries are shown on the map. The volume of gas transmitted through the pipe lines is graphically illustrated by the width of the flow lines. In general, their width is directly proportional to the total volume of gas which flowed past any given point during 1939. The volume of gas sold to each direct customer, pipe-line company, and distribution system in 1939 is shown.

In the lower right-hand corner, there is a rectangle which indicates the total well production of Canadian River Gas Company in 1939, amounting to 46,783,394 MCF. The diagram shows that this well production is delivered as follows:

To the Denver Line, 21,059,780 MCF, or 45.0%.

To the Chicago Line, 20,191,512 MCF, or 43.2%.

To Amarillo Oil Company in the field for resale at Channing, and at Amarillo and vicinity, 4,809,758 MCF, or 10.3%.

Company use in the field and free gas to lessors, 722,344 MCF, or 1.5%.

The wide black line extending south indicates the total volume of gas sold by Canadian River Gas Company to Amarillo Oil Company for resale at Amarillo and vicinity under Contracts "B" and "C" (Exhibits 16-B and 16-C in this proceeding). The diagram also shows the disposition of this gas, including the amount ultimately delivered by Panhandle Pipe Line Company to Amarillo Gas Company for resale to consumers in Amarillo, Fritch, and Exell; the volume sold to West Texas Gas Company near Amarillo by Amarillo Oil Company; and the volume delivered to the smelter of the United States Zinc Company at Amarillo by Amarillo Oil Company. This section of the diagram also shows the volume of residue gas which Amarillo Oil Company purchased from the helium plant operated by the United States Bureau of Mines near Amarillo, and resold to the United States Zinc Company.

The wide line extending in a northeasterly direction indicates the volume of gas which Canadian River Gas Company transmitted through the facilities of Texoma Natural Gas Company to Gray Junction, Oklahoma, and sold to Colorado Interstate Gas Company at that point. At the same location, Colorado Interstate Gas Company sold the gas to Natural Gas Pipeline Company of America for resale to direct customers and to distribution companies in Kansas, Nebraska, Iowa and Illinois. Colorado Interstate Gas Company supplies approximately 25 percent, and Texoma Natural Gas Company supplies approximately 75 percent of the total natural gas requirements of Natural Gas

Pipeline Company of America. The diagram shows only the portion supplied by Colorado Interstate Gas Company. If the entire volume transmitted through the facilities of Texoma Natural Gas Company to Gray Junction, Oklahoma to supply Natural Gas Pipeline Company of America were shown, the flow line would be approximately four times as wide.

The line extending in a general northwesterly direction shows the volume of gas handled on the transmission systems owned and operated by Canadian River Gas Company, Colorado Interstate Gas Company, and Colorado-Wyoming Gas Company. Along this interconnected pipeline system, volumes are delivered and sold at various points, and the width of the flow line decreases correspondingly. Slight reductions in the width of the flow line occur at Hartley, Dalhart, and Texline where Canadian River Gas Company sells gas to Amarillo Oil Company for resale to Dalhart Gas Company, and at Clayton, New Mexico where Canadian River Gas Company sells gas to Clayton Gas Company. A more substantial reduction in the width of the main flow line occurs at the point where the La Junta Lateral of Colorado Interstate Gas Company takes off to serve direct customers and distribution systems in the Arkansas Valley in Colorado. A sharp reduction in the width of the flow line occurs at Pueblo due to the large deliveries to Colorado Fuel and Iron Corrporation, and another considerable decrease in the width of the flow line occurs where gas is taken off for delivery to Colorado Portland Cement Company at Portland, Colorado. The flow line is further reduced as deliveries are made to the City of Colorado Springs. A sharp reduction in the width of the flow line occurs at Denver, where deliveries are made to Public Service Company of Colorado. The flow line extending from Denver north, with numerous branches, indicates gas handled and sold by Colorado-Wyoming Gas Company. The flow line for this company decreases in size as deliveries are made to various customers, and terminates as a narrow line at Fort Warren, Wyoming. Fairly substantial reductions in the width of the flow line for Colorado-Wyoming Gas Company occur at the point where the gas is taken off for delivery to Colorado Portland Cement Company at La Porte, and at the Greeley-Johnstown-Great

Western Sugar Company lateral from which gas is delivered to Great Western Sugar Company and also to the distribution systems at Greeley and Johnstown, Colorado.

This diagram serves to graphically portray the relative volumes of natural gas delivered at various points and to various consumers along the pipe-line systems. For instance, the diagram shows that the largest delivery, 20,367,632 MCF, was made at Gray Junction, Oklahoma to Natural Gas Pipeline Company of America; the second largest delivery, 7,257,379 MCF, was made to Colorado Fuel and Iron Corporation at Pueblo, and the third largest delivery, 6,196,882 MCF, was made to Public Service Company of Colorado for resale in Denver.

The diagram also facilitates comparison of the volumes of gas delivered at the several points. For instance, among the many comparisons that can be made, the following are cited here:

(1) Deliveries to the Chicago Line are very nearly equal to deliveries to the Denver Line.

(2) Sales to Colorado Fuel and Iron Corporation at Pueblo are greater than deliveries at any other point on the Denver Line. Sales to Colorado Fuel and Iron Corporation were 1,060,497 MCF, or 17 percent greater than sales to Public Service Company of Colorado at Denver, the second largest delivery on the Denver Line.

(3) Sales by Colorado Interstate Gas Company to Colorado Portland Cement Company at Portland, Colorado, the second largest direct customer on the Denver Line, were 1,676,091 MCF, which is 220,537 MCF greater than the total volume of gas (1,455,554 MCF) sold by Colorado Interstate Gas Company to all distribution systems, except Public Service Company of Colorado.

(4) Sales by Colorado Interstate Gas Company to Colorado Fuel and Iron Corporation and Colorado Portland Cement Company, its two largest direct customers, were 8,933,470 MCF, which is approximately 10 percent more than Colorado Interstate's sales of 8,106,507 MCF to all distribution companies, including Public Service Company of Colorado.

(5) Colorado Interstate's total sales in the Arkansas Valley were 1,153,249 MCF. Of this total, 972,232 MCF, or 85 percent was sold to three direct customers, and the remaining 15 percent, or 181,017 MCF, was delivered to eight distribution systems. Deliveries to each of the three direct customers were greater than total deliveries to all eight distribution systems.

(6) Sales by Colorado Interstate Gas Company to the distribution system at Pueblo, a city of approximately 50,000 population served by a 16-inch pipe line, were 452,992 MCF, or only 9 percent more than sales by Colorado-Wyoming Gas Company to the distribution system at Cheyenne, Wyoming, a city of approximately 20,000 population served by a 6-inch pipe line.

(7) The largest single delivery by Colorado-Wyoming Gas Company is made from the company's Cement Branch line to the Colorado Portland Cement Company at La Porte. This sale was 864,390 MCF in 1939, and was greater than the sum of the deliveries to the two largest distribution systems served, Fort Collins and Cheyenne. Deliveries to the two cities totaled 751,068 MCF.

(8) Colorado-Wyoming's second largest outlet was the Greeley-Johnstown-Great Western Sugar Company branch line. Total sales from this line in 1939 were 467,691 MCF, of which 312,548 MCF or 67 percent was sold to Great Western Sugar Company, a direct customer, and 155,143 MCF or 33 percent was sold to the distribution systems at Greeley and Johnstown, Colorado.

The diagram also shows state lines and the approximate volumes of gas which crossed various state lines through facilities owned or leased by Canadian River Gas Company, Colorado Interstate Gas Company, and Colorado-Wyoming Gas Company. No gas measurements are made at state lines by any of the companies. The volume of gas shown as having crossed the Colorado-Wyoming state line is the sum of deliveries to Cheyenne and Fort Warren, or 430,362 MCF. The volume shown on the diagram as crossing the New Mexico-Colorado state line, 21,038,665 MCF, is the summation of the volumes of gas recorded as sold and used by Colorado Interstate Gas Company north of

that boundary. The volume of gas shown as crossing the Texas-New Mexico state line is the sum of the preceding figure, 21,038,665 MCF, the volume used at Clayton Compressing Station, 68,431 MCF, and the volume sold to Clayton Gas Company, 104,710 MCF, or a total of 21,211,806 MCF. The volume of gas shown on the diagram as crossing the Texas-Oklahoma state line, 20,367,632 MCF, is the amount sold by Colorado Interstate Gas Company to Natural Gas Pipeline Company of America, at Gray Junction, Oklahoma.

14. Description of the Facilities of an Assumed Denver Line Used and Useful in the Transmission of Resale Gas Only.

The witness Rhodes, as the evidence already abstracted shows, took part in the design and personally checked the design of the Denver Line as built. In his Exhibit 98 and his testimony from the stand he described the facilities of a line that would be required to transport *resale* gas only.

The transmission line, as built, was for both direct sale gas and resale gas. It is of 22-inch diameter from the Bivins Station to the Arkansas River in Colorado, and from there on into Denver it is of 20-inch outside diameter. Practically all of the direct sale gas leaves the line in the valley of the Arkansas River (Vol. XXII, p. 3150; O'Connor's Exhibits 138 and 138-A). Colorado Interstate has only two direct sale customers north of the junction of the 22-inch and the 20-inch lines. They are, first, the Colorado Portland Cement Company and, second, the City of Colorado Springs power plant (Rhodes, Vol. XXII, p. 3166). Colorado Interstate's contract with the Colorado Portland Cement Company under which respondent is only obligated to sell gas "from March to October, inclusive, and for longer periods each year by mutual agreement, if seller has gas and capacity available." (Rhodes, Vol. XXII, p. 3166; Exhibit 9.) On peak loads the supply to Colorado Portland Cement Company has been cut off completely (Rhodes, Vol. XXII, p. 3167; Exhibit 290, Beardsley, Vol. VII, p. 942-954; Vol. XCVIII, pp. 15202-15213). After reciting the foregoing facts, Rhodes stated:

> "It is obvious that the extra two inches in diameter south of the Arkansas River was installed primarily for

the purpose of handling this direct sale gas. The principles which governer the design of the present line thus require an all 20-inch Denver line for resale gas alone. These same principles require the 20-inch pipe for such an all 20-inch Denver line to be of the same weight as the 20-inch pipe in the present line north of the Arkansas River.

* * * *

"I might point out that in place of 86.60 pounds per foot for 20-inch pipe, we reduced it to 72.16 pounds per foot for 20-inch pipe which is the weight of the heavy 20-inch pipe north of the Arkansas; and in place of the 79.50 pounds per foot for 22-inch pipe, namely, the light pipe, we used 65.70 pounds, which is the same as the 20-inch pipe."

A line for resale gas alone would not only permit smaller, that is, 20-inch, outside diameter main line throughout its length and of lighter weight, but would also permit the elimination of the following laterals which are used solely in the delivery of direct sale gas:

"Table B

Laterals Not Needed for Resale Gas Alone.

	Length Feet	O. D. Inches	Lb. Per Foot
Colorado Fuel & Iron Branch	1,290	16	52.35
Portland Lateral	145,875	8⅝	18.25
Portland Lateral	2,205	8⅝	33.04
Fort Lyons Extension	25,255	6⅝	12.89
Fort Lyons Extension	2,000	6⅝	25.65
Santa Fe Shops Branch	7,277 (A)	4½	8.63
Harvey House Branch	2,787 (A)	2⅜	3.65
American Crystal Sugar Branch	9,634	6⅝	12.89
American Crystal Sugar Branch	1,105	4½	8.63

Note: (A) All but 2,066 ft. of 4½ in. disposed of in 1939."
(Exhibit 98, p. 3; Rhodes, Vol. XXII, p. 3151)

Likewise, the following laterals now used for both kinds of gas could be reduced in size when employed for resale gas alone:

"Laterals Reduced in Size for Resale Gas Alone.

	Length Feet	As Built O. D. Inches	As Built Lb. Per Foot	For Resale Gas O.D. Inches	For Resale Gas Lb. Per Foot
Pueblo Lateral	60,636	16	52.35	8⅝	18.25
La Junta Trunk	160,001	8⅝	18.25	6⅝	12.89
La Junta Trunk	269	10¾	54.00	8⅝	27.74
La Junta Extension	22,189	6⅝	12.89	6⅝	12.89
La Junta Extension	100	6¾	19.45	6⅝	19.45
Rocky Ford Branch	22,336	8⅝	18.25	6⅝	12.89
Las Animal Extension	2,052	8⅝	18.25	4½	8.63
Las Animal Extension	105,310	6⅝	12.89	4½	8.63
Las Animal Extension	595	6⅝	21.06	4½	8.63
Las Animal Extension	129	4½	8.63	4½	8.63"

(Exhibit 98, p. 4; Rhodes. Vol. XXII, pp. 3152, 3153)

Likewise, the following river crossing facilities could be reduced:

"River Crossing Reduced in Size for Resale Gas Alone

	Length Feet	As Built O. D. Inches	As Built Lb. Per Foot	For Resale Gas O. D. Inches	For Resale Gas Lb. Per Foot
Huerfano River	7 at 1,294	10¾	54.00	.....	.....
Huerfano River	6 at 1,294	.....	.....	10¾	54.00
St. Charles River	2 at 1,500	10¾	54.00	6⅝	25.65"

(Exhibit 98, p. 5; Rhodes, Vol. XXII, p. 3163).

A line built for resale gas alone would not require the following meter stations now used exclusively in measuring direct sale gas: One at Thatcher for the helium plant, U. S. Government; one at Fort Lyons Hospital, U. S. Government; one at American Crystal Sugar Company plant; one at La Junta for the Santa Fe Railroad shops, and one for the Harvey House; one at Colorado Portland Cement; and one main and four branch meters, C. F. & I. plant, Pueblo.

Since at times of peak demand the resale gas employs all of the compressor stations, no such compressor station could be eliminated on a line for resale gas alone. Rhodes stated:

"A 20 inch Denver line for resale gas alone developed under the same principles of design as the 22 inch line

actually built calls for compressor stations in the same locations and initially of the same size as those actually built." (Exhibit 98, p. 6; Vol. XXII, p. 3154.)

Additional facilities for such a "*resale line*" that would be made necessary by estimated future peak loads of resale gas are set forth hereinafter under Title 17, "Peak Load Obligations and Line Capacity of an Assumed Denver Line for Resale Gas Only, as Found Through the Winter 1939-1940, and as Estimated Through 1947, and Estimated Necessary Additional Facilities."

Further Testimony of WITNESS RHODES, on Cross-examination:

Q. Mr. Rhodes, what is the purpose of this exhibit?

A. It shows a description of what would have been built had we been considering only the gas sold for resale.

Q. As I understand it, your firm, Ford, Bacon & Davis, Inc., in 1928, in designing this line designed it for this dual load, both the domestic and industrial consumers, and the retail consumers?

A. That is correct.

Q. At that time did you make any study as to the possibility of constructing a line and the cost of constructing a line just to serve the resale customers?

A. No. At that time we did not make such a study.

(Vol. XXII, pp. 3163-3164.)

* * * * *

Rhodes testified further with reference to the scope of Exhibit 98:

A: "1. Scope of This Exhibit.

"The Denver line was planned, constructed and developed to take care of the markets both for gas to be sold for resale and for gas to be sold directly to the consumer. The line was designed by the Ford, Bacon & Davis, Inc. organization with final check and approval by me as Chief Engineer. The markets for gas sold for resale alone require a line of smaller capacity. This exhibit describes such a Denver pipe line system designed to supply this restricted market but otherwise following the same principles that govern the design and development of the pres-

ent pipe line system. This description is confined to those parts of such a system which differ from the system as actually developed.

"2. Pipe Size in the Main Trunk Line for Resale Gas Alone.

"The trunk line of the present system is of 22-inch pipe from the field to the Arkansas River and 20-inch pipe from the Arkansas River to Denver. Practically all of the direct sale gas is taken off from the main line in the Arkansas River Valley and all but a small fraction of the resale gas is handled through the 20-inch line north of the river.

"It is obvious that the extra two inches in diameter south of the Arkansas River was installed primarily for the purpose of handling this direct sale gas. The principles which governed the design of the present line thus require an all 20-inch Denver line for resale gas alone. These same principles require the 20-inch pipe for such an all 20-inch Denver line to be of the same weight as the 20-inch pipe in the present line north of the Arkansas River. The length and weight of pipe in such a Denver line in comparison with the length and weight of the corresponding pipe used in the present line are shown by Table A."

Q. Mr. Rhodes, if I may interrupt you here, please.

Mr. Dougherty: Will it be sufficient to let this table A go or have it copied in? Which is desired?

The Trial Examiner: I think as long as the table is contained in the exhibit, Mr. Dougherty, that will be sufficient. I don't think there is any necessity for him reading the tables.

By Mr. Dougherty:

Q. You may skip the tables, that table, at any rate, Mr. Rhodes.

A. I might point out that in place of 86.60 pounds per foot for 20-inch pipe, we reduced it to 72.16 pounds per foot for 20-inch pipe which is the weight of the heavy 20-inch pipe north of the Arkansas; and in place of the 79.50

pounds per foot for 22-inch pipe, namely, the light pipe, we used 65.70 pounds, which is the same as the 20-inch pipe.

"3. Pipe Size in Laterals for Resale Gas Alone"—

I will call attention to an error in the heading of Section 3 which I have just noticed. It should read: "Laterals not needed for resale gas alone."

The Trial Examiner: You would strike, Mr. Rhodes, the first three words?

The Witness: I would eliminate "Pipe Size in Laterals" and substitute for that "Laterals Not Needed."

The Trial Examiner: Very well.

Mr. Reporter, please make that physical correction in the record.

The Witness: May we go off the record?

The Trial Examiner: Yes.

(Discussion outside the record.)

The Trial Examiner: On the record.

Mr. Rhodes, will you make that statement now for the record?

The Witness: The subject of the third section should be: "Laterals Not Needed and Pipe Size in Laterals for Resale Gas Alone.

"A system built solely for resale gas has no need for the following laterals that are used solely in the delivery of direct sale gas."

Then there is Table B. I understand we don't need to have it read into the record.

The Trial Examiner: You don't need to read it.

The Witness: "Other laterals of reduced size are sufficient for the delivery of resale gas alone. Such laterals of reduced size for resale gas are shown below in Table C in comparison with the laterals used jointly for resale and direct sale gas:"

I then list Table C.

"Laterals of the reduced diameter shown above are consistent in size with the laterals already serving communities in which the market for resale gas fixed the size. For instance, the reduced Pueblo Lateral is the same size as the Colorado Springs Lateral whose size was fixed by the resale gas requirements.

"4. River Crossings for Resale Gas Alone.

"The Arkansas River crossing is a part of the 20-inch line north of the river. It supplies the gas carried by that line. It comprises six 10-¾-inch lines, the aggregate flow capacity of which is practically identical with that of the 20-inch pipe. The Huerfano River crossing in the present 22-inch line has seven 10-¾-inch lines instead of the six lines in the Arkansas River crossing. The seventh line is not required in all 20-inch Denver line for resale gas alone.

"The 16-inch Pueblo Lateral now handling both direct sale and resale gas crosses the St. Charles River with two 10-¾-inch lines. The 8-⅝-inch Pueblo Lateral required for resale gas alone requires only two 6-⅝ lines in this same river crossing.

"All other river crossings are of capacity none too great even for a 20-inch line and are required as installed in an all 20-inch Denver line. The loop lines at the Huerfano and Apishapa Rivers and the Sand Creek were installed as insurance against washouts and are required as installed in an all 20-inch Denver line. The river crossings of reduced capacity required in an all 20-inch Denver line for resale gas alone are shown in Table D in comparison with the river crossing lines as actually installed:"

Then follows Table D.

"5. Meter Stations Not Needed for Resale Gas.

"Denver line built for resale gas alone would not require the following meter stations which are used solely for the measurement of direct sale gas:"

Then follows Table E.

"6. Compressor Stations on a 20-inch Denver Pipe Line for Resale Gas Alone.

"A 20-inch Denver line for resale gas alone developed

under the same principles of design as the 22-inch line actually built calls for compressor stations in the same locations and, initially of the same size as those actually built. Such sizes are—Bivins, 3,000 hp.; Clayton, 3,000 hp.; Canyon, 3,000 hp.; and Devine, 2,000 hp.

The capacity of the 20-inch line is most effectively increased in later stages of development by the installation of intermediate booster stations when the ultimate capacities required are commensurate with the expected future resale domestic and regular industrial obligations. Such a step involves installing a 3,000 hp. booster station at Dalhart, an 1,800 hp. booster station near the Cimarron River about midway between Clayton and Canyon, an 1,800 hp. booster station near the Apishapa River about midway between Canyon and Devine and a third booster station of 1,800 hp. near Colorado Springs (later referred to as the 'Springs' station) together with an increase in capacity of the Devine station to 3,200 hp. Vertical 600 hp. multicylinder two cycle engines such as those recently installed in the line are suitable for such booster and peak load service.

"The final stage of development required for the later years involves increasing the capacity of the Dalhart, the Clayton, the Cimarron and the Apishapa stations by 1,200 hp. each.

"In the Bivins station 3,000 hp. is sufficient for resale gas until 1941 when one 600 hp. unit in the present building is required to offset falling suction pressures. A second 600 hp. unit is required to be installed in the present building in 1942. In 1943 three more such units are required in a new building in anticipation of a 150-pound suction pressure.

"The gross net pipe line flow capacities of the several stages of development computed for the geographical load distribution of the resale domestic and regular industrial obligations are shown by Table F. Gross capacity is that with all compressor units in operation. Net capacity is that with the largest unit in each station out of commission. These flow capacities are shown in terms of salable output on the one hand and line input including fuel on the

other hand. The capacities are shown for the whole system north of Bivins and for Colorado Interstate's system north of Clayton."

I believe there is nothing about Table F that I need explain at this time.

"7. Peak Load Obligations and Line Capacity of a Denver Pipe Line for Resale Gas Alone.

"Table G which follows on Page 10 shows in the second and third columns, year by year (a) the total domestic and domestic and regular industrial peak load obligations and (b) the total peak load obligations on account of resale gas, for the entire Denver pipe line in January and February of that year. These obligations cover those actually developed in the past as well as those expected in the future. The figures are based on an exhibit already presented entitled 'Development of Peak Load Obligations and Line Capacity of the Denver Line.'

"The last two columns show the gross and the net continuous pipe line flow capacities in terms of salable output required for a program of development following the same principles as to relation between obligations and line capacity as governed the development of the line actually built. These figures were taken from Table F and are set down to the nearest 1,000,000 cubic feet per day."

In this Table I will call attention to the fact that the capacity is first shown as that with only the Bivins station alone. That capacity, when rounded out, corresponds to the stage of expansion called Initial Expansion in Table F, and the next figure of 62,000,000 "Gross With All Engines Running" corresponds to the first stage of expansion as shown in Table F, and each of the sub-headings increases in flow capacity corresponds with the corresponding stages of the development.

"The following Table H shows the maximum daily volumes of gas required from Canadian River Gas Company to meet full load requirements of a 20-in. Denver line for resale gas alone. These requirements are shown in Mcf. per day at the average pipe line sales pressure base of 13.0 pounds per square inch absolute and also in Mcf. per

day at the field pressure base of 16.4 pounds per square inch absolute. The capacity input to the line from the Bivins station is shown and also the capacity input to the Clayton station for transportation to and sale at points north."

By Mr. Dougherty:

Q. Mr. Rhodes, if you will, turn to Page 4 of Exhibit No. 98 under the heading 4. You refer to the Arkansas River crossing. You say that it consists of six lines each of which is 10-¾-inches in diameter. In your statement there with respect to the aggregate flow capacity of that it says:

"* * * practically identical with that of 20-inch pipe."

Now, by that do you mean that all of these six 10-¾-inch lines together have an aggregate flow capacity of one pipe that would be 20 inches in diameter?

A. That is right for the same pressure drop in crossing the river.

Q. Why is it that one pipe 20 inches in diameter has a gross capacity that is so many times greater than, say, the pipe that is substantially one-half of the diameter of it?

A. There are two reasons. One reason is, of course, the cross-sectional area of the 20-inch pipe is about four times the cross-sectional area of the 10-inch pipe. That would amount to a 4 to 1. In addition to that, as pipes grow larger the coefficient of friction grows smaller, the combined effect of which, doubling the diameter, increases the capacity to carry gas about six times.

Q. Does that same principle explain why a pipe line that is only two inches in diameter greater than that that exists north of the Arrkansas River is able to take care of industrial sales delivered to the Colorado Fuel & Iron Company?

A. Yes, that is true. The flow capacity of the 22-inch line, namely 10 per cent bigger in diameter, is approximately 30 per cent greater than that. In other words, the 22-inch line for exactly the same pressure drop would carry almost 30 per cent more gas, between 25 per cent and 30 per cent. I can't read the chart accurately enough for that.

Q. Is the formula which you used, which you apparently referred to on a chart there, one that is accepted in the natural gas industry as being an accurate and appropriate method of determining pipe line flow capacity?

A. Yes, that is the basis of the Weymouth formula, which is almost in universal use.

Q. That is the formula by Thomas L. Weymouth, the gas engineer?

A. That is true.

Q. As I understand the study which is embodied in this Exhibit 98, is in effect what would have been required if this pipe line were projected only to sell gas to the various public utility companies for distrbution for all purposes by them?

A. That is true, but with the further point that it is the pipe line that would have been built with the same design principles which were used in designing the line as actually built.

Q. As I understand it, you have not attempted to make a reproduction today—not a "reproduction" but a line design as of today of that system?

A. That is true.

Q. You have built this exhibit up on a pipe line project on the basis had it been constructed in 1928 to take care only of the gas sold by Colorado Interstate Gas Company for resale and also whatever is sold between the Bivins station and Clayton?

A. That is correct.

Mr. Dougherty: That is all of the direct we have.

The Trial Examiner: Mr. Dougherty, do you wish to identify this sheet of paper with the exhibit at this time?

Mr. Dougherty: Yes. I want to ask Mr. Rhodes a question about it first.

(Discussion outside the record.)

Mr. Dougherty: There has also been a statement prepared titled "Peak Months Deliveries at Clayton, New Mexico for Colorado Interstate Gas Company's Requirements of Gas Sold for Resale, 1928 to 1947, inclusive," which I would like to have marked for identification as Exhibit No. 99.

The Trial Examiner: It will be marked for identification as Exhibit No. 99.

(Exhibit 99, Witness Rhodes, marked for identification.)

By Mr. Dougherty:

Q. Have you had that statement prepared under your supervision, Mr. Rhodes?

A. Yes, I have. These figures are for the average month of 31 days—I mean the maximum month of 31 days, and the average days in that month are commensurate with the figures shown in Table H in Exhibit 98.

Q. That is the last column of Table H in Exhibit No. 98?

A. The last column of Table H in Exhibit 98 shows the line capacity at Clayton north and this Exhibit 99 shows the average day and the maximum month for the resale of gas in the same years.

Q. I assume that, of course, is something entirely different than during the peak month or any peak day?

A. Yes. The peak day during the peak month is likely to be fully 50 per cent higher than the average day in the peak month.

Q. Do the figures on Exhibit 99 relate, as you state, only to the gas delivered at Clayton for the Colorado Interstate Gas Company, which in turn the Colorado Interstate Gas Company sells to the Public Service Company of Colorado for distribution?

A. It is solely gas sold for resale by the public utility.

Q. Included in that term of "public utility" is termed the municipality of Colorado Springs, is that correct?

A. Yes.

Q. Exhibit No. 79, statement showing the volumes of gas produced in peak months and average daily deliveries in peak months, shows in Column 1: "Peak Month Deliveries" under the heading of "Colorado Interstate Gas Company, Clayton, New Mexico" and then in parenthesis "Denver Line."

That column, I take it, includes not only the quantities of gas that you have shown on Exhibit No. 99 but all gas which Colorado Interstate Gas Company buys at Clayton for sale to the direct industrial customers?

A. That is correct. Mr. Lusk's exhibit shows all of the

gas that goes up the line, whereas this Exhibit No. 99 shows only the resale gas.

Q. And is that same situation true with respect to the figures which are contained in Exhibit No. 66 which is your exhibit referred to as the "Development of Peak Load Obligations"?

A. That is true. My Exhibit No. 66 deals with all of the gas but it breaks it down into considerable detail.

Q. Are these figures on Exhibit No. 99 actual peak month deliveries for the past or at least the average days or computed from that as distinguished from what you referred to as the peak load obligations in Exhibit No. 66 or are these on Exhibit No. 99 the peak load obligations for that month?

A. These figures in Exhibit No. 99 are based on actual deliveries of gas in the maximum months from 1939 back, and estimated future maximum months from 1940 to 1947 that are based on the estimated future sales.

(Vol. XXII, pp. 3149-3163.)

* * * * *

Q. Now, Mr. Rhodes, you have made a careful study of this, I am sure. What size line would you recommend just to take care of the direct industrial consumers?

A. I have never given any consideration to the size of line which would be required by that business because long distance transmission lines ordinarily can't be built economically for these large consumers to whom gas has to be sold at a very low price.

Q. Well, Mr. Rhodes, if you haven't given any study to what size line would be necessary to serve these direct industrial consumers; then just why did you give so much study to the size of line which would be required to take care of these resale consumers?

A. So we would know what size line would be required to handle this particular class of business.

Q. Don't you think that it is—in order to present a fair and complete picture here, you would have to present a companion study which would show just exactly the size of the line you would need to take care of the direct industrial consumers?

A. Why, not at all, because I previously testified that

we wouldn't have built a line up here to serve them in the first place.

Q. You wouldn't have built a line to the Colorado Fuel & Iron to serve it if you hadn't had the Denver load, would you?

A. That's what I just said. Pipe lines are built to serve combinations of industrial and domestic business, but the long lines are really built solely to serve the big industrial consumers particularly when you build your line right into a coal mining territory.

Q. Yes, about the only place where a line just for the benefit of large industrial consumers would be really feasible would be where the industrial consumer is located in some proximity to the source of supply like the American Smelting & Refining Company refinery there in the Amarillo field?

A. Yes, or where the industrial consumers are located at a point more remote from any source of fuel than the gas field.

Q. How long would it take you to make a computation according to your formula there as to what size you would need if you just had the direct industrial customer load?

A. Well, in designing a line you have to design a line to serve this business economically, and I don't believe I can design a line as a companion to this line which could serve the direct sale gas economically.

Q. Of course, you could do it from an engineering standpoint leaving out the economic phases of it, couldn't you?

A. Well, we have to consider the economics of it in the engineering design.

Q. I was just asking the question from an engineering standpoint, just exactly from an engineering standpoint, just exactly what size line you would need to take care of this direct sale industrial load. How long would it take you to compute that?

A. I can give you approximately a size of line which would carry the load under like pressure conditions of this line. That's no job. I can read that off a piece of paper, but it wouldn't design the line. Roughly speaking, it would be a 12-inch line.

Q. A 12-inch line would take care of all the peaks of the complete direct industrial load?

A. It could be made to do so.

Q. It could be made to do so?

A. Yes. I'm just giving you an approximate size of line. Now, there is a great deal more to a pipe line than the diameter of a pipe.

Q. In other words, it could be made to do so. By that you mean that there could be enough pressure put on that small line to push the gas through?

A. It is a matter of how much power you use.

Q. Yes, but, of course, it would be uneconomical to apply the pressure that would be necessary to apply in that 12 inch line?

A. No, I don't think so, but the whole business would cost more to get the gas to Pueblo, for instance, than the Colorado Fuel & Iron would be willing to pay for it.

Q. How many compressor stations would you have to have? Would your have to have more than you do now?

A. I don't know.

Q. It would take quite a bit more compressing stations to build up the pressures necessary to push gas through that 12 inch line, wouldn't it?

A. It might. It's not quite as simple as that.

Q. Well, then, in your opinion would it be necessary to have more compressing stations than you have now, or less?

A. Probably more.

Q. Of course, if you made that a 20 inch line, it would be better from an operating standpoint, wouldn't it?

A. I don't know as it would.

Q. Well, it would, wouldn't it? Would it?

A. Of course, if you made the line big enough you wouldn't have to pump the gas at all, you could run it right from the wells. It is easier to run that kind of a line than one with pumping stations, to be sure.

Q. Of course, you would want to build a line which would be most practical from an engineering standpoint. Would a 20 inch line be more practical from an engineering standpoint than a 12-inch line?

A. Not for that business.

Q. Would you recommend a 12-inch line or a 20-inch line?

A. Well, it certainly wouldn't be a 20-inch line, and as

I state, a 12-inch line—what it would be would be the result of a considerable economic study as to what is the best kind of line to build to handle that business.

Q. You wouldn't want to recommend at this hearing here at this time without additional study that a 12-inch line would take care of this industrial load, would you?

A. No, I wouldn't be willing to recommend any size of line without a very considerable study and probably my indications at the present time would be not to build a line, if that is all the business you had.

The Trial Examiner: The first of that is true, isn't it, Mr. Rhodes? You wouldn't build a line for the sole purpose of serving resale customers; that is, the average resale customer, we'll say, that has a large domestic load and a very few industrial customers?

The Witness: Well, that isn't so clear, because the total volume of business is enough so that you can get the advantage of the big increase in capacity with a small increase in pipe diameter. You see, roughly speaking, it would only cost about 50 per cent more for a 20-inch system than for a 12 inch system, and it will carry two to three times as much load.

The Trial Examiner: Yes, but what I mean is: If you were to connect no industrial customers at all, you would give it considerable study before you would construct a pipe line such as this pipe line?

The Witness: It is very difficult to justify any long pipe line purely for domestic consumers. You don't get enough use out of the capacity that you have to provide. Ordinarily, you wouldn't get on the average more than 25 or 30 per cent use of that capacity which makes it difficult to justify it.

The Trial Examiner: You may proceed, Mr. March.

By Mr. March:

Q. Mr. Rhodes, you have both industrial consumers and domestic consumers on your resale load, do you not?

A. Yes.

Q. Now, let's see, let's turn to Page 7. You state here

regarding suction pressures—I'll read the statement for the record here on Page 7:

"In the Livins station, 3,000 horsepower is sufficient for resale gas until 1941 when one 600-horsepower unit in the present building is required to offset falling suction pressures. A second 600-horsepower unit is required to be installed in the present building in 1942. In 1943 three more such units are required in a new building in anticipation of a 150-pound suction pressure."

Now, I know that we have discussed the suction pressure to a limited extent heretofore, but I want to know how you arrived at your conclusion that by 1943 the suction pressures would reach 150 pounds.

A. It is purely a matter of judgment in watching the way gas fields have been operated, that it would be necessary to have that pressure pulled down to about 150 pounds in the near future to make it easily possible to handle the gas field. I reached that conclusion myself and later talked it over with Max Watson and found that he had reached the identical conclusion at almost the same identical time. It is a matter of having enough difference in pressure between your station and your operating wells to have a convenient means of controlling and dispatching the variations in your load.

Q. If your suction pressure is going to be 150 pounds by 1943, what would be your well pressures?

A. I don't know.

Q. You didn't give that any consideration?

A. No.

Q. That has nothing to do, then, with the declining pressures of the field?

A. Only indirectly.

Q. Well, how, indirectly?

A. Well, as the field pressures go down, naturally the pressure at the compressor stations go down, but I have found it in my experience in watching the behavior of certain other fields with big wells in it, like this field, that it is rather difficult to maintain such pressures of very much over a third of the well pressures and still have the ability to control properly the delivery of gas into the pipe lines.

Now, this 150 pounds which I have taken here is considerably over a third of the virgin pressure of the wells.

Q. What field have you got in mind?

A. I had in mind the Monroe gas field in Louisiana which is a field very similar to this in that it has large wells of 15 or 20 million feet a day, and also the Richland gas field which is near the Monroe gas field and has since been exhausted. In the case of those fields, at the present time with the average well pressures probably—oh, four or five hundred pounds, the compressor stations are running with suction pressures of a hundred pounds or less.

Q. The well pressures are over 400 pounds and the suction pressure less than 100 pounds?

A. Yes.

Q. What has been your experience in observing pressures in the Panhandle field?

A. What?

Q. What has been your experience and your observations in the Panhandle field, the relation between the well pressures and the suction pressure?

A. I haven't made any particular study of that, except as I say, I reached certain conclusions that Mr. Watson completely confirmed when I talked with him about it.

Q. In other words, you are not familiar with the behaviors of the pressures in the Panhandle field?

A. I haven't studied them in detail. I have been familiar with the Panhandle field for more than ten years, but I haven't been operating in the field.

Q. Do you know what the present suction pressure is at the Bivins station?

A. Oh, it varies. I think they are able to keep it up to pretty close to 250 pounds right now.

Q. Do you know what the present average well pressures are, approximately?

A. Whose well pressures?

Q. The present average well pressures in the Panhandle acreage—I mean, the Canadian River acreage in the Panhandle field.

A. Something over 350 pounds.

Q. You don't have in mind the exact figure?

A. Not the exact figure.

Q. If 150 pounds suction pressure would be reached by 1943, then how long would it take to reach, and what will happen by 1947?

A. Why, I think the pressures can probably be held at 150 pounds with increasing difficulty. It is difficult to operate properly unless you have a large margin of pressure between the wells and the delivery points at your compressor stations and they have been working under too narrow a margin recently.

Q. How low do the suction pressures have to go before it is uneconomical to operate?

A. I don't know. I haven't figured that out.

Q. You haven't given that any consideration?

A. No.

(Vol. XXIII, pp. 3210-3219.)

---

15. Volume Sales and Revenues of All Gas and of Resale Gas Only, Colorado Interstate, 1928 to 1939, Inclusive, and As Estimated, 1940 to 1947, Inclusive.

Lusk in his Exhibit 43 and in his testimony with respect thereto (Vol. VI, pp. 751-758, 769-778; Vol. IX, pp. 1249, 1250) gave a complete statement of the volume of all kinds of gas sold by both Canadian and Colorado Interstate companies off the Denver line and the revenues derived therefrom 1928 to 1939 inclusive. Beardsley, superintendent since June, 1928 of that department of Colorado Interstate's business charged with gas measurements and the estimates of future sales and gas engineering work, (Vol. VII, pp. 942, 943) assembled the data which FB&D put together as Exhibit 56. In this exhibit and Beardsley's testimony with respect thereto (Vol. VII, pp. 942-1019) are shown estimated future volume sales and revenues therefrom from both companies off this line for the years 1940 to 1947 inclusive. Each exhibit shows volumes on the pressure bases specified in the sales contracts. Other exhibits, some offered by the companies and some by the Commission's witnesses, adverted to past and future volume sales and revenues. The Commission's exhibits do not express the volumes on the contract pressure bases but use 14.65 lbs. per square inch absolute. When the volumes in the several exhibits are reduced to a common pressure basis there is no real con-

fject. These additional exhibits are: 5, 59, 60, 63, 72, 138, 138-A, 226, 226-A, 262, 290, 293, 300 and 307.

Past and estimated future volume sales of Colorado Interstate may be shown as follows:

Mcf. at Contract Pressure Base.

Year Ended Dec. 31	Resale		Direct Sales— Industrial
	Resale— Domestic	Resale— Industrial	
Actual	(1)	(2)	(3)
1928 (7 mo.)	1,159,569	36,695	2,521,748
1929	3,534,927	776,291	8,312,075
1930	4,765,312	2,104,748	8,364,550
1931	5,304,294	3,059,558	7,891,809
1932	5,596,415	3,291,578	6,999,294
1933	4,794,896	2,474,304	7,591,289
1934	4,526,432	2,898,583	8,121,103
1935	5,283,663	3,446,361	8,188,473
1936	5,813,113	4,172,804	11,944,737
1937	6,588,670	4,869,301	11,535,110
1938	6,617,591	4,436,487	9,504,897
1939	6,818,497	4,779,576	11,663,832
Estimated Future			
1940	7,575,000	4,880,380	11,018,800
1941	8,073,000	5,417,400	11,873,800
1942	8,413,000	5,604,500	11,898,800
1943	8,718,000	5,771,600	11,523,800
1944	9,021,500	5,940,200	11,548,800
1945	9,322,500	6,106,300	11,573,800
1946	9,322,500	6,106,300	11,573,800
1947	9,322,500	6,106,300	11,573,800

Column 1 is found as Column 7, Statement A-5, Exhibit 56.
Column 2 is found as Column 8, Statement A-6, Exhibit 56.
Column 3 is found as Column 3, Statement A-4, Exhibit 56.

The only apparent conflict between the above stated volume sales and that shown in any other exhibits is on Schedule 1 of the Commission's exhibit 293 prepared by the witness, O'Connor. There he estimates for the year 1941 *direct* sales by Colorado Interstate to industrial customers in the total amount of 11,540,700 Mcf. on a 14.65 lbs. per square inch absolute basis. Beardsley, for the company, estimated, as shown above, direct sales to industrial customers for that year in the total amount of 11,873,800 Mcf. on the pressure bases specified in the contracts. The variation in the pressure bases accounts in part for the difference in volume figures. The difference in these two estimates is further accounted for in this way: Beardsley included in his figure the amount expected to be sold to the Municipal Power plant at Colorado Springs as an industrial customer, which it is under the contract between the Colorado Interstate and the City of Colorado Springs, (see Exhibit 7-E, pp. 3, 4) whereas O'Connor included this sale in the estimated amount of 470,000 Mcf. on a 14.65 basis as a sale for resale to utilities.

Hendee, general manager of both Canadian and Colorado Interstate, stated that Beardsley for a long time past had been making estimates in the ordinary course of his duties with the companies as to future sales. Such estimates were used in making additions to the compressor stations and other plant and for corporate purposes wholly unconnected with any rate case. He stated that on the basis of such estimates as to future volumes made by Beardsley in the past Canadian had installed a new compressor station at Dalhart and enlarged its existing station at Bivins and that Colorado Interstate had made additions to its stations at Canyon and Devine (Vol. VIII, pp. 1083-1085). From the several exhibits above enumerated, particularly Beardsley's 56 and Lusk's 43, the following statement of Colorado Interstate's revenues from gas sales for past years and as estimated 1940 to 1947 inclusive and miscellaneous rentals may be made as follows:

Calendar Year	Resale Gas		Direct Sale Gas	Rentals
	Domestic Gas	Industrial Gas		
	(1)	(2)	(3)	(4)
Actual				
1928(A)	$ 462,770	$ 8,006	$ 358,785	453
1929	1,404,805	146,432	1,086,425	1,672
1930	1,829,854	338,588	1,105,289	4,199
1931	1,955,392	472,647	971,640	5,702
1932	2,042,631	505,479	858,480	5,150
1933	1,738,060	377,686	934,408	5,350
1934	1,630,312	413,875	980,293	5,493
1935	1,834,747	470,776	987,121	5,520
1936	1,972,331	565,588	1,406,657	6,818

Column 2 is found as Column 8, Statement B-6, Exhibit 56.

Column 3 is found as Column 3, Statement B-4, Exhibit 56.

Column 4 for the years 1928 to 1938 inclusive corresponds to Line 4, Statement C-1, Exhibit 43 and the figures therein for 1939 to 1947 inclusive were given in testimony by the Witness, Lusk, in Vol. XLIX, p. 6737, et seq. There he stated that the rentals in respect to sales of gas of all kinds would be as shown in Column 4 for the years 1940 to 1947 inclusive and that in respect to resale gas alone the figures would be for 1939, $9,843 and for each of the years 1940 to 1947 inclusive they would be $9,856.

16. Peak Load Obligations and Line Capacity of the Denver Line as Found Through the Winter 1939-40, and Estimated Through 1947, and Estimated Necessary Additional Facilities.

The Denver Line, as the evidence already abstracted shows, was designed and constructed by FB&D. The witness, Rhodes, as chief engineer, checked each item of the design. (Vol. XXII, pp. 3149, 3150. Ex. 98, p. 1.) It was necessary to estimate volumes, peak loads and line capacity prior to construction. (Vol. IX, p. 1191.) Preconstruction estimates have been closely borne out. (Vol. IX, pp. 1194, 1195.) For this case he took the record through the winter 1939-1940 and estimated, first, the peak load obligation; second, the line capacity, with estimated additional compressors; and then compared the two through 1947. This study was admitted herein as Exhibit 66. For such study he considered all volumes, loads and deliveries of the Denver Line north of the Bivins compressor station.

As to peak loads he said: "I took the figures that are shown by the books and records of the company as having been delivered to the various consumers on the peak days." (Vol. IX, p. 1181.) He expressed all peak load obligations in "cubic feet per day at the contract basis pressures provided for in the several gas sales contracts. The average base pressure closely approximates 13.0 pounds per square inch absolute." (Ex. 66, p. 1.). These contract bases are shown in Exhibit 59 and, of Colorado Interstate's contracts, six are at 13.2; three are at 12.9; and two, for negligible volume sales; namely to Arkansas Valley Natural Gas Company and to the United States Department of the Interior, are at 12.25 and 12.4 respectively. When weighted for volumes the average approximates 13.0, and the amount of any individual contract base does not vary therefrom by more than 1% to 2%. (Vol IX, pp. 1180, 1181.)

For this study he also considered the priority of domestic over industrial gas specified in each of the sales contracts already abstracted above. No difficulty was encountered in separating out all direct sales of industrial gas, namely: to American Crystal Sugar Company, The Atchison, Topeka and Santa Fe Railway Company, The City of Colorado Springs for its power plant, The C. F. & I.,

The Colorado Portland Cement Company and the United States Government for its Fort Lyon Hospital and for the helium plant at Thatcher. (Ex. 59.) He was also able to separate out the gas sold to distributing companies for resale to special industrial customers, all these being large consumers with daily meter readings available. As to gas sold to the distributing companies for resale to small industrial consumers, called regular industrial customers, he included the amount sold them along with gas sold to domestic users, since the amounts were small and none of them had daily meter readings. (Ex. 66, p. 1.)

The final result of his study is presented as Table X, Page 21 of Exhibit 66, as follows:

Development of Peak Load Obligations and Line Capacities of the Denver Pipe Line.

Mcf. Per Day at Contract Pressure Base

Calendar Year	Peak Load Obligations: Domestic and Regular Industrial	Peak Load Obligations: Total All Classes of Gas	Line Capacity Provided: Net With Spare Engines Out	Line Capacity Provided: Gross With All Engines Running
Actual				
1929	24,454	58,061	70,000	80,000
1930	44,258	89,578	70,000	80,000
1931	56,180	102,737	90,000	108,000
1932	59,025	104,219	90,000	108,000
1933	53,497	91,439	90,000	108,000
1934	48,926	95,974	90,000	108,000
1935	52,266	94,799	90,000	108,000
1936	56,272	113,096	90,000	108,000
1937	63,514	118,563	90,000	108,000
1938	67,366	105,916	90,000	108,000
1939	73,540	133,771	90,000	108,000
1940	79,929	140,926	90,000	108,000
Estimated Future				
1941	89,664	146,996	100,000	124,000
1942	94,092	151,711	100,000	124,000
1943	98,068	155,943	108,000	125,000
1944	102,027	160,161	108,000	125,000
1945	105,952	164,341	108,000	125,000
1946	105,952	164,341	108,000	125,000
1947	105,952	164,341	108,000	125,000

As this same method of determining the peak load obligations and their significance underlies the evidence hereinafter abstracted under the section entitled "Apportionment of Property and Expenses between Direct and Resale Gas, Denver Line" (Rhodes' Exhibit 346, "Methods of Apportioning Costs of the Producing and Gathering Facilities of Canadian River Gas Company and of the Denver Line Between Resale Gas and Direct Sale Gas, 1928 to 1947 Inclusive"), we do here abstract the method and intermediate steps employed in arriving at the results set forth in Table X.

In order to show the effect of weather on the domestic demand, he took the two warm months in the year 1938, during which period the average daily demand was 9,300,000 cubic feet. He then took the two coldest months of the winter of 1938-39, during which period the average daily demand was 32,400,000 cubic feet, the difference between the two average daily demands being 23,100,000 cubic feet, accounted for by cold weather.

The use of gas for house heating begins in some form when the mean temperature falls below 65 deg. F., and such use increases practically in direct proportion as the mean temperature falls below 65 deg. F. The amount by which the mean temperature in any day falls below 65 deg. F. is called the "degree day deficiency" for that day. For instance, if the mean temperature in any day is 55 deg. F., there are 10 degree days deficiency, and when the mean temperature is 45 deg. F. there are 20 degree days deficiency (p. 1154). The sum of the daily degree days deficiency during any period is known as the "total degree days deficiency" for that period. In the Exhibit "degree days deficiency" is abbreviated to "Ddd".

He determined that for the two warm months the average temperature depression Ddd per day was zero and for the two cold months there was 35 Ddd, and by dividing 35 into 23,100,000 he arrived at 660,000 cubic feet per Ddd as representing the increased load due to depression in temperature for one day. He then (p. 1155) developed the maximum domestic obligation for the winter 1938-39 in Table B as follows:

	Cubic Feet
(a) Average daily demand in two cold months at an average temperature depression of 35.0 Ddd.	32,400,000
(b) Increase in daily demand at 15.0 deg. F. below zero with a total temperature depression of 80.0 Ddd, namely 45.0 Ddd. more than the above average, computed at 660,000 cu. ft. per Ddd.	29,700,000
(c) Total estimated daily demand for domestic gas from the Denver line at a mean temperature of 15.0 deg. F. below zero	62,100,000"

(p. 1156)

The maximum demands for the extreme weather in the several areas are shown in Table C, as follows:

		Mean Temperature on Coldest Day (Deg. F.)	Estimated Domestic Load On Such a Day Cu. Ft.)
(a)	Denver Area	—14 deg.	42,157,000
(b)	Colorado-Wyoming area	—20	10,775,000
(c)	Colorado Springs Area	—16	3,251,000
(d)	Pueblo Area	—10	2,230,000
(e)	Arkansas Valley Area	—10	1,304,000
(f)	New Mexico Area	—6	531,000
(g)	Texas Area	—6	1,483,000
	Total	14.5 deg.	61,731,000"

(p. 1157)

The growth in domestic obligations of the Denver Line was determined winter by winter by calculations identical with those above described, and are summarized year by year in comparison with the domestic sales as shown in Table D, as follows:

Calendar Year	"In New Mexico and Colorado Sold During Year Mcf.	Peak Load Obligations Jan. and Feb. Cu. Ft. Per Day	In Texas Sold During Year Mcf.	Peak Load Obligations Jan. and Feb. Cu. Ft. Per Day
1929	3,534,927	21,336,000	127,311	1,206,000
1930	4,765,312	37,017,000	160,243	1,605,000
1931	5,304,294	47,931,000	147,776	1,633,000
1932	5,596,415	49,091,000	129,437	1,338,000
1933	4,811,485	44,072,000	128,942	1,320,000
1934	4,566,300	40,749,000	93,120	1,206,000
1935	5,327,345	43,297,000	126,555	1,310,000
1936	5,860,461	45,241,000	129,898	1,237,000
1937	6,638,703	49,972,000	138,401	1,263,000
1938	6,669,918	54,984,000	129,293	1,269,000
1939	6,874,843	60,248,000	145,962	1,483,000
1940	7,628,500(A)	66,148,000	122,900(A)	1,245,000

Note: (A) These figures estimated."

(p. 1158)

Table E shows the extent to which domestic peak load obligations have increased in the past in comparison with the increase in annual volume of domestic gas sold, as follows:

	"New Mexico and Colorado	Texas
Peak Load Obligations Cu. Ft. per Day		
1939	60,248,000	1,483,000
1929	21,336,000	1,206,000
Increase in 10 years	38,912,000	277,000
Annual Volumes Mcf.		
1939	6,874,843	145,962
1929	3,534,927	127,311
Increase in 10 years	3,339,916	18,651
Increased Peak Load Obligation Cubic feet per day per Mcf: Annual Sales	11.65	14.85"

(p. 1160)

Table F shows such future peak load obligations based on the estimated future volumes submitted by Witness Beardsley, as follows:

	"In New Mexico and Colorado		In Texas	
Calendar Year	Sold During Year Mcf.	Peak Load Obligations Jan. and Feb. Cu. Ft. Per Day	Sold During Year Mcf.	Peak Load Obligations Jan. and Feb. Cu. Ft. Per Day
1939	6,874,843(A)	60,248,000(A)	145,962(A)	1,483,000(A)
1940	7,628,500(A)	66,148,000(A)	122,900(A)	1,245,000(A)
1941	8,127,440	74,841,000	123,500	1,149,000
1942	8,468,350	78,812,000	124,000	1,157,000
1943	8,774,300	82,377,000	124,650	1,167,000
1944	9,078,700	85,923,000	125,200	1,175,000
1945	9,380,600	89,440,000	125,800	1,184,000
1946	9,380,600	89,440,000	125,800	1,184,000
1947	9,380,600	89,440,000	125,800	1,184,000

Note: (A) These figures from Table D."

(p. 1161)

As an illustration of the method used in finding the future obligations shown in Table F, he referred to the 1941 peak load obligation in New Mexico and Colorado, where the annual sales are estimated to increase 1,252,597 Mcf. over 1939, whereas the increased peak load obligation at the rate of 11.65 cubic feet per Mcf. annual sales is thus 11.65 times 1,252,597, which is 14,593,000 cubic feet. This, added to the 60,248,000 cubic feet, the peak load obligation for 1939, results in 74,841,000 cubic feet as the 1941 peak load obligation. (p. 1161.)

As to industrial peak load obligations, he also took the months of January and February 1938-39. These peak loads are largely controlled by industrial activity and the extent to which the use of gas is curtailed or shut off to insure the domestic supply. The industrial load is commonly in excess of the load that occurs at any one time because of non-coincident maximum demands. The winter months of January and February were used in the study because these are the months in which the domestic demands are the greatest, and the obligation so determined reflects the maximum requirements of the industrial consumers to be curtailed as may be necessary in extremely cold weather.

The actual peak requirements of special industrial resale gas and direct sale gas were determined from the daily meter readings, and the sum of the individual peaks for the several consumers in January and February was taken as the total obligation. The peak loads for regular resale industrial gas, for which no daily meter readings were available, were estimated at 2% of the total billings for (p. 1162) January and February.

Table G shows the distribution of the industrial peak obligations to the various areas served (p. 1163).

The industrial peak load obligations were then determined year by year from 1929 to 1940, inclusive, in the manner above described (p. 1164), and Tables H, I and J show, in like manner as is shown with respect to domestic gas, sales volumes each year, and the peak load obligations in January and February of each year, in parallel columns for the years 1929 to 1940.

In recent years the resale industrial gas has been running approximately one-half regular industrial and one-half special industrial (p. 1165). It was assumed that each of these two classes of gas would represent substantially one-half of the volumes of sales. It was also assumed, as past experience had demonstrated, that the relation between peak load obligations and annual sales would continue in the future.

In the case of regular industrial gas, it is shown by Table H that the average annual sales for the years 1937, 1938 and 1939 were 2,363,061 Mcf. per year, and that the average of the peak load obligations was 11,279,000 cubic feet per day, so that the peak load obligations on account of regular industrial gas sales have been 4.77 cubic feet per day for each Mcf. of gas sold during the year. Accordingly, the future peak load obligations for regular industrial gas were estimated as being 4.77 cubic feet per Mcf. per year (p. 1166).

As to peak load obligations year by year, and annual sales of special industrial gas, Table H shows a somewhat erratic relationship in 1939, when the cement plant near Fort Collins was given permission to take gas in January and February. Accordingly, the years 1936, 1937 and 1938 being free from such abnormality, were taken as the guide.

During these years, the average annual sales amounted to 2,257,479 Mcf., and the average of the peak load obligations amounted to 6,876,000 cubic feet per day. So that for each Mcf. of special industrial gas sold in those years, there was an average peak load obligation of 3.05 cubic feet.

On such basis Table K shows year by year the future peak load obligations, calculated as follows: (p. 1167)

	"Regular Industrial Gas		Special Industrial Gas	
Calendar Year	Sold During Year Mcf.	Peak Load Obligations Jan. and Feb. Cu. Ft. Per Day	Sold During Year Mcf.	Peak Load Obligations Jan. and Feb. Cu. Ft. Per Day
1940	2,471,940	11,973,000(A)	2,471,940	7,655,000(A)
1941	2,740,980	13,074,000	2,740,980	8,380,000
1942	2,835,075	13,523,000	2,835,075	8,647,000
1943	2,919,150	13,924,000	2,919,150	8,903,000
1944	3,004,000	14,329,000	3,004,000	9,162,000
1945	3,087,600	14,728,000	3,087,600	9,417,000
1946	3,087,600	14,728,000	3,087,600	9,417,000
1947	3,087,600	14,728,000	3,087,600	9,417,000

Note: (A) Actual."

As to direct sales gas during the three years 1936, 1937 and 1939, as shown in Table J the sales had been relatively stable, except that in the years 1936, 1937 and 1939 they were roughly 50% higher than in prior years. During those three years the average annual volume sales was 11,714,560 Mcf., and the average peak load obligation was 48,047,000 cubic feet per day. 1940 was out of line on account of the cement plant at Portland taking gas during January and February (p. 1168). The estimates for 1942 and 1943 differ so little from the average sales in 1936, 1937 and 1939 that the future obligations for direct sales may reasonably be taken at the average obligation during these three years of 48,047,000 cubic feet per day.

In Table I, the combined peak load obligations 1929 to 1947 are shown, as follows:

Calendar Year	"Colorado and New Mexico Resale		Texas Resale		
	Domestic and Regular Industrial	Special Industrial	Domestic and Regular Industrial	Special Industrial	Direct Sale to Consumer
Actual					
1929	22,947	.....	1,507	.....	33,607
1930	42,270	6,696	1,988	545	38,079
1931	54,055	8,791	2,125	371	37,395
1932	57,180	5,059	1,845	474	39,661
1933	51,738	5,274	1,759	493	32,175
1934	57,430	9,485	1,496	442	37,121
1935	50,609	5,267	1,657	473	36,793
1936	54,572	6,582	1,700	724	49,518
1937	61,757	6,756	1,757	851	47,442
1938	65,677	7,289	1,689	871	30,390
1939	71,606	12,067	1,934	983	47,181
1940	78,121	7,655	1,808	858	52,484
Estimated Future					
1941	87,915	8,360	1,749	900	48,072
1942	92,335	8,647	1,757	900	48,072
1943	96,301	8,903	1,767	900	48,072
1944	100,252	9,162	1,775	900	48,072
1945	104,168	9,417	1,784	900	48,072
1946	104,168	9,417	1,784	900	48,072
1947	104,168	9,417	1,784	900	48,072"

(p. 1169)

In his study the pipe line capacities referred to are the continuous flow capacities with load distributed along the line pro rata with the 1939 peak load obligations (p. 1170). Pipe line capacities were determined with all compressors in service, and with the largest engine in each station out of service. His calculations were based on the full use of the power capacity of the engines in service, which is sometimes not wholly available on account of limitations of compressor cylinder diameters. In calculating the gross capacity of the system with all engines in operation in 1939 geographic distribution of the total combined peak load

obligations was used. In determining the net capacity of the system with the spare compressor equipment out of operation, the 1939 geographic distribution of the domestic and regular industrial peak load obligations was used.

In 1928 when the Denver Line was first completed, its flow capacity was fixed by the power in the Canyon Station. Three 1,000 h.p. units were installed. The Bivins Station of three 1,000 h.p. units was ample to furnish any gas into the line that could be passed through the Canyon Station.

In the fall of 1930 the Clayton Station, containing three 1,000 h.p. units, and the Devine Station of two 1,000 h.p. units, were placed in operation. The line capacity was thus increased, but the Bivins Station was still ample (p. 1171).

In 1939 it was necessary to increase the capacity of the Bivins Station by the installation of a 600 h.p. unit. This was necessary to meet changing field conditions, and the line capacity was not increased.

In 1940 the Dalhart Station was constructed with four 600 h.p. units, and later another unit was added. Canyon Station was reinforced by the addition of a 600 h.p. unit, and the Devine Station by the addition of two 625 h.p. units.

A further step in the development of capacity will be necessary with increasing loads. The critical section of the line is the Devine-to-Denver section, which will require a booster station near Colorado Springs to secure any increase in line capacity. A station of 1800 h.p. in three units will be required, and an additional 600 h.p. unit at Canyon.

As the field pressures drop, additional equipment will be required at Bivins. With a suction pressure of 150 pounds per square inch gauge, a total capacity of 6600 h.p. will be required (p. 1172).

The gross and net flow capacity of the various stages of development were determined as shown on Table N above (p. 1173).

The following Table M (p. 20 of the Exhibit) includes the estimated necessary additional facilities which will be required to meet the estimated future peak obligations:

Stage and Date Completed	Compressor Stations Name	Total HP.	"Pipe Line Flow Capacity" Net with Spare Engines Out	Gross with All Engines Operating
1st—1928	Bivins	3,000		
	Canyon	3,000	70,000	80,000
2nd—1930	Bivins	3,000		
	Clayton	3,000		
	Canyon	3,000		
	Devine	2,000	90,000	108,000
3rd—1941	Bivins	3,600		
	Dalhart	3,000		
	Clayton	3,000		
	Canyon	3,600		
	Devine	3,200	100,000	124,000
4th—Future	Bivins	6,600		
	Dalhart	3,000		
	Clayton	3,000		
	Canyon	4,200		
	Devine	3,200		
	Colo. Springs	1,800	108,000	125,000"

Certain of the working papers, namely, Degree Days, January 25 to 26 inclusive, 1939 and 1940, for Denver, Colorado Springs, Pueblo and La Junta, as shown by the Weather Bureau and used in the foregoing studies, were introduced by the Commission as Exhibits 61 and 62.

17. Peak Load Obligations and Line Capacity of an Assumed Denver Line for Resale Gas Only, as Estimated Through the Winter 1939-1940, and as Estimated Through 1947, and Estimated Necessary Additional Facilities.

The same witness Rhodes, using the same methods as used in the foregoing study for all gas, developed in his Exhibit 98 the following results for an assumed 20 inch line that would take care of resale gas only:

"Table G

Peak Load Obligations and Line Capacities of a 20 Inch Denver Pipe Line for Resale Gas Alone.

Mcf. per Day at Average Sales Contract Pressure Base of 13.0 Pounds Absolute.

Year in Which Peak Occurs in January or February	Peak Load Obligations		Saleable Capacity Provided	
	Domestic and Regular Industrial	Total Resale Gas	Net with Spare Engines Out	Gross with All Engines Running
Actual				
1929	24,454	24,454	45,000	45,000
1930	44,258	51,499	58,000	62,000
1931	56,180	65,342	80,000	87,000
1932	59,025	64,558	80,000	87,000
1933	53,497	59,264	80,000	87,000
1934	48,926	58,853	80,000	87,000

Notes: T These flow capacities are inputs to Canadian's pipe line at Bivins for fuel and all sales from the pipe line north of Bivins.

C These flow capacities are inputs to Colorado Interstate's pipe line at Clayton for fuel and all sales from the pipe line north of Clayton."

(Exhibit 98, p. 8).

One of the working papers used by Rhodes and entitled "Peak Month Deliveries at Clayton, New Mexico, for Colorado Interstate Gas Company's Requirements of Gas Sold for Resale, 1928 to 1947 Inclusive", showing amounts at 16.4 pounds base pressure and being commensurate with the figures set forth in Table H of Exhibit 98, was introduced as Exhibit 99. (Vol. XXII, p. 3161, et seq.)

---

18. Original Cost of Colorado Interstate's Portion of the Physical Properties of the Denver Line to December 31, 1939, and as Estimated From 1940 to 1947, Inclusive.

For Colorado Interstate there was introduced, through the witness Lusk, Exhibit 67 entitled "Original cost of the Denver Pipe Line Properties, December 31, 1928 to 1939, Inclusive". It shows such cost for the Canadian River Gas Company as well as Colorado Interstate. Here we deal with the original cost of the physical properties of the Denver Line belonging to Colorado Interstate; that is, that part of the line north of Clayton Junction, but this exhibit shows total original cost of Canadian River's portion of the line in the amount of $4,028,196 as of December 31, 1939. It is also to be noted that here we deal with the physical properties only of Colorado Interstate's portion of said line, leaving for a subsequent section the abstracting of the evidence as to the cost of Colorado Interstate's contracts.

The original cost of the physical properties of Colorado Interstate's portion of said line at December 31, for each of the years 1937, 1938 and 1939, as set forth in Statement 2 of Exhibit 67, is as follows:

Original Cost of Denver Pipe Line Properties at December 31, 1928 to 1939, Inclusive.

Item No.	Account Nos. (Company)	Description	1937	1938	1939
	Owned by Colorado Interstate Gas Co.				
1	218; 219; 221; 223; 224; 227	Compressing Stations	$ 1,563,211	$ 1,629,709	$ 1,617,612
2	218; 220; 226	Transmission Lines	9,505,640	9,509,222	9,499,149
3	218; 222; 225; 227	Measuring Stations	165,901	165,583	160,172
4	218; 219; 223; 227	Other Structures and Equipment	60,845	72,565	79,765
5	255	Telephone System	151,725	151,779	151,764
6	249; 253; 257	General Property	118,638	125,086	132,630
7	Total		$11,565,960	$11,654,844	$11,641,092
8	Adjustment for Items Charged to Expense which are Properly Capital		201,906	244,103	284,806

9 Adjustment for General Construction Costs Applicable to Net Property Additions and Capital Items Expensed	143,845	153,699	155,244
10 Total Original Cost of Colorado Interstate Gas Co. Property	$11,911,711	$12,052,646	$12,081,142

*We show here original cost at December 31 for the years 1937, 1938 and 1939 only. Future Additions are shown infra.

The figure $11,641,092, being the total original cost at December 31, 1939, before the adjustments itemized in Items 8 and 9 supra, corresponds with the actual figure on the books of the company, as both Commission and respondent's accountants agree, except for an item of $14,334.51. The Commission's witness Schutte, on being examined by Commission's counsel with respect to Lusk's Exhibit 67, and particularly Statement 2, said that he had compared it with the books of the company as of December 31, 1939, and the only difference was that one item, which he explained:

> "A. In the transmission group of accounts, which is Item 1 of Statement 2 of Exhibit 67, Mr. Lusk included the cost of five farms that are owned by the Colorado Interstate Gas Company and which are carried on its books and financial statements as other physical property." (Vol. LXV, p. 9389.)

There was then introduced by the Commission, through Schutte, Exhibit 195 entitled "Colorado Interstate Gas Company—Comparison of Original Cost of Denver Pipe Line Properties as of December 31, 1939, per Company Books with Exhibit 67 Introduced by Mr. William A. Lusk," which showed the only difference to be this item of $14,334.48. (For some reason the amount is expressed in Exhibit 195 as 48 cents instead of 51 cents.) This Exhibit shows that in 1927 and 1928 the company purchased rights of way over these five farms and paid an aggregate sum of $543.50, which amount appeared in the Cost of Right of Way, and is included in the transmission groups of account. Each farm had a mortgage on it. Later on the mortgages were foreclosed. Colorado Interstate, not being able to negotiate with the mortgagees, acquired the farms at the foreclosure sales in order to protect their rights of way, at a total cost of $14,334.48 (.51), which was carried, as above stated, not in the transmission groups of account, but as "Other Physical Property."

Through this same witness Schutte, and in his Exhibit 139, the Commission presented its statement or original cost, as follows:

Colorado Interstate Gas Company.
Summary of Investment in Gas Plant Per Books and as Adjusted as of December 31, 1939.

	Gas Plant Held for Future Use		19,994.71	
	Gas Plant Adjustments		2,352,941.17	
	Total	$14,596,043.21	$13,929,360.08	$492,547.30

In the above summarized statement we have left out Column 3, which showed quantities, and Columns 5 and 6, which showed the Examiner's debit and credit adjustment entries, because we deal with them seriatim hereafter.

Also we deal with that portion of the foregoing statement entitled "Franchises and Contracts" in the next section of this abstract entitled "Costs of Contracts".

The items contained in Column 8, as explained by the witness Schutte, are not presently deducted from original cost but are earmarked for consideration by the Commission. We deal with the evidence respecting them after we have first abstracted the evidence with respect to adjustments already made.

Comparing these two summarized statements of the original cost of the *physical* property of respondent's portion of the Denver Line, as of December 31, 1939, the following items of adjustment are the only ones about which company and Commission disagree. We first deal with the adjustments made by the company (Lusk).

As Item 8, Statement 2, Exhibit 67, Lusk makes annual adjustments "for items charged to expense which are properly capital", which, accumulated to December 31, 1939, amounted to the total of $284,806. He said:

> "In general they represent maintenance and operating expense items which according to my classification, should not have been expense but should have been capitalized." (Vol. IX, pp. 1275, 1276.)

And again:

> "My reason principally behind that is that they are preventive and not corrective measures and therefore should not have been expensed." (p. 1277.)

He knew that when Colorado Interstate began business and was setting up its accounts in 1927 and 1928, it voluntarily used the Pennsylvania Code of Accounts effective January 1, 1920, for natural gas companies as a guide in setting up such books (p. 1277). He referred to and quoted from that code and later extracts therefrom were put to-

gether as Exhibit 75 (XVII, p. 2399). One such quotation is as follows:

> "Betterments are physical changes in structures or equipment, the object of which is to make the structures or equipment affected more useful or of greater capacity than they were at the time of their original installation or acquisition. The utility shall charge as a betterment to the appropriate sub-account of '101. Fixed capital installed since December 31, 1919' account that portion of the cost of such changes as will, when added to the original cost of the structures or equipment bettered, give the cost of the structures or equipment in their bettered condition." (Vol. IX, p. 1279.)

The items covered by this amount he described as cathodic protection of the main line and laterals, rock weighting of the main line, and rip rap and re-inforcement of stream crossings (Vol. IX, pp. 1276, 1279). He then said:

> "From my experience of long transmission pipe lines I am of the opinion they should have been capitalized and not have been charged under expense." (p. 1279.)

Schutte, for the Commission listed these same items in his Exhibit 196 (Vol. LXV, p. 9473) as follows:

1.	Flood and Washout Control	$ 26,637.68
2.	Rock Weighting	46,683.72
3.	Cattle Guards	4,922.70
4.	Bridges	8,052.93
5	Rip Rap and Revetments—River and Stream Crossings	24,400.99
6.	Roads and Culverts	32,380.69
7.	Gravel, Rock and Shale for Main Line	9,921.87
8.	Cathodic Protection	49,935.20
9.	Profile Maps	2,989.53
10	Lowering Lines	638.33
11.	Spare Parts	5,623.84
12.	All Other, Miscellaneous	72,617.88
	Total	$284,806.36

As Item 9, Statement 2, Exhibit 67, Lusk added $155,244 for "Adjustment for General Construction Cost Applicable to Net Property Additions and Capital Items of Expense." He explained that neither Colorado Interstate nor Canadian "had added interest during construction since the days of the initial construction period in 1928, regardless of the amount of additions and betterments they have put in." (Vol. IX, p. 1281.)

He stated further:

> "I included six and a half per cent for engineering, corporate and other administrative costs on all net property additions year by year and in addition to the six and a half per cent I included one and a half per cent for interest on those net fixed capital additions. The six and a half per cent applies to the item 'Expense' which should have been capitalized as shown by Line 8, but the one and a half per cent interest was not computed on the expense item. * * * The interest was computed solely on the items of fixed capital added during the year." (Vol. IX, p. 1280.)

Exhibits 195 and 196, already mentioned, of the Commission's witness Schutte, were offered in rebuttal of Lusk's inclusion in original cost of the three items of $14,334.51, $284,806.36 and $155,244, respectively.

WILLIAM A. LUSK called as a witness by and on behalf of the respondent, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Brock:

Q. Please state your name.
A. William A. Lusk.
Q. Where do you live?
A. Brooklyn, New York.
Q. What is your occupation?
A. I am chief accountant for Ford, Bacon & Davis, Inc.
Q. How long have you been chief accountant for Ford, Bacon & Davis, Inc.?
A. Well, in this particular line of work with Ford,

Bacon & Davis I could say that it has been for the last ten or twelve years.

Q. What experience have you had in accounting work, that is, accounting work prior to the time that you became connected with Ford, Bacon & Davis, Inc.?

A. I have been with Ford, Bacon & Davis, Inc., approximately eighteen years. Prior to that I spent five years with the Emergency Fleet Corporation as assistant auditor, and general auditor of Wooden Ship Claims just after the termination of the last war. Prior to that I had several years war service, and prior to that I was engaged as a junior accountant in New York City, working for M. G. Corbitt & Company.

I worked for a time for the American Hawaiian Steamship Company, and prior to that I worked for an express company which is now out of business. That was immediately following the evening courses I had taken at Columbia University. That goes back to 1910.

Q. Are you a Certified Public Accountant?

A. No, sir.

Q. During the eighteen years that you have been connected with Ford, Bacon & Davis, Inc. have you been continuously employed in connection with accounting matters?

A. Yes, sir.

Q. Will you describe in some detail the character of work which you have done for Ford, Bacon & Davis during this period of time?

A. Well, Ford, Bacon & Davis, Inc. is engaged principally in engineering and all its related subjects. In that Ford, Bacon & Davis has a special department known as the Valuation Department and Report Department in which is performed all manner and classes of investigation work, and principally engineering and industrial work in connection with merges, consolidations and their related financing, and all engineering in connection with pipe lines. They have built many of the long natural gas transmission lines in the country in which I was connected with it as the general field auditor. They have also been engaged in work for several of the natural gas companies other than the Colorado Interstate and the Canadian, and principally the East Ohio, Hope Natural Gas Company, and the United

Fuel Gas Co. All of these rate hearings and work in connection with rates I have been actively connected with since 1925.

Q. Were these companies that you have just mentioned listed correctly? Did you give the correct corporate names? Will you name them again and try to give them, please?

A. The East Ohio Gas Company, Hope Natural Gas Company, and the United Fuel Gas Co.

Q. And all of that work that you have just described involved accounting work?

A. Yes, sir.

Q. Did you have any contact with the accounting work in connection with the construction of the Colorado Interstate Gas Company?

A. No, sir.

Q. Or the Canadian River?

A. No, sir.

Q. Did you have any contact with the management of these companies by Ford, Bacon & Davis from an accounting standpoint?

A. I wouldn't say actively because when Ford, Bacon & Davis were acting as the managers of those two properties the monthly reports came in and frequently I would be called upon to analyze the monthly reports for presentation in a different form to the executives.

Q. Have you now described fairly and completely your accounting experience in connection with the activities of Ford, Bacon & Davis?

A. I think so, yes, sir.

(Vol. VI, pp. 747-751.)

* * * * *

Q. Now, with reference to Item 8 on Statement 2, which is headed "Adjustment for Items Charged to Expense which are Properly Capital," are those items the ones that covered by this memorandum which is referred to on Page 3 of the exhibit, being entitled "Items Charged to Expense on the books of the Colorado Interstate Gas Company during the period 1930 to 1939, inclusive, which should have been capitalized?

A. Yes, sir.

Q. You understand that that memorandum was furnished to the staff of the Federal Power Commission?

A. That was furnished in April of this year.

Q. Will you tell us just what you did in working out these adjustments as shown opposite Item 8 on Statement 2?

A. Well, I began with all of the maintenance and operation expense of the Colorado Interstate Gas Company. I had the assistance of practically six men in the Colorado Springs office of the Colorado Interstate Gas Company, and they assisted me, working there after hours. We set a program of four hours at night—from five o'clock until nine o'clock—and we worked approximately four weeks in putting together the data that is shown in that 400-page volume submitted to the Federal Power Commission, the summation of which is shown in Line 8 of this exhibit, Statement 2. In general they represent maintenance and operating expense items which according to my classification, should not have been expense but should have been capitalized.

Q. I take it that your investigation resulted in your finding only this amount of $284,806 as of the end of 1939?

A. That is accumulative, that $284,806. It represents the accumulation of $17,000 first shown in 1930 with accumulative additions each year.

Q. What were those items?

A. (Pause.)

Q. I don't mean for you to describe each one in detail, but can you give a general heading of them?

A. In general it consisted of the cathodic protection of the main line and laterals up to 1939. Subsequent to 1939 the expense of that particular operation is being capitalized.

Another large item is the rock-weighting of the main line itself. In other words, it was the placing of rock rip rap over the back fill of the pipe line to insure the line remaining down. From my own limited experience I have seen lots of lines under high pressures float.

Q. Is that when washouts occur?

A. That is when washouts occur, yes, sir, principally.

Q. And when you speak of the weighting, is that the placing of material on top of the pipe line?

A. The placing of rock on top of the back of it.

The Trial Examiner: That cost, Mr. Lusk, was charged to operating expense initially?

The Witness: Yes, sir.

By Mr. Dougherty:

Q. What other headings?

A. There is another item which amounts to quite a substantial sum and that is the rip rap and reinforcement of stream crossings to prevent soil erosion and washout of lines going across the streams. That has also been charged to expenses.

Q. Upon what basis or rule do you determine about these items that you have mentioned that they should properly have been capitalized and not charged to expense?

A. My reason principally behind that is that they are preventive and not corrective measures and therefore should not have been expensed.

Q. Did you have anything to do with the setting up of accounts of this company in the beginning in 1927 and 1928?

A. No, sir.

Q. Do you know whether or not any uniform system of accounts was used as a guide in the setting up of the books?

A. The companies, the Colorado Interstate Gas Company, used the Pennsylvania code in setting up their accounts.

Q. That is the code of accounts as in effect in the State of Penhsylvania for the public utilities for that time?

A. Not now. That was in effect in 1929.

Q. Was it in effect in 1927 and 1928?

A. I wouldn't say.

Q. Was the date 1920? Was that when it was adopted?

A. That was when the code itself became effective.

Mr. Dougherty: I am going to ask you not to answer the questions until I finish them. The reporter can't take both of us down at the same time.

The Trial Examiner: All that system of accounts, that was prescribed by the Pennsylvania Public Utilities Commission?

The Witness: Yes, sir.

By Mr. Dougherty:

Q. That is for Public Utilities in that state?

A. Companies within that state, yes

Q. Are you able to tell whether or not under that code of accounts these various adjustments for various items which you have found and charged to expense should properly be charged to capital?

A. May I refer to the code?

Q. Yes.

A. On Page 44 of the uniform classification of accounts for natural gas companies effective January 1, 1920, and issued by the Public Service Commission of the Commonwealth of Pennsylvania, in the paragraph under "Betterment," it states:

"Betterments are physical changes in structures or equipment, the object of which is to make the structures or equipment affected more useful or of greater capacity than they were at the time of their original installation or acquisition. The utility shall charge as a betterment to the appropriate sub-account of '101. Fixed capital installed since December 31, 1919' account that portion of the cost of such changes as will, when added to the original cost of the structures or equipment bettered, give the cost of the structures or equipment in their bettered condition."

Q. Under that particular provision which you have just read, is it your opinion that these adjusted items should have been charged to capital instead of expense?

A. I think so, yes. From my experience of long transmission pipe lines I am of the opinion they should have been capitalized and not have been charged under expense.

Q. Is it your opinion that whoever had to do with that in the company was in error in so charging it to expense?

A. I do.

Q. Now with respect to Item 9 on Statement 2, will you give us the explanation of how those adjustments were arrived at?

A. Taking the net property addition year by year I increased, or I included in Item 10, rather, six and a half per cent for corporate engineering and other administrative costs.

Q. Is that 10 or 9?

A. 9. It is Line 9.

I included six and a half per cent for engineering corporate and other administrative costs on all net property

additions year by year and in addition to the six and a half per cent I included one and a half per cent for interest on those net fixed capital additions. The six and a half per cent applies to the item "Expense" which should have been capitalized as shown by Line 8, but the one and a half per cent interest was not computed on the expense item.

Q. What was it computed on?

A. The interest was computed solely on the items of fixed capital added during the year.

Q. And those are the ones that are shown against Items 1 to 6?

A. That is right. They are incorporated in the total amounts shown by Item 1 to 6, inclusive.

Q. Were those interest items charged on the company's books?

A. No, sir.

Q. Why did you include them in this statement?

A. The Federal Power Commission code of accounts allows a nominal or reasonable amount, as they put it, of interest to be added to fixed capital when paid out of the company's own funds.

Q. Well, is that interest during construction?

A. As interest during construction.

Q. Are the computations you made in accordance with the provision of the Federal Power Commission code?

A. That is what I followed.

Q. I am speaking now with respect to the interest.

A. Yes, sir.

The Trial Examiner: The practice of the company during these years was to add interest during construction?

The Witness: No, sir, neither company has added interest during construction since the days of the initial construction period in 1928 regardless of the amount of additions and betterments they have put in.

By Mr. Dougherty:

Q. Does Item 10 show the original cost of all of the physical property and other properties of the Colorado Interstate Gas Company that you have described as being a portion of this Denver pipe line?

A. Line 10 is the total original cost of the Colorado In-

terstate Gas Company property devoted to the Denver pipe line.

Q. And then, Item No. 11, what is that?

A. Item 11 is the summation of Line 10 on Statement 1 and Line 14—Line 10 on Statement 2, and Line 14 on Statement 1. It is the total original cost of the Denver line's property owned by both companies combined.

Q. And in your opinion, is that a correct statement of the original cost as recorded on the company's books, together with the adjustments which you have made?

A. Yes, sir.

Q. So that, as I understand it, then, as of December 31, 1939, the original cost of these properties from Bivins station on the line north was $16,109,338?

A. That is correct.

(Vol. IX, pp. 1275-1282.)

Q. Now, Mr. Schutte, will you turn to that written statement and read it and as you read it, relate it to Exhibit 139?

A. "The written statement of Carl H. Schutte.

"This report sets forth the investment of Colorado Interstate Gas Company in gas plant, as of December 31, 1939. By account classification, it shows the value of that plant per the company's books, a series of adjustments made in journal entry form, and the gas plant investment after the application of the adjusting entries. It also shows components of cost of the several classes of plant.

"The adjusting entries, twenty-nine in number, running from No. 200 to No. 228, are given on Pages 1 to 48-D, inclusive. They are of two kinds: those that reclassify plant by transfers of amounts from one plant account to another, which entries are denoted by the letter 'R' prefixed to the numeral, and those that involve account other than plant accounts. The purpose of the entries is to adjust the plant accounts so that they will more nearly reflect the legitimate original cost of gas plant devoted to the public service. The explanation given as a part of each entry states the reason and basis for each adjustment.

"Following the journal entries on Page 49 appears Schedule No. 1. This tabulation shows by plant accounts, grouped according to the functions of the property they represent, the following: the investment per books as of December 31,

1939, the total amount of Examiner's debit and credit adjustments, the adjusted investment accounts as of December 31, 1939, and a list of amounts included in the adjusted investment accounts which are suspended for Commission's consideration. These elements are explainable as follows:

"(a) The investment per books is, with one exception, grouped according to the company's classification. We have classified that portion of the measuring system which relates directly to the sale of gas under distribution system.

"(b) The Examiner's adjustments are the total debits and credits for each plant account taken from a recapitulation of the twenty-six adjusting entries shown in Schedule No. 1A; the difference between total credit adjustments of $3,937,945.92 and total debit adjustments of $3,271,262.79, or $666,683.13, is charged to 'Other Accounts' (Cf. Schedule No. 1A, Column 13).

"(c) The adjusted plant investment (Schedule No. 1, Column 7), is the amount, subject to suspensions shown in Column 8, that is recommended to the Commission for acceptance as the original cost of the company's property.

"(d) The amount suspended for Commission's consideration, $492,547.30, consists of $32,079.71 paid to Standard Oil Company of New Jersey as commissions on purchases made for this company; a credit of $521.46 rebated on material purchased; and $460,989.05 paid to Ford, Bacon & Davis, Inc. for engineering fees and expenses. The reasons for the suspensions are given in entries Nos. 226, 227, and 228.

"Schedule No. 2, which supports transmission system plant, shown in Schedule No. 1, gives the transmission system costs for one main line and sixteen lateral lines. In turn, it is supported by Schedules Nos. 2A, 2B, 2C, and 2D, which show components of cost by four groupings: for main transmission lines, transmission system laterals, transmission system land, and transmission system rights of way, respectively. The components of cost are classified by items of property under each sub-account, analyzed to show labor, materials and miscellaneous, and overhead.

"Schedules Nos. 3 to 14, inclusive, and supporting sched-

ules show for the remaining parts of the transmission system, and for the distribution system, undistributed fixed capital general property, and franchises and contracts, the same type of information that Schedule No. 2 and its supporting schedules show for transmission system main line and laterals.

"Certain items under undistributed fixed capital call particularly for mention. Schedule No. 7, cost components of entrance rights of way, represents an amount of $350,000 paid to F. G. Bonfils, deceased, one time editor of the Denver Post (Cf. Report of Federal Trade Commission made in response to Senate Resolution No. 83, Seventieth Congress, Vol. 82, pp. 624-627).

"This transaction is described at length in the Examiner's Adjusting Entry No. 219.

"Schedule No. 10 and its supporting Schedules 10A, 10B, and 10C show the amount capitalized by the company for interest during construction, the basis of that capitalization, and a recalculation of interest during construction made by the Examiner for adjustment purposes.

"Except for initial construction in 1928 the company capitalized no interest during construction and the Examiner, following the company's policy in this request, has likewise made no allowance for interest during construction for plant constructed subsequent to the period of initial construction.

"Subsequent to the period of the company's initial construction substantial additions have been made, notably the Canon, Clayton, and Levine compressing stations have been built at a cost in excess of $1,600,000.

"Schedules 10, 10A, 10B, and 10C and adjusting entries Nos. 222 and 223, all of which cover interest during construction, are self-explanatory. Schedule 10D shows the allocation of undistributed fixed capital as adjusted by the Examiner to plant accounts.

"Schedule No. 14, an analysis of franchises and contracts, shows the nature of the $2,589,607.84 which makes up this account. The entire amount is the subject of adjustment by the Examiner in adjusting entries Nos. 224 and

225. Of the total, $2,352,941.47 is a write-up of the plant account made to offset the par value of the preferred stock and the recorded value of the common stock issued to associated companies; this amount has been transferred by the Examiner to gas plant adjustments. The remainder of the total, $236,666.57, representing the entire amount of the net recorded cost of the City of Colorado Springs contract, which is described in adjusting entry No. 225, has been transferred to other deferred debits. Further particulars of the amounts in the franchise and contracts account are quite fully set forth by Schedule No. 14 and adjusting entries Nos. 224 and 225.

"Schedule No. 16, four items of which are supported by Schedules Nos. 16A, 16B, 16C, and 16D; is an analysis of overheads and indirect field costs per the company's books as at December 31, 1939, amounting to $826,835.77. The major divisions of these overheads and costs are Ford, Bacon & Davis fees and expenses, purchase commissions, inspection services, taxes during construction, and indirect field costs, and the amount charged to each plant account is set forth in Columns 4 to 13, inclusive.

"For convenience the plant account schedule to which the figures in each of these columns relate is listed below:

Column of Schedule 16		
4	relates to Schedule	2-A—Columns 2 to 8 2-B—Columns 2 to 18
5	relates to Schedule	3-B—Column 6
6	relates to Schedule	3-C—Column 6
7	relates to Schedule	3-D—Column 4

9	relates to Schedule	5-C—Column 5
10	relates to Schedule	4-B—Column 5
11	relates to Schedule	4-C—Column 4
12	relates to Schedule	6—Column 2
13	relates to Schedule	11—Column 2"

Q. Mr. Schutte, the preparation of Exhibit No. 139, or, rather, in the preparation of Exhibit No. 139, did you have access to all of the accounting records available of the Colorado Interstate Gas Company?

A. Yes, sir, both at Colorado Springs and New York City.

Q. And at New York City?

A. Yes, sir.

Q. And this exhibit was prepared by you and under your direction and supervision?

A. The exhibit was prepared by me and the working papers in part were prepared by me and in part were prepared by my associates.

(Vol. XXXIV, pp. 4707-4713.)

* * * * *

CARL H. SCHUTTE called as a witness by and on behalf of the Federal Power Commission, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. March:

Q. By whom are your employed, Mr. Schutte?

A. By the Federal Power Commission.

Q. How long have you been in the employ of the Commission?

A. Since 1937.

Q. In what capacity?

A. First as examiner of accounts and now as principal examiner of accounts.

Q. What is your profession?

A. Accountant.

Q. I wonder if you would give us a brief history of your experience?

A. I'll be glad to.

The Trial Examiner: What is your full name, Mr. Schutte?

The Witness: Carl H. Schutte, S-c-h-u-t-t-e.

After completion of grammar school, I attended Gem City Business College at Quincy, Illinois. I later completed a course in accounting of Alexander Hamilton Institute and also certain portions of the higher accountancy course offered by LaSalle Extension University.

I have had twenty-seven years of practical experience in utility and other accounting, seventeen years of which was spent with public utility companies, both holding and operating companies, and three and one-half years with the Federal Power Commission as an Examiner of Accounts. Public utility experience commenced in the year 1913 in the consumers' accounting division of the Quincy Gas and Electric Company.

From 1914 to 1919 I was employed by the Southern Illinois Light and Power Company at Hillsboro, Illinois, and St. Louis, Missouri, first in the consumers' accounting division, next in the general accounting division, and for a period of about three years as assistant to the general auditor. The duties of this latter position were that of auditing and distributing expenditures for operation and property additions, as well as the immediate supervision of work performed by the accounting division.

From 1919 to 1923 I was employed as general auditor by Mexico Power Company and its successor, Missouri Utilities Company, the duties of which position were the supervision of all accounting matters of the company.

From 1923 to 1925 I was employed as general auditor by Community Power and Light Company, a holding company, owning and operating public utility properties. In this capacity my duties, among other things, consisted of supervision of all accounting matters, audits, and so forth, and included considerable work with public accountants in connection with audits and examinations concerning properties of which purchases were contemplated.

From 1925 through 1930 I was employed as general auditor and assistant secretary by Commonwealth Utilities Company, a holding company owning and operating public utility and other properties. In this capacity, my duties, among other things, consisted of supervision of all accounting matters, audits, and so forth, and included considerable work with public accountants in connection with audits and examinations concerning properties of which purchase was contemplated.

I was also a member of the Board of Directors of the

subsidiary companies owned or controlled by Commonwealth Utilities Company, in which capacity I acted as coordinator between the parent company and subsidiaries.

From 1930 to 1937 I was employed as an accountant in industrial work, resigning the position of general auditor with the New State Ice Company, Oklahoma City, Oklahoma just prior to my appointment to the staff of the Federal Power Commission in 1937.

By Mr. March:

Q. Have you made an examination of the books and records and accounts of the Canadian River Gas Company?

A. Yes.

Q. Where was that examination made?

A. The work that I personally did was at Colorado Springs and work was performed under my supervision at the office in New York City.

Q. Have you made an examination to ascertain the corporate history of the Canadian River Gas Company?

A. That's right.

Q. I wonder if you can just give us briefly the corporate history of that company?

A. All right, sir.

(Vol. VI, pp. 847-850.)

Exhibit No. 139

Docket G-124

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S ADJUSTING ENTRIES

Account Number		Debit	Credit
	No. 204		
250-11	Reserve for Depreciation - Transmission System	$1,673.59	
220-D	Transmission System Rights of Way (Main Line)		$1,673.59

The above amount represents the original cost of certain transmission system rights of way foreclosed upon by mortgagees, necessitating the repurchase of rights of way over such lands. The Respondent not only failed to remove such original right-of-way costs, but also capitalized the cost of repurchasing same, thus duplicating the cost of such rights of way in its plant account.

If proper provision had been made for the mortgagees' interests in acquiring these rights of way, there should have been no occasion for the loss of such rights of way and the necessity of repurchasing same. According to Mr. H. F. Benson, Respondent's Land Department representative, who was instrumental in the acquisition of rights of way, to have secured releases from all mortgagees (referring to the entire length of the pipe line) would have delayed acquisition of rights of way and delayed the construction of the pipe line.

Mr. Benson also said that it had been the Company's policy to secure releases only when the mortgagors were delinquent in payments due under mortgages and it appeared that foreclosure was probable, in which instances the payment made to the mortgagor for right-of-way grant was generally applied to the reduction of his mortgage.

This entry removes the costs of the ineffective rights of way from plant accounts. The original costs of the ineffective rights of way, together with costs of repurchase, are shown in the following schedule:

Docket G-124

Exhibit No. 139

8

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S ADJUSTING ENTRIES

No. R-206 (Cont'd)

To substitute Examiner's allocation (per debits above) of the following initial construction overheads, in lieu of the Company's allocation thereof (per credits above) as recorded by its Vouchers M-206 and M-210, December 1928:

Account Number		Amount
258	Ford, Bacon & Davis, Inc. Fees and Expenses	$370,248.89
258	Engineering and Superintendence during Construction	15,792.52
259	General Office Clerks' Salaries during Construction	17,956.36
260	General Officers' and Clerks' Expenses during Construction	8,882.24
261	Office Supplies and Expenses during Construction	7,982.88
263	Injuries and Damages during Construction	123.58
264	Insurance during Construction	6,632.98
265	Taxes during Construction	44,361.99
267	Other Expenditures during Construction	977.32
	Total initial construction overheads allocated by Vouchers M-206 and M-210, 1928	$472,958.76
	Less: Overheads charged to Account 223-C, Canon Building No. 14 (well house) subsequently retired	6.59
	Initial construction overheads subject to reallocation	$472,952.17

The base used by the Company in its allocation omitted Accounts 220-D, Transmission System Rights of Way; 226-D, Transmission System Equipment, River Crossings; and 255-E, Telephone System.

The Company's allocation within the Transmission System Equipment account was based on the mileage of the several lines regardless of the size of pipe, rather than the dollar cost of the individual lines. Due to this method of allocation, the overheads assigned to the several laterals are inequitable.

This entry reallocates such initial construction overheads over all plant accounts as of November 30, 1928 to which they are applicable based on the ratio of the individual plant account to the total investment.

To remove from plant accounts excess Taxes during Construction capitalized by Vouchers L-254 and M-175 in 1928. Total taxes for the year 1928 as shown by Schedule No. 16-D were $59,149.33, of which $44,361.99, the proportionate amount for the 9-month period ended September 30, 1928, was capitalized and $14,787.33, the proportionate amount for the months of October, November and December, was expensed.

In view of the fact that commercial deliveries of natural gas were made to Colorado Fuel and Iron Company located near Pueblo, Colorado, on June 19, 1928, to Pueblo Gas and Fuel Company on June 21, 1928, and to the Public Service Company of Colorado at Denver, Colorado, on June 23, 1928, the period covered by taxes capitalized, January 1 to September 30, 1928, extends beyond a reasonable date for the commencement of commercial operation, the reasonable date for which appears to be July 1, 1928.

Removal by this entry of $14,787.33 of taxes capitalized for the period July 1 to September 30, 1928 leaves $29,574.66 of taxes in the plant accounts for the 6-month period ended June 30, 1928.

	Miscellaneous Income		10,233.36
		$10,325.63	$10,325.63

To adjust the Company's entry by Voucher F-12, June 1933, covering the sale of the Clayton Lateral and meter station as of May 31, 1933 to Canadian River Gas Company. Depreciation reserves in connection therewith are covered by Examiner's Adjusting Entry No.

The differences between Respondent's recorded costs for this property and Examiner's adjusted costs are due to the Respondent's having erroneously allocated its initial construction overheads as recorded by its Vouchers M-206 and M-210, December 1928, first, by omission of several plant accounts in the base on which the allocation was computed, and second, because the allocation of such overheads within the transmission system was based on the mileage of the several lines rather than on the dollar cost thereof, thus inevitably charging to the Clayton Lateral (2-, 3- and 4-inch pipe) the same rate per mile as was charged the main line and other laterals of larger size.

The allocation of the initial construction overheads is adjusted by Examiner's Adjusting Entry No. R-206 which, together with Examiner's Adjusting Entries Nos. 207 and R-208, results in a net adjustment in the cost of the property disposed of to Canadian River Gas Company as above.

Following is a reconciliation of the cost of such property, per books, adjustments applied, and as adjusted by the Examiner:

Account Number	Description	Cost Per Books May 31, 1933	Cost As Adjusted May 31, 1933	Entry No. 209 Adjustment

	Compressing Station Equipment - Canon:		
224-28C	Transmission Water Line (Purgatoire River)		16,626.12
224-20C	General Construction		1,784.07

To transfer the recorded costs of the above items as of December 31, 1939, plus the proportion of General Construction Costs (Account 224-20C) as are applicable to the Transmission Water Line, Purgatoire River (Account 224-28C), from Gas Plant in Service to Gas Plant Held for Future Use, all in accordance with data acquired in the Engineering investigation as outlined in the attached memorandum.

The amount transferred from General Construction Costs, Account 224-20C, represents the proportion of that account applicable to costs recorded in Account 224-28C, Transmission Water Line, Purgatoire River, and is computed as follows:

	Direct Costs to Which Applicable	General Const. Costs Applied
Transfer in 1932 of costs from Work Order No. 41, originally recorded in Account 224-8C by Voucher J-420, 1930	$ 2,743.22	$ 587.77
From closing Work Order No. 134, by Voucher M-43, 1932	13,240.53	1,196.30
Total General Construction Costs applicable		$1,784.07

COPY

No. 214 (Cont'd)

M E M O R A N D U M

Colorado Springs, Colorado
August 15, 1940

Subject: Colorado Interstate Gas Company
Recommended Adjustment in Plant Accounts

At the time of our inspection of Canon Compressing Station in August 1939, it was found that the Purgatoire River pump house, pumping equipment installed therein, and the water line from the river up to the compressing station site were not in use. It was also observed that a dam, which had been constructed across the river downstream from the suction water line, had been washed away.

Information subsequently obtained from examination of company records, and from conversation with the Chief Engineer of the company and the Chief Engineer of Canon Station is summarized as follows:

(1) Due to inadequacy of water supply from wells located on the compressing station site, in 1932 the company built a dam across the Purgatoire River, installed a gas-engine driven pump in a Butler steel building near the dam and a 4" steel water line from the pump house to the station site.

(2) The major portion of the water supply for compressing station use was obtained from the river from 1932 to 1937, although this source was not too satisfactory, because the river water was very hard, and the dam was seriously damaged by floods from time to time.

(3) In 1937, the company obtained a new supply of much softer water from the Arnet wells, which it drilled on a leasehold approximately four miles from the station site. These wells are now the normal source of supply for all plant uses.

(4) The river dam has washed away and costs were retired by the company in 1939. However, the pump house, pumping equipment and water line are still in place and are still on the company books, although not maintained in the same condition as other property at the station. The company thinks that the Arnet wells will continue to deliver an adequate supply of water, but is not certain of it, and has therefore kept the Purgatoire River water supply system in place so that it can be put in operative condition and used if the Arnet wells go dry or become inadequate.

(5) The Purgatoire River water supply system cannot be used for regular or emergency service in its present condition and hence, in our opinion, should not be classified as plant in service. However, the company's past difficulties in securing an adequate supply of water for Canon Station indicate that there is a possibility that the Purgatoire River water supply system may have to be put back in service at some future date, particularly if the Arnet wells go dry or become inadequate, and hence, we recommend that the company's investment in this property as of December 31, 1939 be classified as plant held for future use.

/s/ L. M. Hill
L. M. Hill

		$ 291.26	$ 135.72	$ 155.54
Labor	$1,844.23			
Trucking	792.73			
Miscellaneous - auto expenses, etc.	91.32	2,728.28	1,084.70	1,643.58
Totals - charged on Voucher M-39, December 1935		$3,019.54	$1,220.42	$1,799.12

Following is a copy of memorandum concerning the recording of the costs of Work Order No. 198:

"COLORADO INTERSTATE GAS COMPANY
Colorado Springs, Colo.
1/17/36

"J. O. Shields

Dear Mr. Shields:

"Work Order No. 198, issued for the reconditioning of the main gas piping at Devine Station, indicates upon analysis that part of the cost of this job should be charged to investment, due to the fact that we excavated the old corrosive soil overlying the pipe - removing it entirely and replacing it by the purchase in Pueblo of fine gravel and sand out of Fountain Creek.

"The total cost of the job was $3,019.54 of which $1,799.12 should be charged to expense and $1,220.42 should be charged to investment.

Yours very truly,

/s/ J. P. McClintock"

The above amount of $1,220.42, capitalized by the Respondent, is transferred to Operating Expenses for the reason that the type of expenses incurred in connection with the work performed under Work Order No. 198, as well as the title of the work order and the above copy of memorandum, indicates the character of work as being in the nature of preventive maintenance rather than an addition to the physical plant.

It also appears that the cost of labor and trucking capitalized is the result of an allocation.

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S ADJUSTING ENTRIES

No. 217 (Cont'd)

The above total amount, $667.79, is transferred to Operating Expenses for the reason that the expense incurred appears to be maintenance of the several houses, rather than additions thereto.

Following is a copy of Examiner's letter concerning the propriety of capitalizing the costs of this work order, which inquiry remains unanswered:

"Colorado Springs, Colorado
June 7, 1940

"Mr. J. O. Shields, Assistant Treasurer,
Colorado Interstate Gas Company,
Colorado Springs, Colorado.

Dear Sir:

"The entire cost of Work Order No. 343, $667.79, was charged to Fixed Capital Account No. 223 C, Devine Station, houses numbers 1-2-3-4-9-11 and 12, by Voucher H-34, 1939.

"According to the record the work covered by this work order consisted of screening six houses, numbers 2-3-4-9-11 and 12 $ 208.16
remodeling back porches of houses 1-2 and 9 431.47
painting front porches of houses 2-3-4-9-11 and 12 14.08
painting back porches of houses 1-2 and 9 14.08
$ 667.79

"Inasmuch as these houses were erected some years ago, please advise whether this screening is the first screening of these houses, also the character of the remodeling, and the reason for capitalizing the cost of remodeling and painting the porches.

Yours very truly,

E. L. Dunn,
Examiner of Accounts."

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S ADJUSTING ENTRIES

Account Number		Debit	Credit
	No. 220		
146	Other Deferred Debits	$26,750.00	
203	Other Expenses during Construction		$26,750.00

The above amount, paid by New York Office Voucher 361 (1928) to Henry L. Doherty & Company, and recorded on the records at the Colorado Springs, Colorado office by Voucher H-459 (August 1928), represents a payment to Cities Service Company in June 1928 and is indicated as being the repayment of an advance of $25,000.00 "made by Cities Service Company in connection with the Denver franchise," together with interest thereon at the rate of 6% per annum for 14 months amounting to $1,750.00, or a total of $26,750.00.

The vouchers by which the above item was paid and recorded on the Respondent's Colorado Springs, Colorado records were considered to be inadequately supported in that there were no details regarding the date, purpose or nature of the $25,000.00 advance. In response to Examiner's inquiry of March 30, 1940, Mr. J. O. Shields, Assistant Treasurer, Colorado Interstate Gas Company, replied by letter dated April 18, 1940, as follows:

"With reference to your letter of March 30, 1940, to Mr. P. C. Spencer, I wish to advise that the amount of $26,750.00 paid to Cities Service Company was on account of engineers and other employees in connection with the initial acquisition of the rate ordinance and other matters investigating the feasibility of the gas supply for Denver. We have no knowledge of the exact date on which the various services were performed.

"The amount was an amount agreed to in conference and was approved by Mr. Payne on the face of the bill as a result of that conference. The reason for deferring payment was that the question did not come up until approximately the time of settlement when the Cities Service Company made the request. The interest was included because repayment had been deferred and was decided upon as part of the settlement of the charge."

The explanation of the disbursement given by Mr. Shields as above, and the statement rendered by Cities Service Company, both state that the charge was in connection with the Denver franchise.

The total amount of this disbursement is therefore transferred to Other Deferred Debits by the Examiner, for the reason that the information contained in the letter reproduced above is indefinite as to the type of services rendered and does not show conclusively that the costs of such services as were rendered are legitimate plant costs of the Respondent, particularly since the Denver franchise is held by the Public Service Company of Colorado and not by the Respondent, for which reason it is believed inequitable for the Respondent to absorb in its plant accounts expenses incurred in connection with such franchise, either by or for the account of the holder thereof; and for the additional reason that the amount of the disbursement appears to be the result of negotiations between the parties involved, rather than the actual cost of services rendered.

For the above-stated reasons this amount has been removed from the plant accounts and charged to Other Deferred Debits for the Commission's determination as to the disposition thereof.

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S ADJUSTING ENTRIES

Account Number		Debit	Credit
	No. 222		
535	Other Interest Charges (1928)	$183,315.48	
534.2	Other Interest Revenues (1928)		$ 2,448.49
266	Interest during Construction (1928)		180,866.99

The Respondent capitalized as Interest during Construction an amount computed as follows:

October 1928 - Interest charged by Standard Oil Company (New Jersey) to September 30, 1928 on advances made for construction purposes for both Colorado Interstate Gas Company and Canadian River Gas Company (Per details, Schedule No. 10, Part 1)	$447,400.55	
Less, Amount charged to Canadian River Gas Company	265,754.56	
Amount absorbed by Colorado Interstate Gas Company		$181,645.99
December 1928 - Interest charged by Interstate Natural Gas Company on expenditures for the account of Ford, Bacon & Davis, Inc. from June 6 to September 30, 1927, and on advances for Benson Special Account from September 30 to December 16, 1927, and Womble Special Account from November 30 to December 16, 1927	$2,225.99	
Less, Amount charged to Canadian River Gas Company (one-fourth)	556.50	
Amount absorbed by Colorado Interstate Gas Company		1,669.49
Total charges		$183,315.48
Less, Amounts credited to Interest during Construction:		
October 1928 - Charge to Canadian River Gas Company for interest on advances during September 1928	$ 271.94	
October 1929 - Correction of error in transferring interest from Ford, Bacon & Davis, Inc. books per Voucher H-332, 1928. It was then credited to Interest Revenue account, whereas it should have been credited to Interest during Construction. Analysis thereof is shown in Schedule No. 10, Part 1	2,176.55	2,448.49
Net amount of Interest during Construction capitalized (Note 1)		$180,866.99

The interest capitalized therefore represents primarily interest on funds advanced by Standard Oil Company (New Jersey) computed from the date of the advance to September 30, 1928, irrespective of the amounts, and periods such funds were actually used for construction purposes.

It is found that while interest on advances, etc., was capitalized to September 30, 1928, the pipe line was placed in commercial operation prior to that date, the first deliveries of natural gas having been made as follows:

To Colorado Fuel and Iron Company on June 19, 1928
To Pueblo Gas and Fuel Company on June 21, 1928
To Public Service Company of Colorado at Denver, Colorado, on June 23, 1928

The entire amount of $180,866.99 of Interest during Construction as charged which is related to funds borrowed rather than computed on direct construction expenditures during the construction period, is therefore removed from the plant account and the amount substituted in lieu thereof, as the result of Examiner's recalculation, is presented in the following Entry No. 223.

Note: (1) The Company has not capitalized Interest during Construction

Exhibit No. 139

Docket G-124

38

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S ADJUSTING ENTRIES

Account Number		Debit	Credit
	No. 223		
266	Interest during Construction	$191,901.80	
536	Interest Charged to Construction		$191,901.80

To record Examiner's computation of Interest during Construction based on actual construction expenditures to July 1, 1928, which date is considered as being the reasonable date for commencement of commercial operations in consideration of Respondent's having made the first substantial deliveries of natural gas during June 1928, as set out in the preceding entry.

Details of the Examiner's computation are presented in Schedule No. 10-C.

COLORADO INTERSTATE GAS COMPANY
ACCOUNTANT'S ADJUSTING ENTRIES

Account Number		Debit	Credit
	No. 224		
107	Gas Plant Adjustments	$2,352,941.17	
	Franchises and Contracts		$2,352,941.17

The above amount represents the recorded value of capital stocks issued as follows:

To Southwestern Development Company:	
10,000 shares of 6% preferred stock of $100.00 par value each	$1,000,000.00
531,250 shares of no-par value common stock	1,000,000.00
Total stock issued to Southwestern Development Company	$2,000,000.00
To Cities Service Company:	
187,500 shares of no-par value common stock	352,941.17
Total stocks charged to Franchises and Contracts	$2,352,941.17

Copy of the resolutions adopted by the Board of Directors on June 5, 1928, authorizing the issuance of these stocks, is attached.

For the following reasons the entire amount of $2,352,941.17 is considered a write-up of the plant account to offset the par value of the preferred stock and the recorded value of the common stock issued to associated companies:

(1) Apparently no tangible consideration was received by the Respondent for the above stocks issued, and the intangible value, if any, of the consideration received by the Respondent appears questionable. According to the minutes of the Board of Directors at a meeting held June 5, 1928, Canadian River Gas Company refused to enter into a contract under the terms of which the gas supply of the Respondent was to be purchased from Canadian River Gas Company, unless the Respondent should issue to it or its order as part consideration therefor the stocks shown above as being issued to Southwestern Development Company. The latter company at that time owned, and has continuously owned since that time, 100% of the capital stock of Canadian River Gas Company. Also on June 5, 1928, the Board of Directors of Colorado Interstate Gas Company, in order to make contracts for the sale of gas to Pueblo Gas and Fuel Company and Public Service Company of Colorado, both of which companies were owned or controlled by Cities Service Company, authorized the issuance of 187,500 shares of the Respondent's common stock to Cities Service Company. It therefore appears that the Respondent gave common and preferred stocks at a recorded value of $2,000,000.00 for the right to buy gas, and gave common stock at a recorded value of $352,941.17 for the privilege of selling gas to certain customers. The value, if any, to be placed upon these privileges is referred to the Commission for determination.

(2) The minutes of the Board of Directors do not contain any authorization for the value at which the 718,750 shares of no-par common stock were to be recorded. The price of $1.88235294 per share is the same as that which was paid by Standard Oil Company (New Jersey) for 531,250 shares of no-par common stock purchased by it.

Excerpts from Minutes of the Board of Directors' Meeting
Held June 5, 1928

COPY

WHEREAS, The officers of this corporation have negotiated the purchase by this corporation from the Canadian River Gas Company of certain gas to supply customers of this corporation in and near Denver, Pueblo and Colorado Springs, Colorado, and elsewhere along and near the pipe line which this corporation contemplates constructing from near Clayton, New Mexico, to Denver, Colorado, with branches to Pueblo, Colorado Springs, Concrete and Portland, Colorado, and upon the election of this corporation the gas required by it to supply any other customers which it may have, in the amounts, for the price or prices, and under the terms and conditions specified in a certain proposed agreement bearing date the third day of January 1928, submitted to and read at this meeting; and

WHEREAS, Said Canadian River Gas Company has refused to enter into said contract unless this corporation shall issue to it or to its order as part consideration therefor Ten Thousand (10,000) shares of its One Hundred Dollar ($100.00) par value, Six Per Cent. (6%) Preferred Capital Stock and Five Hundred Thirty-one Thousand Two Hundred Fifty (531,250) shares of its Common Capital Stock, and

WHEREAS, It is deemed to be to the best interests of this Corporation to enter into and perform said contract and pay the consideration therefor;

NOW, THEREFORE, BE IT RESOLVED, That the President or any Vice-President of this corporation be and he is hereby authorized to execute with the Canadian River Gas Company the contract in the form presented to and read at this meeting, and the Secretary or any Assistant Secretary of this corporation be and he is hereby authorized and directed to affix thereunto and attest the corporate seal of this corporation; and

FURTHER RESOLVED, That the officers be and they are hereby authorized to issue to the Canadian River Gas Company or to its order Ten Thousand (10,000) shares of the One Hundred Dollar ($100.00) par value, Six Per Cent. (6%) Preferred Capital Stock of this corporation and Five Hundred Thirty-one Thousand Two Hundred Fifty (531,250) shares of the Common Capital Stock of this corporation as part of the consideration for the Canadian River Gas Company entering into said contract with this corporation; and

FURTHER RESOLVED, That the officers of this corporation be and they are hereby directed to do all things necessary or proper to perform said contract in accordance with the terms thereof.

On motion, duly made and seconded, the following Resolution was unanimously adopted:

WHEREAS, This corporation has requested the Public Service Company of Colorado and the Pueblo Gas & Fuel Company, owned or controlled by the Cities Service Company, to enter into contracts with it for the sale of gas to said companies as provided in said contracts; and

WHEREAS, The Cities Service Company has declined and refused to permit or direct its said subsidiaries to enter into such contracts unless there is issued to it One Hundred Eighty-seven Thousand Five Hundred (187,500) shares of the Common Capital Stock of this corporation; and

WHEREAS, It is to the best interests of this corporation to negotiate the sale of gas to said subsidiaries of the Cities Service Company, under the terms set forth in said contracts, and to issue to the Cities Service Company One Hundred Eighty-seven Thousand Five Hundred (187,500) shares of the Common Capital Stock of this corporation;

NOW, THEREFORE, BE IT RESOLVED, That One Hundred Eighty-seven Thousand Five Hundred (187,500) shares of the Common Capital Stock of this corporation be issued to the Cities Service Company in consideration for its directing its said subsidiary companies to enter into, with this

Exhibit No. 139

Docket G-124

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S ADJUSTING ENTRIES

Account Number		Debit	Credit
	No. 225		
146	Other Deferred Debits	$236,666.67	
	Franchises and Contracts		$236,666.67

The above amount represents the net recorded cost of the contract with the City of Colorado Springs, Colorado, and consists of:

(1) Payment of $275,000.00 in July 1931 to Guaranty Trust Company, New York City, to be held in escrow for Mr. Arthur K. Lee pending completion of certain formalities, as the consideration for the assignment per agreement of June 5, 1931 between R. J. Dunham and W. D. Pratt (assignors) and Ford, Bacon & Davis, Inc. (assignees) of:

(A) Franchises from the towns of Sugar City, Ordway, Fountain, Crowley, Olney Springs, Fowler, Manzanola, and South Canon, all in Colorado;

(B) Contract dated July 30, 1930, between the City of Colorado Springs, Colorado, and Arthur K. Lee;

(C) Deposits made in connection with franchises and contracts:

$25,000.00 with Colorado Springs
15,000.00 with Ordway
5,000.00 with Sugar City
5,000.00 with Fountain

(D) All the capital stock of the Canon City Gas Company.

(2) Credit of $25,000.00 arising from the recovery in full by Respondent, of the deposit with the City of Colorado Springs.

(3) Credit of $13,333.33 arising from the recovery of two-thirds of the deposits with Ordway and Sugar City. This amount appears to have been collected by Ford, Bacon & Davis, Inc. and passed along by them to the Respondent in March 1932. According to a letter dated February 27, 1940 from Mr. J. O. Shields, Assistant Treasurer of Colorado Interstate Gas Company, the above represented two-thirds of the cost of the franchises, the other one-third being retained by the towns, and the $5,000.00 deposit with Fountain was forfeited because no terms could be agreed upon. Mr. Shields also advised that no record was found of the capital stock of the Canon City Gas Company but he believes that it had no value at any time.

No. 225 (Cont'd)

In response to inquiries made by the Examiner, Mr. John L. Rice, Town Clerk, Ordway, Colorado, advised that a natural gas franchise dated October 6, 1930 was granted to Arthur K. Lee interests; that the $15,000.00 deposit made was to insure compliance with the ordinance; that the Lee interest therein was apparently transferred to Arkansas Valley Natural Gas Company, and on October 5, 1931 a new ordinance was prepared; that $10,000.00 of the deposit was refunded to Arkansas Valley Natural Gas Company, receipt thereof being acknowledged on December 28, 1931; and that $5,000.00 of the deposit appears to have been retained as a forfeiture because of change or failure on the part of the depositors to comply with the original agreement.

Mr. A. M. Sayers, Town Clerk, Fountain, Colorado, advised that a natural gas franchise dated October 24, 1930 was granted to Arthur K. Lee and subsequently assigned to Arkansas Valley Natural Gas Company (date unknown); and that the $5,000.00 deposit was required to guarantee fulfillment of the terms of the franchise and was forfeited because the assignee would not carry out the terms of the franchise but wanted higher rates for gas.

Examiner's inquiry addressed to the Town Clerk of Sugar City, Colorado, was unanswered.

None of the eight communities, the franchises of which were assigned under the terms of the agreement of June 5, 1931, is served directly by the Respondent. The towns of Sugar City, Ordway, Fowler and Manzanola are served by Arkansas Valley Natural Gas Company, which company is understood to be controlled by Ford, Bacon & Davis, Inc.

The entire amount of the net recorded cost of the City of Colorado Springs, Colorado, contract, $236,666.67, has been removed from the plant account and charged to Other Deferred Debits for the Commission's determination as to the disposition thereof, for the following reasons:

(1) The recorded cost includes $11,666.67 representing unrecovered deposits, which should have been disposed of at the time the deposits were determined to be uncollectible.

(2) The payment of $275,000.00 to Mr. Lee covered franchises in eight communities as well as the contract with the City of Colorado Springs. It therefore appears that some allocation of the payment should have been made as between franchise and contract costs for the nine towns and cities involved.

(3) Gas service to four of the communities from which franchises were received was instituted by Arkansas Valley Natural Gas Company shortly after the date the franchises were acquired by the Respondent. It therefore appears that the Respondent gave these four franchises to Arkansas Valley Natural Gas Company free of charge.

(4) The contract to sell gas to the City of Colorado Springs did not cost Mr. Lee anything. It is clearly understood that the city was negotiating for favorable rates and required no payment, except the deposit of $25,000.00 to guarantee performance of the contract. By reimbursing the Lee interests for whatever expenditures they may have made in connection with the acquisition of the franchises and contracts and for preliminary work in connection with their proposed pipe line, plus a possible promoter's profit, Colorado Interstate Gas Company was able to acquire the Lee contract and thereby remove the possibility of a competitive pipe line in the vicinity of its own pipe line.

CANADIAN RIVER GAS COMPANY, a corporation, PETITIONER,

vs.

FEDERAL POWER COMMISSION; CITY AND COUNTY OF DENVER, COLORADO; PUBLIC SERVICE COMMISSION OF WYOMING; COLORADO-WYOMING GAS COMPANY; PUBLIC SERVICE COMPANY OF COLORADO; and COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

ON PETITION TO REVIEW AND SET ASIDE ORDERS OF THE FEDERAL POWER COMMISSION.

FILED SEPTEMBER 9, 1942.

VOLUME 3—Pages 1231-1820

[Testimony of CARL H. SCHUTTE, continued.]

By Mr. Lange:

Q. Mr. Schutte, you have heretofore testified in connection with exhibits prepared and submitted in this proceeding?

A. Yes, sir.

Q. I will ask you whether you have also had occasion to examine Exhibit No. 67 that was prepared by Mr. William A. Lusk and heretofore identified in this proceeding, in evidence?

A. Yes, sir.

Q. In connection with that exhibit I will ask you whether you have examined Statement 2 of that exhibit of Mr. Lusk which is described as original cost of Denver pipeline properties at December 31, 1920 to 1939, inclusive?

A. Yes, sir, I did.

Q. Did you find any difference between the amounts shown on that statement and those on the books of the company as of December 31, 1939?

A. In so far as the plant account is concerned, yes, sir.

Q. What was that difference?

A. The difference is $14,334.51.

Q. And what did that consist of?

A. In the transmission groups of accounts, which is Item 1 of Statement 2 of Exhibit 67, Mr. Lusk included the cost of five farms that are owned by the Colorado Interstate Gas Company and which are carried on its books and financial statements as other physical property. The cost of those farms at December 31, 1939 was $14,334.51 and the company's statement shows them in the category of an investment other than its investment in pipe line facilities.

Q. Now, what do those items describe, as in the company's books?

A. The company describes them as Anderson farm, Castle farm, Gaumer farm, the Green farm and the Jones farm.

Q. Do you have any record as to the time of acquisition of those properties per the company's books?

A. Yes, sir. Ford, Bacon & Davis purchased right of way easements prior to and during the construction of the pipe line from the owners of each of these farms. They did not, however, obtain appropriate releases in connection with the mortgages when they acquired those rights of way

or easements. When the right of way over the Anderson farm was purchased in November 1927 the taxes for that year had not been paid, and in 1932 when the tract was sold for unpaid taxes the 1927 tax item was senior to the right of way easement acquired and the sale of the property at public auction and the purchase thereof by other interests would have made the original right of way purchased ineffective.

To protect its right of way across this tract, the company purchased the farm at the tax sale. The Castle, Gaumer, Green and Jones farms were purchased at mortgage foreclosure sales. Due to the fact that the mortgages were senior to the right of way easements acquired and because no releases had been secured when the easements were acquired, the sale of these farms to other interests at a foreclosure would have made those rights of way ineffective.

I think I mentioned once before that Mr. Benson advised us that it had not been the company's policy to acquire releases in cases of mortgages except when it appeared that the mortgage was likely to be foreclosed upon and in those instances where they would secure the necessary releases the payments in such cases were usually applied, with the consent of the mortgagor, as a payment on the mortgage itself.

Q. What Mr. Benson did you have reference to?

A. H. F. Benson, the company's land representative. There were two mortgages on the Castle farm. The first mortgage was held by the Federal Land Bank of Wichita and a second mortgage by Nathan L. and Raymond A. Wheeler.

The holders of the second mortgage foreclosed and the company purchased the property. When the first mortgage became due the company paid that. The cost of the Castle farm includes 26 shares of the capital stock of the Bessemer Irrigating Ditch Company. According to information received from that company its capital stock has a market value of at least $75 per share. Therefore, the 26 shares acquired with the Castle farm have a market value of at least $1950, which, however, has not been segregated from the cost of the farm itself.

The Gaumer, Green and Jones farms were purchased from the public trustee of Las Animas County, Colorado at mortgage foreclosure sales. The same situation holds true there as to releases.

Q. What reason, if any, do you have for not including those—for not recognizing those as properly includable in the original cost as of December 31, 1939?

A. Well, the company had already acquired rights of way over the five farms prior to or during construction period and the costs of those rights of way have been and are still included in the appropriate plant accounts.

To, therefore, include any portion of the farm cost in addition to the costs of such rights of way results in duplication of that particular right of way cost; then, too, these tracts, the area of which is shown on the—well, in an exhibit I have prepared there—are not now and never have been in their entirety devoted to the operation of the company's pipe line facilities, and only that portion of each of the farms as is used for right of way is essential for gas operations.

The Federal Power Commission's Uniform System of Accounts under instructions, gas plant account, Page 44, Item 9, under land and land rights, says:

"The cost of land and land rights acquired in excess of that used in gas operation, shall be included in Account 110, Other Physical Property, or Account 100.4, Gas Plant Held for Future Use, as appropriate."

Section "J" of that particular section states:

"When the purchase of land for gas operations requires the purchase of land not used for such purposes the charge to the specific land account shall be based upon the estimated cost of only that portion which is used for gas operations. The cost of the remaining land shall be included in Account 100.4, Gas Plant Held for Future Use, or 110, Other Physical Property, as Appropriate."

The company has consistently shown the cost of these farms as other physical property and has excluded that amount from its plant account in its statements and on its books, and the tracts in their entirety are not devoted to or

necessary for the operation of the company's pipe line facilities, which is evidenced by the fact that the titles to the five farms as at December 31, 1939 in the names of E. S. Hall, to facilitate the transfer of the properties if an opportunity to sell the farms occurs.

In discussing these items with Mr. H. F. Benson the company's land representative, he told us that a few years ago the United States Government offered to buy the Gaumer and Jones farms which are located in the so-called Colorado Dust Bowl area in connection with reclamation work. The company agreed to sell these farms at the Government price, but because funds for the project were exhausted, the farms were not purchased and are still retained by the company.

Q. You just referred to the fact that you had prepared a compilation making a comparison of costs in connection with these farms. This is the comparative statement you have reference to?

A. Yes, sir.

Mr. Lange: Will the stenographer please mark that for identification?

The Trial Examiner: It will be marked for identification as Exhibit No. 195.

(Exhibit 195, Witness Schutte, marked for identification.)

The Witness: That purports to be a comparison of original cost of the Denver pipe line properties as of December 31, 1939, per company books, with Exhibit No. 67 introduced by Mr. William A. Lusk.

By Mr. Lange:

Q. That is the same exhibit you were just referring to a while ago?

A. Yes, sir.

Q. Now what are the differences that you noted in connection with the Statement 2 of Mr. Lusk's Exhibit 67, particularly items 1 to 7 of that statement?

A. In preparing Statement 2 of Exhibit 67, Mr. Lusk made an allocation of the previously undistributed construction items. This allocation covered other expenses

during construction, $63,675.61; law expenditures during construction, $50,899.41; and interest during construction, $180,866.99, or a total of 295,442.01.

Mr. Spencer: You referred to items 1 to 7 and I am not following you as to what items you are talking about.

The Witness: Exhibit 67.

Mr. Lange: Of Exhibit 67, Statement 2, Mr. Spencer.

Mr Spencer: I see. All right. Excuse me.

The Witness: One item of undistributed construction costs on the books which is rights of-way, in the amount of $350,000 was omitted from the statement—from Mr. Lusk's Exhibit No. 67. Mr. Lusk allocated the items aggregating $295,442.01 to the functional groups rather than to the individual primary accounts, using as a basis the ratio of the total of such undistributed amounts to the direct construction costs as of December 31, 1928, which resulted in the addition to each of the functional groups—functional group figures at December 31, 1928 of 3.4839086 per cent, of the direct costs as undistributed construction expenditures. The allocation of the undistributed construction costs and the application thereof to the book costs as of December 31, 1939 is shown in Statement No. 1 of Exhibit 195 just introduced.

Mr. Spencer: 1-A, you mean, Mr. Schutte?

The Witness: No. 1, Mr. Spencer. In Column 3 is where he makes his allocation.

Mr. Spencer: I see.

The Witness: Which also shows the comparison of the original cost per books adjusted to reflect the inclusion of the undistributed construction costs to functional groups with the amounts for comparable accounts per statement 2 of Exhibit 67.

I agree with Mr. Lusk that the method used for allocation of previously undistributed construction costs is an equitable method of distribution. However, there has been some retirement of property included in the December 31, 1928 investment base to which a proportionate part of the

undistributed construction expenditures should have been applied in recording such retirements. This has been overlooked both as to the company books and in the preparation of Statement 2 of Exhibit 67.

By Mr. Lange:

Q. Well, then, in your opinion how much of those undistributed construction costs should have been retired?

A. Based on the retirements in the transmission system other structures and equipment, telephone system, office furniture and equipment, tools and equipment, and all of the garage equipment, that was in the fixed property account at December 31, 1928, approximately $4,000. This amount of course is subject to adjustment based on the use of the individual primary accounts, as of December 31, 1928, as a basis for the allocation of the previously undistributed construction costs.

The amounts of each of the primary accounts were not available in Mr. Lusk's working papers, he having prepared his statement on functional group rather than on an individual primary account basis.

The total amount of the undistributed construction costs allocated as well as the portion thereof subject to retirement is subject to adjustment based on the Commission's determination as to the inclusion of all of the claimed original costs, whether direct or otherwise.

Q. Now, do you limit these exceptions that you have taken to the statements in No. 2 of Mr. Lusk's Exhibit 67, or are they also applicable to any other exhibits in your opinion?

A. They represent only exceptions taken to the original costs as shown by Statement 2 of Exhibit 67, Items 1 to 7 thereof, inclusive.

Q. Is there any other statement that you wish to make in connection with that, Mr. Schutte? I will ask you whether that same exception would apply in any other exhibit or any other testimony in this proceeding where those same figures are utilized?

A. So far as I know those figures have only been utilized in connection with Exhibit 67.

Q. If they are utilized in any other exhibits or subsequent exhibits your same objections would apply?

A. That is correct.

Q. And your opinion that you have expressed now would apply?

A. Yes, sir.

Mr. Lange: Mr. Examiner, I see there is a typographical error here in the spelling of a word in this exhibit, Statement No. 2, "Comparative Statement Showing Cost of Certain Forms:" The word "Forms," F-o-r-m-s, should be "Farms", F-a-r-m-s.

The Trial Examiner: The second line from the top of the page, Mr. Lange?

Mr. Lange: Yes, sir.

The Trial Examiner: Very well, we will have the reporter make that correction.

Cross Examination.

By Mr. Spencer:

Q. Mr. Schutte, referring to the fact that in your opinion Mr. Lusk has overlooked deducting his undistributed construction costs on items of property that have been retired, I think you said about $4,000 was the amount?

A. That is correct.

Q. Is there any detail on that in this Exhibit No. 195?

A. No, sir.

Q. Have you any more detail that what you gave in your direct testimony?

A. No, sir.

Q. In other words, you haven't reduced the error, if any, to a specific schedule or statement?

A. No, sir.

Q. You have not?

A. I did not do that, Mr. Spencer, because I had already taken exception to certain items that are included in this undistributed cost which I suspended for the Commission's consideration in connection with my plant exhibit which I think is No. 139, and until a determination has been made

elimination in connection with the total amount as recorded on the books for undistributed construction expenditures.

Q. Well, then, how do you arrive at your figure of approximately $4,000? Is that an estimate?

A. Using the recorded book figures.

Q. This Exhibit No. 195 relates to Canadian River Gas Company and Colorado Interstate Gas Company?

A. No, 195 is Colorado Interstate only.

Q. I see, and your objections or criticisms of Mr. Lusk's Exhibit No. 67 relates wholly to transactions involving Colorado Interstate Gas Company?

A. That is correct.

Q. And not Canadian River Gas Company?

A. Canadian River Gas Company is not included, no, sir.

Mr. Spencer: I don't know how much additional cross examination there will be on this exhibit, Mr. Examiner, if any, but whatever there is I would like to reserve until sometime next week.

Mr. Lange: In other words, we will defer offering the exhibit until that time.

Redirect Examination.

By Mr. Lange:

Q. Now, Mr. Schutte, in connection with your *accounging* work on this assignment in the present proceedings and with further relation to the exhibit 67 that has been presented in this proceeding by Mr. Lusk, I will ask you whether you have made a study of and have reduced that study to a written statement as to a discussion of the re-accounting for items previously expensed that are now set up and capitalized by the company?

A. Yes, sir.

Q. Is this the written statement that you have prepared in connection with that?

A. Yes, sir.

Mr. Spencer: Do you mean to say, Mr. Lange, that the company had set up these figures that you refer to? You didn't mean that, did you?

Mr. Lange: No. That is set up in Ford, Bacon & Davis'

Mr Spencer: But not on the books of the company.

Mr. Lange: But not on the books of the company.

Q. Will you proceed, Mr. Schutte, to read that written statement?

Mr. Spencer: Before he starts reading I would like to ask a general question if I may, Mr. Lange.

Mr. Lange: Very well.

Mr Spencer: I might say, Mr. Examiner, before I start asking the questions, the point of my questions is this: a few days ago there was read into the record with a reservation to strike in whole or in part, what I termed a treatise on the subject of original cost by Mr. Kenneth L. Smith. The Examiner has not acted upon that as yet because we haven't been prepared as yet to ask him to, but it seems to me that from the standpoint of orderly procedure in *minimumizing* the record that we ought to eliminate in so far as we can all such treatises as a matter of testimony.

If we have to resort to *treatices* and text books and whatnot for support of our accounting treatment or any other kind of treatment of any other subjects, it seems to me it is a matter to be handled in briefs and to be done by argument rather than to come in here and fill up this record with long extended opinions about this or about that. The evil of it is this: As Mr. Smith comes along and puts in his conclusions on this subject, well, in order to rebut that we come along and we want two or three treatises on the same subject, let us say accountants of equal eminence, and before we get through we have yards and reams and reams of that kind of testimony in this record.

Now, I haven't read through Mr. Schutte's statement here. It may not come in that category at all. As I glance through it here it apparently deals with specific items.

The Witness: Factual.

Mr. Spencer: And factual matters rather than, let us say, scholarly or academic discussions on the subject of re-accounting.

The Witness: That's right.

Mr. Spencer: If he does that, I have no objection. Perhaps my objection wouldn't be warranted if he did go into an academic discussion of it, but I am just suggesting that to the Examiner at this time that the more of this we do the more it is going to be necessary to continue it on rebuttal.

Mr. Lange: Well, this study that Mr. Schutte has made relates specifically to this Exhibit 67 heretofore presented in evidence in this proceeding by Mr. Lusk, and is in the nature of a similar treatment to the one prepared by Mr. Lusk just this afternoon that has been submitted and I think it is definitely pertinent as rebuttal testimony on the part of the Commission and certainly is admissible and very relevant to these proceedings.

Mr. Spencer: Well, if it is that—if it is a factual statement based upon specific entries and items, then I don't object to it at all.

The Trial Examiner: Well, in just glancing through the statement it appears to me that it deals in specific amounts and specific matters. I presume all accounting studies and engineering studies perhaps might include one or two conclusions of the witness, but those matters I think are safely dealt with in a proceeding of this kind.

Mr. Lange: I will ask Mr. Schutte right at this point whether he has approached this problem entirely from an accounting standpoint in relation to this matter that he has in his written statement.

The Witness: Yes, altogether from an accounting standpoint.

Mr. Spencer: Well, let me ask one question there, Mr. Schutte. You are dealing here with specific problems relating to these proceedings all the way through?

The Witness: I am dealing here, Mr. Spencer, with the exact items shown in Exhibit 67, Statement 2, which were supported by a report made by Ford, Bacon & Davis dated April 15, 1940. The total amounts are included in the plant account in Exhibit 67 but the breakdown of those items does not appear anywhere because that report of Ford, Bacon & Davis has not been presented here.

Mr. Spencer: You have a copy of it, however?

The Witness: Yes, sir.

Mr. Spencer: Which was furnished to you, I think, through me in the first instance?

The Witness: I believe so, yes, sir.

Mr. Spencer: I would suggest this, Mr. Examiner, that the witness proceed to read the entire statement into the record without interruption and at the conclusion, counsel on this side of the table shall have the right at some subsequent time to move to strike in whole or in part as to any part or parts thereof that may seem objectionable.

The Trial Examiner: Yes, it will be so understood, Mr. Spencer. I think that is the premise we have proceeded on in all these written statements.

Mr. Lange: That is agreeable.

(Vol. LXV, pp. 9388-9405.)

EXHIBIT 196.

Docket G-124.

Written Statement Re Colorado Interstate Gas Company's Re-Accounting for Items Previously Expensed Which It Now Desires to Capitalize.

Witness Carl H. Schutte, Examiner of Accounts.

In the company's statement of original cost of Denver pipe line properties, Exhibit No. 67 in these proceedings, there is included the amount of $284,806.00 (Statement 2, Item 8) as an Adjustment for Capital Items Charged to Expense.

This amount is now claimed to represent fixed capital additions charged to expense on the books of Colorado Interstate Gas Company because of accounting errors.

The nature and extent of such items are said to be fully described and detailed in the memorandum report by Ford, Bacon & Davis, Inc., entitled "Items Charged to Expense on the Books of Colorado Interstate Gas Company During the Period 1930 to 1939, Inclusive, Which Should Have Been Capitalized," dated April 15, 1940.

These items are summarized briefly as follows:

1.	Flood and Washout Control	$ 26,637.68
2.	Rock Weighting	46,683.72
3.	Cattle Guards	4,923.70
4.	Bridges	8,052.93
5.	Rip Rap and Revetments—River and Stream Crossings	24,400.99
6.	Roads and Culverts	32,380.69
7.	Gravel, Rock and Shale for Main Line	9,921.87
8.	Cathodic Protection	49,935.20
9.	Profile Maps	2,989.53
10.	Lowering Lines	638.33
11.	Spare Parts	5,623.84
12.	All Other, Miscellaneous	72,617.88
	Total	$284,806.36

The expenditures covering these items are shown by component costs and by years in Exhibit No. 196.

1. Flood and Washout Control—$26,637.68

Ford, Bacon & Davis, Inc. explain this item as follows:

"These improvements consist principally of building and placing water breaks, cutting spillways and ditches, contour plowing and terracing, all designed to prevent washouts, to carry off the excess surface water and retard water run off to prevent soil erosion. The work was done along the main line right-of-way and adjoining lands on slopes and in arroyos (so-called bad lands) and canyons."

The cost of this work which was started in the year 1930, and of which approximately 46% was accomplished during the years 1938 and 1939, according to Ford, Bacon & Davis, Inc. analysis, is composed of:

Labor	$16,162.18	60.67%
Trucking	7,447.76	27.96%
Materials	1,227.74	4.61%
Other Costs	1,800.00	6.76%
Total	$26,637.68	100.00%

The company's records show that a considerable portion of the above labor and trucking costs, particularly during recent years, vas for contour plowing and terracing on lands adjacent to the pipe line right of way. The cost of such work, which may be termed both corrective and preventive when performed years after the installation of the pipe line, could in my opinion be considered only as maintenance expenses, since the work was performed to protect the pipe line by anticipating causes of failure or of possible injury to the pipe line in order to maintain the pipe line in satisfactory operatng condition.

The company's records also indicate that a considerable portion was actually repair work made necessary because of prior erosion, the cost of which is definitely maintenance expense.

This work was performe.l primarily by the maintenance division in accordance with plans of the operating management, and the costs thereof charged to expenses consistently throughout the years, a procedure in conformity with good accounting practice and under the system of accounts in use which permitted such accounting.

It is a matter of record that such work performed during the years 1938 and 1939 was considered as maintenance expense by the management, and that the accounting treatment thereof as expense was with management's knowledge and approval is further evidenced by copies of letters received from Mr. J. O. Shields, Assistant Treasurer of the company, received in answer to examiners' inquiries.

February 14, 1940

Mr. Carl H. Schutte, Examiner of Accounts, Federal Power Commission, Central Savings Bank Building, 15th and Arapahoe Streets, Denver, Colorado.

Dear Sir: With reference to your letter of February 1st, relative to the increase in the amount charged to Account 388-D in the year 1938, over 1937 and other previous years, we find that this increase is due to the fact that during the year 1938 the Maintenance Division carried on an extensive Flood Control program which raised the trucking expense and labor charges as a considerable amount of contour plowing was done as

well as the excavation of run-off ditches, etc., in this connection.

Trusting that the above will give you the desired information, we are,

Yours very truly,

J. O. SHIELDS,
Assistant Treasurer.

August 15, 1940.

Mr. Allen M. Early, Examiner of Accounts, Federal Power Commission, Colorado Springs, Colorado.

Dear Sir: In reply to your letter of July 10th requesting reason for increase in Account 388-D for the year 1939, we wish to advise that during the summer of 1938 it was decided to improve our roads, trails, bridges, etc., paralleling the pipe line by grading, gravelling, crushing rock, etc., and a great portion of this work was carried over into 1939. Considerable work was also done at places along the line which were eroded on account of flood water and this appears on our time books as "Water Control". This Water Control was installed in accordance with specifications furnished us by the Federal Soil Erosion Engineers.

The amount of the above was approximately $25,750.00, the major portion of which represents labor and trucking.

Yours very truly,

J. O. SHIELDS,
Assistant Treasurer.

"Other Costs" consist of a payment in 1939 of $1,800.00 to the Pueblo County Board of Commissioners by the company's voucher E-1-16. This item was charged to Maintenance of Compressing Station Equipment, Devine Station.

Explanation of this item given verbally by Mr. J. P. McClintock, General Superintendent, Colorado Interstate Gas Company (November 22, 1940), and by letter from Mr. R. W. Hendee, General Manager, to Mr. Lesher S. Wing, Regional Director, Federal Power Commission, dated June 28, 1940, is that the company owns a 4-inch water line ex-

tending from Pueblo, Colorado to the Devine Compressing Station. During 1939 a 6-foot brick storm sewer was built for a distance of some 200 feet outside the city limits of Pueblo. The County Board of Commissioners proposed to make an open ditch extension thereto of approximately 1800 feet, ending same in an arroyo which the company's 4-inch water line crossed. The open ditch extension would have required the moving of the company's water line, since the company owned no fee right of way in connection therewith, and would therefore have had to acquiesce as to the open ditch construction. The estimated cost of moving the water line was approximately $3,000.00, and the estimated cost of completing the drainage sewer as a 6-foot brick closed sewer was approximately $3,600.00. The company, after a study of the situation, offered to pay half the cost of the brick sewer extension in order to protect its existing water line. This offer was accepted and the company paid $1,800.00 to the Pueblo County Board of Commissioners as a contribution in connection with extending the 6-foot brick sewer.

Under the system of accounts in use at the time of this expenditure (Pennsylvania Code), the cost of moving the line was classified as a maintenance expense, as it is analogous to changing transmission lines (Page 86, account No. 386).

Under the Federal Power Commission Uniform System of Accounts for Natural Gas Companies, effective January 1, 1940, the cost of moving lines is also classified as maintenance expense. (See page 93, par. 2, re: Maintenance, in which the rearranging and changing the location of property not retired is one of the specific items mentioned.)

It follows logically that since the cost of moving the line would have been an expense, the cost when incurred for something which was equivalent to moving of a line would also be classified as an expense.

The accounting treatment accorded this expenditure by the company, when incurred, not only appears to have been correct, but no alternative treatment was possible.

2. Rock Weighting—$46,683.72

Explanation given by Ford, Bacon & Davis, Inc. is as follows:

"To insure against the danger and possible interruption of service resulting from washouts, the Company, in addition to flood control measures, weights down its lines by piling rock on the backfill. Where the ground slopes sufficiently to allow water to follow the pipe line ditch, preventive measures are necessary to divert the water way from the backfill. Rock weighting not only serves to divert water but the added weight on the pipe line overcomes the tendency of floating. Rock weighting must not be confused with repairing and filling up gaps and holes in the backfill. This latter work is a maintenance job of a corrective measure which has not been considered in the amount shown for rock weighting."

The cost of this work which was started in the year 1930, and of which approximately 38.5% was accomplished during the years 1938 and 1939, according to Ford, Bacon & Davis, Inc. analysis, is composed of:

Labor	$27,477.41	58.86%
Trucking	19,135.31	40.99%
Material	71.00	0.15%
Total	$46,683.72	100.00%

Despite the statement contained in the explanation of Ford Bacon & Davis, Inc. that rock weighting lines versus repairing and filling up gaps in the backfill must not be confused, the examination of time and trucking tickets disclosed that such confusion does exist. In fact, many of the tickets examined bore very vague and indefinite explanations as to the exact nature of the work performed, leaving much to one's imagination as to whether rock weighting was actually placed on top of the backfill as a means of retarding or preventing subsequent erosion, or whether part of the original backfill had eroded and the work performed consisted of repairs thereto.

The cost of this work, similar to that in connection with

flood control, may be termed both corrective and preventive when performed years after the installation of the pipe line, and could, in my opinion, be considered only as maintenance expenses, since this work also was performed to protect the pipe line by anticipating causes of failure or of possible injury to the pipe line and in order to maintain the pipe line in satisfactory operating condition.

As in the case of flood control work, this work was performed primarily by the maintenance division in accordance with plans of the operating management, and the costs thereof were charged to expenses consistently throughout the years, a procedure in keeping with good accounting practice and, in my opinion, the only treatment possible under the system of accounts then in use. The description of the work performed, as given by Ford, Bacon & Davis, Inc., indicates that this type of work may have been considered as betterments by it.

The system of accounts (Pensylvania Code) in use during the period this work was performed defines (page 44) betterments as physical changes in structures or equipment, the object of which is to make the structures or equipment affected more useful or of greater capacity than they were at the time of their original installation. Such results do not appear to have been accomplished through the performance of this work.

The Federal Power Commission Uniform System of Accounts for Natural Gas Companies, effective January 1, 1940, designates as Maintenance Costs (page 93) the cost of "Restoring the condition of property by wear and tear, decay, or action of the elements."

3. Cattle Guards—$4,923.70

Explanation given by Ford, Bacon & Davis, Inc. is as follows:

> "Cattle Guards eliminate old type gates which are frequently left open, thus leaving the Company liable for damages, and also save time formerly consumed by Company employees in stopping and opening and shutting gates."

The cost of this work, which was started in the year

1930, according to Ford, Bacon & Davis, Inc., analysis, is composed of:

Labor	$3,434.87	69.76%
Trucking	1,133.02	23.01%
Materials	355.81	7.23%
Total	$4,923.70	100.00%

This work was also performed primarily by the maintenance division, generally utilizing scrap materials. The capitalization of labor and trucking costs for the installation of such materials to which no value has been assigned is always questionable.

Cattle guards as installed constitute very minor items of depreciable property and were in effect replacements of other minor items of property.

As such, it is quite in keeping with sound accounting practice to expense such costs, and was permitted under the system of accounts in use. It is a matter of record that this accounting treatment was in accordance with the discretion of the management as exercised under such system of accounts.

4. Bridges—$8,052.93

Ford, Bacon & Davis, Inc. explanation of this item is as follows:

> "Timber bridges make it possible for line walkers and maintenance crews to save time by avoiding wide detours around canyons. Expenses of repairs and maintenance of old bridges were not considered in this study."

The cost of this work, which was started in the year 1930, and of which approximately 74% was accomplished during the year 1930, according to Ford, Bacon & Davis, Inc. analysis is composed of:

Labor	$1,549.78	19.25%
Trucking	545.28	6.77%
Material	432.84	5.37%
Work Orders	$5,525.03	68.61%
Total	$8,052.93	100.00%

Work Order costs of $5,525.03, assigned to expenses during the year 1930, were:

(a) Work Order No. 19, under which expenditures made in connection with assisting Union County, New Mexico, for the construction of a bridge over Corrumpa Creek, were accumulated. Expenditures made by the company in connection therewith were $2,767.33, of which $2,750.00 was, according to the records, a cash donation to Union County, New Mexico. Private pay roll charges of $4.81 are included in the Work Order cost but excluded from Ford, Bacon & Davis, Inc. analysis.

(b) Work Order No. 20, under which expenditures made in connection with assisting Union County, New Mexico, for the construction of a wagon bridge over Travasea Creek, were accumulated. Expenditures made by the company in connection therewith were $2,786.55, of which $2,750.00 was, according to the records, a cash donation to Union County, New Mexico. Private pay roll charges of $24.04 are included in the Work Order cost, but excluded from Ford, Bacon & Davis, Inc. analysis. Thus, these Work Order costs per books aggregate $5,553.88, which amount less $28.85 private pay roll charges equals the $5,525.03 figure of the Ford, Bacon & Davis, Inc. analysis.

The authorization for Work Order No. 19 bears the following explanation:

"We contemplate assisting Union County, New Mexico, with building a bridge over Corrumpa Creek by a cash donation of $2,750.00 and some preliminary expense.

Location—Corrumpa Creek Union County, N. M."

The Work Order was signed by J. P. McClintock, and approved by E.G.H.

A similar explanation was noted on the authorization for Work Order No. 20, except that it was for the bridge over Travasea Creek.

A notation was made on a letter attached to the company's voucher A-47, 1930, as follows:

> "Charge to Investment, Main Line Construction through Work Orders 19 and 20 because it is for the purpose of making our lines more accessible."

This notation was initialed by L.H.S. The Work Orders were closed and the costs thereof transferred to expense by voucher D-427, April 1930, which voucher was approved by L.H.S., thereby indicating a change of opinion by L.H.S. as to the propriety of capitalizing these expenditures.

The facts are that each of these two bridges is located approximately one mile from the pipe line right of way on county roads, and is owned by Union County, New Mexico. The bridges were not constructed until after the company's pipe line had been completed.

The contributions made to aid in the construction of these bridges cannot be classed as costs of units of property, nor can it be said that due to such expenditures, the company's property is any more useful, more efficient, of greater durability, or of greater capacity. It appears, therefore, that the charging of such costs to expenses or surplus was appropriate.

Other bridge costs now sought to be capitalized are composed primarily of labor and trucking charges, the amounts of which were apparently not considered of sufficient importance to be accumulated by individual jobs under work orders, and were expensed in accordance with the company's general policy.

5. Rip Rap and Revetments—River and Stress Crossings—$24,400.99.

Ford, Bacon & Davis, Inc. explain this item as follows:

"Improvements of this type consist of placing rip

rap on stream banks and building of revetments to prevent soil erosion and resulting washouts. After any appreciable rainfall, Company field crews find many new possible danger spots which require revetment and rip rap jobs."

The cost of this work, which was started in the year 1930 and has been carried on consistently since, according to Ford, Bacon & Davis, Inc. analysis, is composed of:

Labor	$ 5,776.14
Trucking	2,480.84
Work Orders	16,144.01
	$24,400.99

Analysis of the Work Order costs included above and assigned to component costs, results in component costs as follows:

	Per Ford, Bacon & Davis, Inc. Analysis	Revision	Component Costs as Revised	Ratio of Total
Labor	$ 5,776.14	$ 5,050.07	$10,826.21	44.37%
Trucking, excavating, and other machine rentals, automobile expenses, etc.	2,480.84	6,943.33	9,424.17	38.62%
Materials		4,150.61	4,150.61	17.01%
Work Orders	16,144.01	(16,144.01)		
Totals	$24,400.99	$	$24,400.99	100.00%

The performance of this character of work under work orders commenced in the year 1934, and accounts for approximately 66% of the total cost of such work which is now sought to be capitalized.

By individual work orders this work consisted of the following specific jobs:

Work Order No. 166—$4,353.47 Work order authorization reads:

"Repairing banks of Sand Creek to prevent further erosion at the 20" gas line."

This work order was closed in June 1934, and the accumulated costs thereunder aggregating $3,374.18 were transferred to expense. This was in accordance with notation on the work order, signed by J. P. McClintock, General Superintendent and approved by "T", General Manager, which read, "Please charge to Transmission Line Expense." In 1935, the work order was reopened and additional charges of $979.29 were accumulated, which amount was assigned to expenses in July 1935. The work performed under this work order consisted largely of hauling brush from Black Forest to Sand Creek and excavation at Sand Creek.

It is indicated from the text of the explanation of this work order, as well as from the character of the expenditures, that the work performed included that of repairing damages caused by erosion.

Work Order No. 173—$1,021.08 This work order authorization reads:

"Strengthen Line at Jimmie Camp Creek Crossing and Installing Brush Breaker and Sloping Creek Bank to Prevent Further Erosion."

This authorization was signed by J. P. McClintock, General Superintendent, and approved by "T", General Manager, and was dated June 1, 1934.

This work order was closed in August 1934 and the costs accumulated thereunder, aggregating $1,021.08, were transferred to expense. These costs as recorded were:

Labor	$ 509.69
Trucking	399.61
Materials	50.82
Automobile Expenses, etc.	60.96
Total	$1,021.08

Trucking charges include the hauling of brush and trees to the job and rental for an excavator. Material costs include expenditures for trees, explosives and cable.

It is also indicated from the text of the explanation of this work order, as well as from the character of the expenditures, that the work performed included that of repairing damages caused by erosion.

It is noted that piling and rip rap were also placed at the Jimmie Camp Creek crossing during the year 1931. Labor costs for this work were $352.52, and were charged directly to expenses as incurred.

Work Order No. 235—$5,764.21, of which $64.36 was originally capitalized and $5,699.85 expensed. Work order authorization reads:

> "Strengthening Main Line at Huerfano River Crossing."

This work order was closed in November 1936 and of the costs accumulated thereunder which totaled $5,764.21, $64.36 covering the cost of two 10-inch river clamps and bolts was capitalized, and the balance $5,699.85 was expensed. The component costs of this work were recorded as follows:

Labor	$1,004.90
Material	2,646.40
Trucking—excavating machine rental, pile driving, etc	1,777.88
Miscellaneous	335.03
Total	$5,764.21

Material costs consist principally of the cost of:

50—70# steel rails	$ 339.14
190—57# " "	1,162.80
65—52# " "	364.65
Plates, bolts, etc.	62.80
1,550 ft. 2-inch mesh wire fence, 72 inches high	463.65

The work performed consisted of placing and bracing the rails and affixing the wire fence thereto, sloping the river bank and backfilling, principally upstream from the pipe line. The cost of two 10-inch river clamps installed on the pipe line in connection with this work was capitalized.

The work order completion notice, dated October 30, 1936, signed by J. P. McClintock, General Superintendent, has the following notation under remarks:

"Please charge the total cost to Main Line Maintenance Expense."

Work Order No. 263—$1,086.34, of which $1,074.30 was charged to expenses. The work order authorization reads:

"Strengthening La Junta Lateral at Apishapa River Crossing."

This work order was closed in July 1937. The component costs thereof as recorded were:

Labor	$ 326.66
Material—principally 51 30-ft. steel rails	334.99
Trucking	192.05
Excavator rental	162.74
Miscellaneous	69.90
Total	$1,086.34

Some of the labor tickets are marked "help repairing 10' crossing." The work performed consisted principally of placing the rails as piling and the hauling and placing of trees, brush and other backfill materials.

The work order completion notice, dated June 30, 1937, signed by J. P. McClintock, General Superintendent, has the following notation under remarks:

"Please charge to Maintenance Expenses."

Work Order No. 268—$862.04. The work order authorization reads:

"Strengthening Line at Timpas Creek with Steel Piling and Rip Rap."

The work order was closed in September 1937, and the costs accumulated thereunder charged to expenses. The component costs of the work were recorded as follows:

Labor	$222.96
Materials, principally sand and cement, $90.89, and 7 30-ft, 65# steel rails, $87.93	193.08
Trucking	195.09
Tractor & excavator charges	174.34
Miscellaneous	76.57
Total	$ 862.04

The work order completion notice dated July 31, 1937, signed by J. P. McClintock, General Superintendent, has the following notation under remarks:

"Please charge to Maintenance Expenses."

Work Order No. 298—$969.18. The work order authorization reads:

"Steel Fence breakers at a dry Arroyo, southeast of Fountain for strengthening the line."

The work authorized thereunder was performed in January 1938 and the costs accumulated under this work order were transferred to expenses in March 1938. The component costs of this work were recorded as follows:

Labor	$ 333.43
Materials, principally 150 feet of 2-inch mesh 72 inches high, chain link fence, and 25 30-foot 25# steel rails	249.91
Trucking and use of excavator and pile driver	334.02
Miscellaneous	51.82
Total	$ 969.18

The work order completion notice dated February 28, 1938, signed by J. P. McClintock, carries the following notation under remarks:

"Please charge Transmission Line Expense."

Work Order No. 334—$1,454.93. This work order covered the

"Strengthening 22 inch line at the Apishapa River Crossing."

The work authorized thereunder was accomplished during the months of September, October and November 1938, and the costs accumulated under this work order were transferred to expenses in December 1938. The component costs of this work were recorded as follows:

Labor	$ 434.37
Material, principally 61 30-foot 45# rails, 122 feet of 6-ft. fencing and 3,143 bd. feet of lumber	448.98
Trucking, use of pile driver and excavator	438.99
Automobile and employee expenses	132.59
Total	$1,454.93

The work order completion notice dated December 5, 1938, signed by Mr. McClintock, carries the notation as follows:

"Please charge to Maintenance of Transmission Line."

Work Order No. 347—$728.21. This work order authorized

"Strengthening 20 inch main line at Bayou Gulch, ¼ mile north of Gate 27."

The work authorized thereunder was accomplished in April 1939 and the costs accumulated therefor were transferred to expenses in May 1939. The component costs of this work were recorded as follows:

Labor	$ 272.06
Materials, principally steel rails, bars and bolts	201.64
Trucking, use of pile driver, etc.	186.38
Employee expenses	68.13
Total	$ 728.21

The work order completion notice dated June 6, 1939, signed by J. P. McClintock, General Superintendent, carries the following notation:

"Please charge to Maintenance Expense."

Other costs of placing rip rap and installing revetments were not accumulated under work orders; but in general covered costs similar to those incurred under work orders.

It is obvious from the notations on the work orders as quoted that the operating management of the company considered this character of work as maintenance, and that in exercising its discretion under the system of accounts then in use, consistently classified such expenditures as expense.

Capitalizing the costs incurred in building revetments and placing of rip rap, when incurred several years subsequent to the completion of initial construction, and particularly when placed on property not owned or leased by the company, would be very questionable accounting treatment for such costs. Generally such work is both corrective and preventive, in that it repairs damages caused by erosion as well as retards or prevents subsequent erosion.

The expensing of such costs, which practice was consistently followed by the company, not only conforms with good accounting procedure and is permitted under the system of accounts used by the company, but has also been subject to examination in the course of annual audits performed by members of the Auditing Department of Standard Oil Company of New Jersey. Inasmuch as such audits have caused no change in the company's policy of expensing such costs, the only possible conclusion is that this was the approved practice.

6. Roads and Culverts—$32,380.69.

Explanation of this item by Ford, Bacon & Davis, Inc., is as follows:

"Maintenance crews and line patrols require adequate road facilities to traverse the lines. When heavy machinery is necessary for making line repairs, roads for access to the [illegible]

The company's road program calls for widening, extending and graveling, carried out each year, to insure safe and adequate roads in close proximity to the pipe line. The road from Canyon to Apishapa, known as the Dolan Highway, approximately 33 miles long, was originally constructed by the pipe line crews in 1928. The widening and extending of roads often necessitates new and wider culverts."

The cost of this work charged to expense by the company from January 1, 1930 to December 31, 1939, and of which approximately 49% was accomplished during the years 1938 and 1939, according to Ford, Bacon & Davis, Inc. analysis, is composed of:

Labor	$15,227.69	47.03%
Trucking	8,753.18	27.03%
Materials	555.98	1.72%
Work Orders	7,843.84	24.22%
	$32,380.69	100.00%

Analysis of the work order costs included above and assigned to component costs, results in component costs as follows:

	Per Ford, Bacon & Davis, Inc. Analysis	Revision	Component Costs as Revised	Ratio to Total
Labor	$15,227.69	$2,250.72	$17,478.41	53.98%
Trucking	8,753.18	3,607.07	12,360.25	38.17%
Materials	555.98	1,130.82	1,686.80	5.21%
Automobile & Employe Expense		855.23	855.23	2.64%
Work Orders	7,843.84	(7,843.84)		
Total	$32,380.69		$32,380.69	100.00%

This character of work, accomplished under work orders during the year 1938, accounts for approximately 22% of the total cost of such work which is now sought to be capitalized.

The authorization for Work Order No. 328 reads:

"Repairing Pipe Line in the Apishapa District."

Work under this order commenced in August 1938, and the accumulated costs thereunder totaling $5,817.34, including $177.24 private payroll charges which are excluded in the present claim for capitalization, were transferred to expenses in November and December 1938.

A notation on the work order completion notice, dated November 5, 1938, signed by J. P. McClintock, General Superintendent, and approved by R.W.H., General Manager, reads:

"Please charge to extraordinary expense."

The authorization for Work Order No. 336 reads:

"Repairing Canon Picketwire Hill Road."

Work under this order commenced in October 1938, and the accumulated costs thereunder totaling $2,203.74 were transferred to expenses in December 1938, in accordance with notation on the work order completion notice dated January 6, 1939, signed by J. P. McClintock, General Superintendent, which read:

"Transmission Line Expense."

The maximum annual expenditure for general road work, exclusive of specific jobs covered by work orders, was in 1931, when $6,735.75 was expended for that purpose and charged to expenses. An examination of all labor charges included in the re-accounting for 1931, amounting to $4,637.76 for this character of work, indicated that a considerable part of such labor costs was incurred on the road said by Ford, Bacon & Davis, Inc. to have been constructed by the pipe line crews in 1928.

It is not indicated from any of the labor and trucking tickets covering road work, which were examined, many of which describe the work performed as "Hard gravel—main line road," that the cost of such work should be considered as capital expenditures.

It is indicated in the explanation relating to this char-

acter of work that existing culverts were replaced by new and wider culverts. No retirements were identified for such replacements if made.

7. Gravel, Rock and Shale for Main Line—$9,921.87:

This item is explained by Ford, Bacon & Davis, Inc., as follows:

> "This item includes the cost of rock, gravel and shale used in rock weighting the pipe lines and for road building."

The facts are that this item is of the identical character of items 2, Rock Weighting, and 6, Roads and Culverts.

The labor and trucking tickets covering the items now designated as additional plant costs, in general identify the work performed so vaguely that the assignment of such costs to plant accounts at any time would be very questionable. Obviously the reason these particular costs are re-accounted for in a separate caption, instead of being included in items 2 and 6, is that identification thereof as between rock weighting or road work was impossible.

Labor and trucking tickets scrutinized bore descriptions of work performed as follows:

> "Getting out rock for Main Line."
> "Hauling rock on Main Line."
> "Hauling rock to fill in along line."
> "Build up road."
> "Fill in Main Line Road with Rock."

To classify costs so described as Plant Additions appears to be entirely too liberal an interpretation of instructions contained in any system of accounts.

The cost of this work, charged to expense by the company during the years 1932 to 1940, inclusive, and of which approximately 81% was accomplished during the years 1938 and 1939, according to Ford, Bacon & Davis, Inc. analysis, is composed of:

Labor	$2,481.63	25.01%
Trucking	7,301.89	73.59%
Material	138.35	1.40%
Total	$9,921.87	100.00%

8. Cathodic Protection—$49,935.20.

Ford, Bacon & Davis, Inc. give the following explanation for this item:

> "Cathodic protection is definitely a major improvement insuring a more durable pipe line system. Subsequent to January 1, 1940, the Company will capitalize all expenditures for this class of improvement. Work Order No. 350 in 1939 covered a soil resistance survey. These tests and expenditures are a usual forerunner for cathodic protection, but nevertheless have not been included as part of the capital expenditure. This amounted to $10,040 in 1939."

The work of installing cathodic protection commenced in the year 1935 and has been carried on continuously since. Installations to December 31, 1939 were of the character known as the "Zinc Rod" type. Practically all of this work has been performed under work orders and the largest expenditures therefore made in the year 1937, when $21,416.45 was recorded for such work.

That the assignment of such costs to expenses was not due to accounting errors but definitely because of the company's policy, is evidenced by the circumstances in connection with $2,228.58 of such costs accumulated under the company's Work Order No. 282, in 1937.

Under this work order, zinc rod type of cathodic protection was installed, according to accounting data and engineering maps, on 8,800 feet of 6-inch pipe line within the section to be maintained by The Arkansas Valley Natural Gas Company. The total cost of this work was charged to Account No. 385-D, Maintenance of Transmission Line Equipment, at the suggestion of Mr. F. H. Lerch, Jr., then Vice President of the company.

The title of this specific work order indicated that the cost of the work to be performed thereunder was chargeable to The Arkansas Valley Natural Gas Company (presumably in accordance with the terms of the agreement of December 5, 1935) and the work order completion notice, dated November 10, 1937, signed by Mr. J. P. McClintock, General Superintendent, bore the following notation under remarks:

> "'Please charge to Arkansas Valley Natural Gas Company, maintenance expense on 6" line from Arkansas Valley River Crossing to Fort Lyon."

The cost of work orders is normally charged by the Respondent as recommended by Mr. McClintock. However, in this instance, Arkansas Valley Natural Gas Company objected to the charge, as evidenced by copy of a telegram dated January 28, 1938, from the Colorado Springs office to the New York office, in which the recommendation of Mr. F. H. Lerch, Jr., then Vice President of Colorado Interstate Gas Company, as to the disposition of the charge was requested. In Mr. Lerch's reply of the same date, he suggested that the charge be made to Colorado Interstate Gas Company as similar items in the past, which had been expensed.

This indicates that the company's management knew of and approved the practice of expensing such costs, and it is accordingly obvious that such expensing of the cost of installing zinc rod cathodic protection is not due to accounting errors but is in keeping wtih the management's policy.

The installation of cathodic protection since January 1, 1940, according to Mr. Lusk's testimony of November 13 and 27, per Official Stenographer's Reports, Volume IX, page 1276, commencing at line 13, and Volume XVII, page 2419, lines 24 and 25, is of a different type. The installation under Work Order No. 360 required changes in the telephone line, installation of a 2300-volt and 10-volt power lines on the telephone pole line, the installation of 1½ kva transformers, and rectifiers.

The installation of cathodic protection under Work Order No. 361 required the erection of structures to house two

Jacobs Special Natural Gas Engines which provide the electric energy necessary for protection and installation of a 10-volt distribution line and rectifiers.

Thus, the capitalization of the costs of providing this protection is not merely a change in the company's policy with respect to such costs, but concerns an entirely different type of cathodic protection from the physical property aspect.

9. Profile Maps—$2,989.53.

This item is explained by Ford, Bacon & Davis, Inc., as follows:

> "Profile maps are considered as an investment in maps, drawings, etc. Ordinarily this would be part of engineering costs if made during construction. These drawings were apparently not made and were not necessary in that period; but later were found necessary and represent costs in addition to the usual engineering costs."

This work was performed under Work Order No. 270, during the years 1938 and 1939, but utilizing spare time of various employees of the company's engineering division.

Inasmuch as profile maps appear to have been unnecessary during the period of pipe line construction, and for a long period thereafter, the present preparation thereof appears to be entirely for operating purposes; therefore, the cost of repairing such profile maps appears to be an operating cost rather than a plant cost.

10. Lowering Lines—$638.33.

The explanation given by Ford, Bacon & Davis, Inc., for this item is as follows:

> "Lowering the pipelines to prevent washout and possible break in the river, stream, and so-called 'dry' gulch crossings, is distinctly a betterment."

This charge represents the cost of Work Order No. 296, which covers "Lowering two 10-inch Lines across the St. Charles River," the accumulated costs totaling $638.33 of

which were transferred to expenses in March 1938, in accordance with notation on the Work Order completion notice signed by J. P. McClintock, General Superintendent, which read:

"Please charge Transmission Line Expense."

The component costs of this work as recorded were:

Labor	$ 56.54
Material (Explosives)	3.93
Trucking & Excavating	484.59
Automobile & Employee Expenses	93.27
Total	$ 638.33

The lowering of lines is more or less a continuous process in that the streambeds are constantly subject to erosion, and are being lowered, which necessitates the lowering of the pipe lines crossing such streams and arroyos.

The usual procedure followed by the company with respect to the lowering of lines has been to retire materials removed, capitalize new naterials installed, and expense at least an amount estimated for excavating the original trench.

In the present instance, the request to now capitalize the entire cost of the job would place in the plant account a duplicate cost of trenching and backfilling—that is, such cost thereof as was capitalized at the time of initial installation—plus the amount expended to excavate and backfill a like trench, without retirement of such initial cost, which procedure is obviously incorrect.

Under the system of accounts in use at the time of these expenditures (Pennsylvania Code), the cost of changing transmission lines was definitely classified as maintenance expense under account No. 386 (page 86).

Under the Federal Power Commission Uniform System of Accounts for Natural Gas Companies, effective January 1, 1940, the cost of "Rearranging and changing the location of property not retired" is also definitely classified as maintenance expense (page 93).

11. Spare Parts—$5,623.84.

Ford, Bacon & Davis, Inc. explanation of this item is as follows:

> "Spare parts for machinery and equipment, whether carried in the supply inventory or installed in the pipe line system, represents a cash investment. Their availability for use or actual use may represent a saving in time far in excess of the actual money value involved."

The costs now said to be capital expenditures, practically all of which are incurred for parts, were incurred as follows:

Year 1936	$ 773.80
Year 1937	136.97
Year 1939	4,713.07
Total	$5,623.84

The disbursements covering the above items, which were charged to expenses as made, were reviewed and consist primarily of repairs to or repair parts for engines and compressors. In no instance does it appear that the disbursement covers what could be termed a retirement unit. The disbursements cover a considerable quantity of gaskets, packing, springs and the like, which when installed could not possibly be considered a capital addition, and to account for same as replacements would require the retirement of the replaced parts.

The largest individual items included in this re-accounting are:

4 cylinders with piston pins and rings complete	$ 892.00
4 piston pin boxes	76.00
4 connecting rod wedges	21.00
Sundry pipe and connections, freight, etc.	101.04
	$1,090.04

These were for Bruce-MacBeth Engines at Canon.

92 steel piston rings, 8 scraper rings, 56 sets points, etc., for compressors and engines at Canon	$ 461.42

The cost of such repair or spare parts as are included in this item may be properly assigned to the supply inventory account if held for use, or to the appropriate maintenance account if immediately used. If included in the supply inventory, such costs are automatically given consideration in connection with the company's working capital requirements.

Except when retirement units, such costs are not properly capitalizable, and to capitalize same as replacements or renewals, which they obviously are, requires the retirement of the cost installed of the unit replaced. If capitalized without recording the retirement of the previously existing part, a duplication of the cost of such part appears in the plant account.

12. All Other, Miscellaneous—$72,617.88.

This item is explained by Ford, Bacon & Davis, Inc., in the following manner:

> "All other, Miscellaneous Classification includes a multitude of small charges, such as landscaping at stations, villages and camps; curbing and walks, chicken houses, screen for porches, pipe racks along the main line, gate boxes; linoleum for dwellings; trees and shrubbery, and tools. There are also charges for hauling and placing earth fill at stations, camps and villages and gravel for walks. The completion details, otherwise known as the clean up of the three compressing stations, for some reason were not included in work orders. All items, including safety guards around engines, earth fill and charges for general clean-up were expensed."

The Ford, Bacon & Davis, Inc. analysis shows the component costs accumulated for the above as follows:

Labor	$37,240.29	51.28%
Trucking	11,563.19	15.92%
Materials	9,284.61	12.79%
Work Orders	14,529.79	20.01%
Total	$72,617.88	100.00%

Ford, Bacon & Davis, Inc., statement that this item covers a multitude of small charges is not an exaggeration. Costs of materials included herein, are as small as a charge for a small piece of sheetrock at a cost of fourteen cents. Numerous items costing less than one dollar are included. Many of the items included appear to be minor replacements and renewals. The cost of repairs of equipment, such as "bushings for plow @ $0.89, welding end on grader at $0.79" appear. The cost of leak clamps and of repairing leaks along the Arkansas Valley lines are included. Material costs for grass and clover seed, fertilizer, trees and shrubbery at the several stations and camps total approximately $750.00, such purchases being included in almost every year including 1939. The labor and trucking costs for such items were not all identified.

The cost of small tools herein included amounts to approximately $450.00 and includes the cost of such items as snow shovels, screw drivers, hack saw frames, steel drills, oilers, rules, a spittoon; items which normally have a very short life. Substantially all of the tool costs are in amounts of from $1.00 to $10.00 each.

The costs of making tool boxes, workbenches, compressor repair parts and many other items too numerous to mention are likewise included in this re-accounting.

The Federal Power Commission Uniform System of Accounts for Natural Gas Companies, under Components of Construction Cost, Note A (page 40) says:

> "The cost of individual items of equipment of small value (for example $10 or less) or of short life, including small portable tools and implements, shall not be charged to gas plant accounts unless the correctness of the accounting therefor is verified by current inventories. The cost may be charged to the appro-

priate operating expense or clearing accounts, according to the use of such items, or, if such items are consumed directly in construction work, the cost shall be included as a part of the cost of the constructed unit."

The company's policy of charging the cost of minor items of property to expenses conforms with the instruction quoted above.

Costs now re-accounted for which were accumulated under work orders total $14,529.79, and by specific work orders are as follows:

Work Order No.	Year 1930	Year 1931	Year 1936	Year 1937	Year 1938
8	$ 345.77				
35	1,148.80				
40		$ 503.16			
50		485.99			
101		7,274.60		$ (552.96)	
167			$343.20		
211			113.10		
269				2,416.60	
285				1,737.42	
290				625.57	$88.53
Total	$1,494.57	$8,263.75	$456.30	$4,266.64	$88.53

Work Order No. 8 Colorado Springs Lateral—$345.77. The total cost of this work order was $524.33, and consisted principally of traveling expenses, hotel bills and entertainment. By Voucher No. L-271, November 1930, this amount was transferred to Plant Account No. 226 D—Transmission Line Equipment; then by Voucher No. L-272, November 1930 (the very next voucher) this amount was removed from the above Plant Account and charged to Gas Expenses, Account No. 381 D—Other Transmission System Supplies and Expenses.

Some of the expenditures charged to this work order were incurred during 1929. Although the work order authorization indicates that the work to be performed there-

under is in the nature of "Preliminary Surveys and Maps," the expenditures made do not appear to be for that type of work. A notation on the work order signed by J. P. McClintock reads:

> "The Colorado Natural Gas Co. have a contract to furnish Gas to the City of Colorado Springs. Expense? Transfer all material."

Construction of the Colorado Springs Lateral commenced in June 1931 under Work Order No. 119. Miscellaneous labor costs of $54.07 incurred in 1928 and originally recorded on Ford, Bacon & Davis, Inc. books were transferred to the Colorado Springs Lateral Plant Account, but none of the costs accumulated under Work Order No. 8 were then re-accounted for.

Inasmuch as it appears that expenditures made under Work Order No. 8 were in the nature of costs in connection with negotiations, rather than actual preliminary work in connection with the Lateral, the expensing of such costs upon abandonment of negotiations appears to be correct treatment thereof.

Work Order No. 35. Strengthening C. F. & I. Lateral at St. Charles River Crossing—$1,148.80. Work performed under this work order consisted of driving 22- and 30-foot Red Spruce Piling. Material costs amounted to $637.27 and labor costs $511.53. The work was performed during the period December 1929 to March 1930, and the costs thereof were transferred to expenses in September 1930.

The river crossing was constructed in 1928 as a part of the C. F. & I. Lateral.

The expensing of the costs of Work Order No. 35, as recorded by Voucher J-420, was approved by L.H.S.

Work Order No. 40. Wrecking Camp and Hauling Fixtures, Equipment and Machinery to Storage at Devine Warehouse—$503.16. Labor costs under this work order amounted to $510.88, and net salvage of miscellaneous materials was a credit of $7.72, resulting in the net amount of $503.16 as above. All of the expenditures for this work were incurred in December 1929.

Work Order No. 50. Repairing Telephone Line from Main Line to Coolrado Springs. Replacing Poles. Line known as Colorado Springs Cutoff—$485.99. The work performed under this work order was accomplished during the month of July and August 1930 at a total cost of $594.50, of which $108.51 covered private pay roll charges, which amount is excluded in the present re-accounting. Material costs were $160.10, principally for 30 20-foot, seven 30-foot and one 35-foot poles. Trucking charges were $160.00 and general pay roll charges were $111.34.

The retirement of poles replaced, as is indicated by the work order title, is not a matter of record.

Work Order No. 101. Drilling Water Wells at Canon Station, Canon Station Water Supply.

Amount expensed in 1931	$7,889.49
Transferred from Expense to Plant Account in 1937 (Field Well No. 4)	552.96
	$7,336.53
Less: Private pay roll excluded from present claim	614.89
Amount now claimed as Plant Cost	$6,721.64

Six water wells were drilled during the year 1930 in connection with the construction of the Canon Compressing Station. The cost of these wells to December 31, 1930 was $19,606.91, all of which was capitalized. The recorded cost of Wells Nos. 1, 2, 5 and 6 was retired by the company in 1939, these wells having been abandoned. Thus the cost of wells Nos. 3 and 4, both small producers, remains in the Plant Accounts on the company's books as of December 31, 1939.

Four other wells were drilled at the station site during the years 1932, 1934 and 1936, according to a letter dated July 18, 1939 to Mr. J. P. McClintock, General Superintendent, from J. W. Hopkins, Chief Engineer, Canon Compressing Station, the costs of which were not assigned to Plant Accounts, as these wells were unproductive.

Wells drilled under Work Order No. 101, except for Adam Arnett Well No. 4, were likewise found unproductive, and the costs thereof accumulated under this work order were also expensed in the year 1931. The cost of drilling the Adam Arnett Well No. 4, however, was subsequently transferred from expenses and charged to Plant Accounts in connection with additional wells drilled under Work Order No. 269 in 1937. This amount so capitalized consisted of:

208 Ft. 6 in. of 8¼" casing	$282.96
Drilling	190.00
Use of tractor for drilling	70.00
Miscellaneous expenses	10.00
Total	$552.96

It is therefore obvious that the cost of the only productive well drilled under this work order was capitalized and only the cost of unproductive prospecting expensed.

The expensing of the drilling costs of abandoned unproductive or incomplete wells appears to be not only in accordance with the policy continually followed by the company in the exercise of its choice as permitted under the system of accounts, but also the preferable treatment of this character of cost in accordance with sound accounting principles.

An alternative method would be to charge such costs to a deferred expense account, and subsequently amortize such costs by charges to appropriate expense accounts.

Although the cost of prospecting for water in advance of the construction of a compressor station could be capitalized as preliminary engineering or construction expenses, since such prospecting would be for the purpose of locating the station with consideration of the availability of an adequate supply of satisfactory water, the propriety of capitalizing the cost of unproductive prospecting for water years later is an unwarrantable interpretation of the instructions in the system of accounts, since such unproductive prospecting certainly adds nothing to the usefulness, efficiency, durability or capacity of the property.

Work Order No. 167. Curbing along sidewalk at Devine Station—$343.20. The cost of the work performed under this work order was $1,343.20 and was accomplished, apparently by utilization of the spare time of station employees, during the period February 1934 to April 1936. Of the total, $1,000.00 was capitalized and $343.20 expensed in accordance with notation of the work order completion notice dated September 28, 1936, signed by J. P. McClintock, General Superintendent, which reads,

> "Please charge $1,000.00 to investment and the balance $343.20 to Station Operating Expense. (Men also maintained lawns and trees while doing this work.)"

Work Order No. 211. Lowering 8" Line on the Portland Lateral at the Fountain Creek Crossing—$113.10. The work performed under this work order was accomplished during the months of January and February 1936 at a recorded cost of $1,239.86, of which $1,126.79 was capitalized and $113.10 was charged to expenses in accordance with notation on work order completion notice dated March 31, 1936, signed by J. P. McClintock, General Superintendent, which requested such assignment of cost.

It appears that consideration was given to the initial installation costs by expensing the amount of $113.10, since no retirement thereof was indicated in connection with the cost of lowering this line, as would be necessary if the entire cost of the lowering of the line had been capitalized.

Work Order No. 269. Prospecting for Water at Canyon Compressor Station—$2,416.61. The cost of the work performed under this work order and transferred to Plant Accounts and Expenses in 1937 was $3,823.12, of which $1,383.25 was capitalized and $2,439.87 was expensed. Private pay roll charges of $23.26 are deducted from the amount expensed to arrive at the present claim of $2,416.61 now said to be a proper capital charge.

The assignment of the above amounts to fixed capital and expenses are in accordance with notation on the work order completion notice dated December 10, 1937 signed by J. P. McClintock, General Superintendent, which reads:

> "Charge Investment: Well No. 4 $85.96; Well No.

6 $785.42; Well No. 8 $511.87. Balance of W. O. charge to expense of developing Canyon Station Water Supply. For balance of Investment see letter attached."

The letter, attached to Voucher No. M-36, December 1937, is as follows:

(Copy) Colorado Interstate Gas Company

Work Order #269—"Prospecting for Water for the Canyon Station Supply."

Colorado Springs, Colo., Dec. 9, 1937.

J. O. Shields

Work Order No. 269, cost of Prospecting for Water for the Canyon Station Supply. During the development of this water we started in with the well drilled on Work Order #101, being Adam Arnett Well Number 4, and equipped with drop pipe, rods, jack, and engine for pumping it several months, for a test. We then moved 200 feet north of this well and drilled No. 5, on W. O. 269. This well proved to be no good and was abandoned. All material salvaged. We then moved South of No. 4 well and drilled No. 6 which was a successful well, which we equipped and pumped for a considerable time.

Meantime, we moved farther South and drilled No. 7 well to a depth of approximately 190 feet, where we lost the tools, including the bit and stem. We were unable to recover the tools, therefore, skidded the drilling machines approximately 10 feet north, and drilled well No. 8 which proved to be a good well. Number 8 was equipped with 8¼" casing only. Following is the amount of expense and material in connection with this work that is charged to investment:

Well #4		Well #6	
Labor	$16.06	Labor.	$252.51
Material:		Material:	
259′ of 4″ pipe	97.64	258′ of 4″ pipe	105.50
1 working barrel	50.71	Working Barrel	50.71
Use of tractor	15.15	215′7″ 8¼″ casing	294.11
Chapman's Exp.	6.40	Tractor	72.59
	$85.96	Chapman's Exp.	10.00
			$785.42

Well #8

Labor	$150.27
Material:	
212′4″ 8½″ casing	289.18
Use of tractor	49.49
Drilling Rig	12.93
Chapman's Exp.	10.00
	$511.87

As Number 4 well was drilled in 1930, and at that time was pumped for a considerable period of time, showing it to be a good well, we did not pull the 8¼″ casing, but left it in the well with the expectation of reclaiming the well later, which was done. In addition to the above investment charges to No. 4 well, we should charge it with 208′6″ of 8½″ casing, $282.96, additional drilling by $190.00, use of tractor for drilling, $70.00, Misc. Expense, $10.00.

At the present time the well No. 4 and No. 6 are equipped with Wood Sucker Rods. These rods will be taken out and placed in stock by transfer and be replaced by new steel rods which are on order at this time. The new steel rods will be charged to W. O. #292 and the amount transferred to each well will be shown on that work order. Any other items of material and labor in connection with the investment necessary to equip and put these wells in operation will appear in Work Order 292.

Yours very truly,

JPM/wb J. P. McCLINTOCK.

From the above information it appears conclusive that the costs expensed were correctly handled.

As previously stated in connection with the costs under Work Order No. 101, the cost of prospecting for water in advance of the construction of a compressor station could be capitalized as preliminary engineering or construction expenses, since such prospecting would be for the purpose of locating the station with consideration of the availability of an adequate supply of satisfactory water; however, the capitalization of costs of unproductive prospecting for water years later appears improper, since such unproductive prospecting adds nothing to the usefulness, efficiency, durability or capacity of the property.

Work Order No. 285. Lowering 10-inch Littleton Lateral on Highway east of University Avenue—$1,737.42. The work performed under this work order was accomplished during the period July to November 1937, at a total recorded cost of $2,363.69, of which $442.04 covering the cost of pipe and fittings used to replace pipe retired, was capitalized and $8.16 for certain water station equipment was transferred to Work Order No. 281. The balance, $1,913.49, including $176.07 of Private Payroll charges, which amount is excluded from the present claim for capitalization, was expensed in November 1937.

The usual procedure of crediting the Plant Account with the cost, exclusive of installation cost, of the materials retired, the capitalization of the cost of new materials installed, and the expensing of the costs of removal together with the cost of installing the replacing equipment was adhered to. By this method, the initial installation costs remain in the Plant Accounts.

The fact, however, that the company disposed of the Littleton Lateral during the year 1939 by charging the excess of the investment recorded for this lateral as compared with the theoretical depreciation reserve applicable thereto, to expense by Voucher No. M-33, December 1939, was either overlooked or ignored.

Since the company no longer has a financial interest in this lateral, it is obvious that no consideration of the present claim is warranted.

Work Order No. 290. Drilling Water Well at Travesser Camp—$714.10. The work performed under this work order consisted of the drilling of three wells, only one of which was kept for use. The total costs accumulated therefor, which were transferred to capital and expense in 1937, amounted to $1,251.15. The costs of all materials used for the producing well and a 2-inch water line, together with an apportionment of labor and trucking costs, in all, aggregating $625.58 or one-half of the total expenditures accumulated under this work order, were capitalized. Labor costs of $88.53, incurred in 1938, were expensed.

The assignment to capital and expenses of the above costs conforms with the notation on the work order completion notice dated December 30, 1937, signed by J. P. McClintock, General Superintendent, which reads,

> "Please charge ½ to Investment and ½ to expense of developing better water. (3 wells drilled, only one kept for use.)"

The costs of the unproductive prospecting were treated in a manner similar to like costs incurred under Work Order Nos. 101 and 269, and the explanation given in connection with the costs of those work orders is also appropriate in this connection.

In general, it ordinarily has been the company's procedure to issue formal work orders under which it accumulated the costs of specific jobs of any consequence whether capital or maintenance. Upon completion of the jobs, the job costs have been closed out of Construction Work in Progress, and transferred to other accounts, generally to those specified by the General Superintendent or some other responsible official.

Of the total expenses of $284,806.36 now claimed as plant, $97,586.82 or 34% thereof was covered by work orders and was charged to expense by the company on the basis specified by company officials and approved by its accounting officers.

The balance of $187,219.54 represents the cost of work originally expensed, now claimed as capital, which was not covered by work orders, and is made up of the costs of a

multitude of items, the expensing of which when incurred was also directed by responsible company officials and approved by the chief accounting officer. These items in greater part cover the cost of work performed which appears to have been handled as routine work in connection with operations by regular employees.

From an examination of the company's records it is clear that the management consistently, through responsible officials, to the extent that any item might have originally been considered capital or expense optionally, exercised its discretion as permitted under the systems of accounts used, in assigning such costs to expense. The charging of the costs to expense was not only approved by responsible company officials including the chief accounting officer, but has also been examined and accepted in audits made by members of the Auditing Department of Standard Oil Company of New Jersey, and also accepted by the Bureau of Internal Revenue for income tax accounting.

From the foregoing recital of facts, it is clear that the expensing of the costs now claimed as plant does not represent accounting errors, which may be corrected under the provisions of the Federal Power Commission's Uniform System of Accounts, but rather, that the costs in question were properly recorded as expenses in accordance with sound accounting principles at the time. Accordingly, the Company, in my opinion, is prohibited from realizing its claim for restatement.

Undistributed Construction Costs:

Ford, Bacon & Davis, Inc. Memorandum Report of April 15, 1940 contains the following statement in connection with this item:

> "With reference to the item entitled 'Undistributed Construction Costs,' an estimate has been made of a proper percentage to cover supervisory, administrative and engineering overhead costs which were expended on account of the other capital items listed in the attached schedules. Also, this same percentage has been applied and is included in these schedules in an amount based upon all construction projects that have been

carried on by the Company and actually capitalized since the beginning of operations.

"The amounts of these general construction costs applicable to capital expenditures are summarized in Part V of the schedules and are supported by the attached statements showing the analysis of the actual book records. This analysis was made to include consideration of administrative, legal, clerical and engineering costs, including engineering fees paid to Ford, Bacon & Davis, Inc. from 1929 to 1939. The book analysis excluded consideration of interest, taxes and the usual preliminary and pre-organization expense items. As shown on the statements, certain items of expense have been transferred from the general expense to operation and maintenance. Those are amounts which are not strictly items of general expense, but comprise generally 'dumping ground' accounts such as injuries and damages, absent time due to injuries, and like accounts. The management fees paid to Ford, Bacon & Davis, Inc. in the early years of operation have been excluded from consideration in this study as these fees are regarded as applying to operating costs and not as a part of the general overhead to be applied to investment."

Item No. 9 of Statement 2, Exhibit 67, represents what is termed "Adjustment for General Construction Costs Applicable to Net Property Additions and Capital Items Expensed", $155,244.00.

This is the total amount now sought to be capitalized for:

A.	Corporate and Engineering Costs	$112,967.55
B.	Interest During Construction	$42,276.45

Corporate and Engineering Costs.

Ford, Bacon & Davis, Inc. in the Memorandum Report of April 15, 1940, say:

"In the study the corporate and engineering costs have been given combined consideration. The process generally has been to determine the percentage relationship of corporate and engineering costs to the con-

bined costs of operation and maintenance expense and the gross property additions; that is, general administrative and engineering officers exercise control over the operation and maintenance of the properties while in operation and also supervise and control the construction expenditures made during that period. The problem is to allocate a portion of the corporate and engineering costs to the primary costs of construction work which have been or should have been capitalized. These costs have been determined and are summarized herein on the second page of Part V. Based on the five-year averages as shown on that statement, the incremental cost of corporate and engineering costs to be applied to construction work performed during operation was determined to be 6.74 per cent. . . . .

"After consideration of the relationship of the five year averages in the years ended 1933 and 1938, and in other data shown on the second page of Part V, 6.5 per cent was considered a reasonable percentage to apply for corporate and engineering costs to the items of investment that have been capitalized on the books of the Company from 1929 to 1939 and also to the items that have been charged to expense on the books of the Company which should have been capitalized. . . ."

Corporate and Engineering Costs as used in Item No. 9 of Statement 2, Exhibit 67, and in Statement 10, Exhibit 76 (line 11) are $112,967.55, whereas the amount for these costs as presented in the Ford, Bacon & Davis, Inc., Memorandum Report of April 15, 1940 (page 343) was $113,687.69.

During the early years of operation, engineering and management services were provided by Ford, Bacon & Davis, Inc. under contracts, the engineering agreement being terminated as of June 2, 1933 and the management agreement terminated as of June 30, 1936.

Engineering services rendered by Ford, Bacon & Davis, Inc. during the period the engineering contract was effective, were billed by it, and the cost of such services, including construction fees assigned to appropriate work orders and/or plant accounts by the company. It has been the

company's customary procedure to charge appropriate work orders and plant accounts with the cost of engineering and supervisory services performed by members of the company's engineering personnel. Such charges were based on time reports. Expenses usually were readily identifiable with specific jobs and were charged thereto.

It has not been customary procedure, however, since 1928 (completion of initial construction) to make any allocation of general administrative expenses, such as salaries and expenses of general officers or of general office clerks. Expenses incurred when identified with specific jobs have been assigned thereto as direct charges, but no general expense allocations have been applied.

The volume of General Administrative Expenses has not fluctuated in accordance with the volume of construction work performed, nor does the trend appear to be influenced by the combined expenditures of operation, maintenance and construction. In fact, the trend of General Administrative Expenses generally has been opposite to that of either Net Property Additions or the combined total of Net Property Additions and Operation and Maintenance Expenses. This is clearly illustrated by the following tabulation:

Year	Net Property Additions, Ford, Bacon & Davis, Inc. Memorandum Report dated April 15, 1940, Page 343, Line 1	Operation and Maintenance Expense, Ford, Bacon & Davis, Inc. Memorandum Report dated April 15, 1940, Page 344, Line 1 (Note A)	Total	General Administrative Expense, Ford, Bacon & Davis, Inc. Report, Exhibit No. 76, Statement 10, Line 10	Ratio, General Administrative Expenses to Net Property Additions and Operation and Maintenance Expenses
1929	$ 550,994.72	$ 149,807.32	$ 700,802.04	$ 41,175.73	5.875%
1930	693,693.13	199,924.45	893,617.58	48,254.81	5.40 %
1931	1,111,945.19	265,481.93	1,377,427.12	44,197.95	3.209%
1932	140,025.34	251,432.72	391,458.06	36,923.18	9.43 %
1933	5,668.50	241,290.24	246,958.74	40,606.50	16.44 %
1934	62,541.73	265,434.33	327,976.06	36,120.92	11.01 %
1935	125,366.65	265,862.69	391,229.34	30,658.03	7.836%
1936	13,553.28	318,417.79	331,971.07	39,529.78	11.907%
1937	109,689.52	349,559.70	459,249.22	44,689.47	9.73 %
1938	88,884.84	341,975.23	430,860.07	47,943.11 (Note B)	10.93 %
1939	15,925.16	352,469.82	368,394.98	50,926.88 (Note C)	13.82 %
Total	$2,918,288.06	$3,001,656.22	$5,919,944.28	$461,026.36	Avg. 7.787%

Notes: (A) Adjusted to include salaries of General Superintendent and Chief Engineer, excluded in Ford, Bacon & Davis, Inc. report.
(B) Includes $2,295.00 legal fees in re rate proceeding.
(C) Includes $7,620.00 legal fees in re rate proceeding.

The facts are that General Administrative Expenses have gone on pretty much in the same volume, regardless of the volume of construction work in progress, and there is good logic to support the principle that only such part thereof as is specifically incurred for construction purposes should be capitalized.

The Company's mangement exercised its discretion as permitted under the system of accounts in not allocating General Administrative Expenses to construction work performed, and its records and accounts have been examined and audited year after year by members of the auditing department of Standard Oil Company of New Jersey.

The absence of any objections or adjustments concerning these General Administrative Expenses as a result of these periodic audits clearly indicates that the Company's policy in this regard was approved.

It also appears that the basis for the present claim to capitalize Corporate and Engineering Costs is the usual engineering rather than an accounting method, in that it is based upon the ratio of construction expenditures to total expenditures, instead of being based upon the time actually spent in connection with construction work. Such time studies cannot now be made with any reasonable degree of accuracy.

The method used in the determination of this claim very definitely results in the addition to construction costs of an arbitrary percentage to cover assumed overhead costs which is contrary to sound accounting principles in that it does not represent actual plant costs.

Under "Components of Construction Cost" the Federal Power Commission Uniform System of Accounts provides for the inclusion of "Engineering and Supervision" and various other "General Administrative" costs as construction costs, always based on the amount of such costs actually applicable to the construction costs. Under "Overhead Construction Costs" Gas Plant Instruction No. 6(B) reads as follows: "The instructions contained herein shall not be interpreted as permitting the addition to gas plant accounts of arbitrary percentages or amounts to cover assumed overhead costs, but as requiring the assign-

ment to particular jobs and accounts of actual and reasonable overhead costs." (Underscoring added)

Gas Plant Instruction No. 6(C) provides that: "The records supporting the entries for overhead construction costs shall be so kept as to show the total amount of each overhead for each year, the nature and amount of each overhead expenditure charged to each construction work order and to each gas plant account and the bases of distribution of such costs."

Instructions concerning General Officers' and Clerks' Salaries and Expenses During Construction, as contained in the Uniform Classification of Accounts for Natural Gas Companies prescribed by the Public Service Commission of the Commonwealth of Pennsylvania, effective January 1, 1920, read in part as follows:

> "Account No. 259. General Officers and Clerks' Salaries During Construction.
>
> "If the utility is already operating a natural gas system, charge to this account only that proportion of such salaries, that is based upon the time which such officers and clerks actually spend in new construction."
>
> "Account No. 260. General Officers' and Clerks' Expenses During Construction.
>
> "If the utility is already operating a natural gas system, charge to this account only those expenses that are incurred while such officers and clerks are actually engaged on construction work."

The foregoing instructions appear to have been given little, if any, consideration in arriving at the Company's re-accounting with respect to Corporate and Engineering Costs said to be applicable to its plant accounts.

Interest during Construction.

Ford, Bacon & Davis, Inc. Memorandum Report of April 15, 1940 contains the following comment:

> "The Company has capitalized no interest on its construction projects since the completion of the original project. On construction projects, such as pipe line extensions, compressor stations, etc., money is tied up in the uncompleted construction for a considerable per-

iod of time before the project can be operated. During this entire period interest should be charged to construction on all money advanced from the first expenditures on account of the project to the time the project is completed and in full operation.

"The Bureau of Valuation of the Interstate Commerce Commission uses an annual interest rate of 6 per cent, and computes interest for one half the estimated construction period plus three months.

"Having in mind the above principles, and the nature of the construction projects carried on, it is considered that a fair interest charge during construction should be 1.5 per cent of the capital expenditures. No interest has been included on the capital items in the attached schedule heretofore charged to expense."

Customary accounting procedure in connection with computation of Interest During Construction is and always has been to ignore such computations for relatively small jobs and for jobs of which the construction period is approximately 30 to 60 days. Computations are based on monthly expenditures by individual jobs and the interest costs resulting from the computations are assigned to the individual jobs.

As is true of other items in this re-accounting, the Company's management exercised its discretion as permitted under the system of accounts used in not assigning interest costs to construction work. This omission continued throughout the years of operation and, although the Company's records and accounts have been subject to audit annually, no objection to this policy has been found in the Company's records.

Some confusion existed in connection with the capitalization of interest shortly after the original construction period in 1928, as is apparent from various entries made in connection therewith. The last paragraph of the following telegram from Mr. J. B. Luse to Mr. E. G. Hill, dated March 6, 1929, attached to the Company's voucher M-258, December, 1928, states the management's policy at that time, which policy has been adhered to consistently ever since as regards its policy of expensing versus capitalizing various items.

"Tentative income tax would indicate thirty six thousand dollars Stop Last fall Messrs. Payne Von-Phul Luse agreed to make no depreciation for year assuming earnings would be small now suggest you include five percent depreciation for three months on depreciable property which would approximate one hundred thousand dollars charged to expenses Stop Also suggest we include interest on bonds to September thirtieth be charged to operations leaving only interest on borrowed funds as interest during construction Stop To eliminate bonds interest September thirtieth will mean you reduce this account and charge New York office we in turn will credit field office and charge bond interest expense Stop Think you appreciate three stockholders would prefer this saving than to show large earnings."

As one of the "Components of Construction Cost" Gas Plant Instruction No. 5 (17) of the Federal Power Commission Uniform System of Accounts permits the charging of Interest During Construction on the following basis: "'Interest during construction' includes the net cost of borrowed funds used for construction purposes and a reasonable rate upon the utility's own funds when so used. Interest during construction shall be charged to the individual job upon which the funds are expended and shall be credited to Account 536, Interest Charged to Construction—Cr. The period for which interest may be capitalized shall be limited to the period of construction. No interest charges shall be included in these accounts upon expenditures for construction projects which have been abandoned."

The method used by Ford, Bacon & Davis, Inc. for computation of Interest During Construction is definitely not in accordance with this instruction.

From the facts recited above, it is obvious that the omission of allocations of General Administrative Expenses and Interest Expenses to Construction Work in Progress was not because of accounting errors, but due to the policy of the Company's mangement. It is, therefore, not a correction of accounting errors to now re-account for such items by including a portion thereof in plant accounts.

Such re-accounting, in my opinion, is simply a means of inflating the plant accounts.

[Testimony of CARL H. SCHUTTE, continued.]

Q. Mr. Schutte, in connection with the Exhibits 195 and 196 which are rebuttal exhibits with respect to the items which Canadian River and Colorado Interstate have changed from expense to capital items in accordance with exhibits by Mr. Lusk, Exhibit 67 I think it is, you prepared these two Exhibits 195 and 196?

A. Yes, sir.

Q. I'd like first to discuss the question of overhead costs and undistributed construction costs which is related to both exhibits. I think the same principle is involved in both.

A. That is correct.

Q. As I recall your testimony on direct examination with respect to your own Exhibit 139 in which you had made an examination and prepared the reclassification for capital accounts for the company, I take it then you stated you were proceeding from an accounting viewpoint and doing that on accounting principles?

A. Yes, sir.

Q. And is that true of the work you have done here; that is, you are applying accounting principles as the items referred to in Mr. Lusk's exhibit?

A. Yes, sir.

Q. And I think at that time you stated you didn't pretend to be a rate case expert.

A. That's right.

Q. Entirely an accounting examination you have made, and that is true of this?

A. That is correct.

Q. And I assume that if these portions of general and administrative expense and the items of interest during construction had actually been charged by these two companies to capital account as a part of the cost of the respective items of property when these items were put into use, you would make no change now?

A. You are discussing which, Mr. Dougherty? 195 or 196?

Q. Well, I assume the same principles would apply. I don't know that it makes much difference, but we can take

195 first, but I am speaking solely of that portion of 196 that relates to undistributed construction costs.

A. Oh.

Q. That subject matter seems to be the same in both exhibits.

A. That is correct. You are speaking of interest during construction and that portion of the management overhead?

Q. Yes, the two items; that is, the portion of general administrative expense which is designated in here in your exhibits, both as corporate and engineering cost, and then that portion, interest during construction.

A. In so far as those two items are concerned, it would depend entirely on what basis they are capitalized on as to whether I would have permitted them to remain or not.

Q. Well, first, you do recognize that those two items are appropriate component parts of capital cost?

A. Properly applied, yes, sir.

Q. And so that if the computation thereof is correct, then such charges should be a part of capital cost?

A. If the computations were correct.

Q. Now take with respect to interest during construction, if the computations as you think were correct had been made by the company at the time and that amount added, then you would make no change in that?

A. That would, as I say, depend on whether they are correctly computed. If they were correctly computed and the amounts appeared to be reasonable, the chances are they would have remained so.

Q. Now, where do you draw the line between discretion of the company in exercising judgment of the accounting officers about methods of computing interest and whether it is to be charged or not as distinguished from what you would call an incorrect computation of interest which would justify you in making a change, although you think that the company should make no change?

A. Well, it would primarily be dependent upon the base. Interest should be, if properly done, based on the individual job and only for the period of construction and then there shouldn't be a delayed or deferred period within that. In other words, if you were to start constructing a piece of property and for some reason or other broke the continuity

of the work, during that period of the break you wouldn't charge interest. That would be one thing. Small jobs normally have not been charged with interest during construction in any case that I know of. Usually the company sets a minimum amount for a job on which they are going to charge interest and another would be the length of time required to complete a construction job.

In other words, you might spend thousands of dollars all within a 15-day period, and in that event you normally wouldn't charge interest during construction.

Q. Well, where is it that you draw the line on one side of which you say the company has discretion to do certain things and on the other side it has not? By that I mean this: Is your line of discretion limited solely as to whether the company shall or shall not charge interest and then if it does charge it, you don't think that it is bound by the discretionary judgment it has exercised and you are not bound by it either?

A. I don't quite get that question, Mr. Dougherty.

Q. Well, you speak in your exhibits about the company having exercised its discretion about charging interest during construction and if it had, as it did, not charged interest during construction, then under your opinion it exercises discretion and now should not be permitted to set that up on its books?

A. That's right.

Q. Now, you recognize the discretion of the company with respect to that fact?

A. Oh, yes.

Q. But I take it you don't recognize that the company has any discretion as to the method of charging interest which is now binding on both the Power Commission and the company?

A. Well, their discretion would be limited to a reasonable and just amount.

Q. In respect to the size of jobs and things of that sort, would you recognize that the company might have had any discretion as to how large a job had to be before interest could be charged?

A. Well, only from the standpoint of what would be normal accounting procedure, is all I had in mind there.

Q. Well, as I get it, in your examination of any interest

during construction that was charged, you feel that you should go back and determine the correctness of the methods and of the amounts in your own judgment and that you aren't bound by any discretion the company might have exercised at the time it made the charge?

A. You say I would go back and correct it?

Q. Yes.

A. No, I don't think so. I think I would point out what they had done and what in my judgment would have been a preferable thing to do. I wouldn't say that they shouldn't do a certain thing.

Q. Well, then, with respect to interest during construction your objection here is, I take it, that because the company did not charge it at the time, it now should not be permitted to set it upon its books?

A. That is the premise, yes, sir.

Q. Now, I understand from what you say in your exhibit, too, that it is your understanding that whether or not interest during construction should be included in capital costs was a matter of discretion, is that correct?

A. You said in Exhibit 2.

Q. In both exhibits again with respect to interest during construction.

A. Will you point out about where that particular item is?

Q. On Page 3 of this statement which you read with respect to 195, you make the statement in that with respect to Canadian River Gas Company that the company's management exercised its discretion as permitted under the system of accounts in consistently omitting the allocation of corporate and engineering costs to construction work performed, and then with respect to interest during construction you again on Page 5 of that same statement say that the company's management exercised its discretion as permitted under the system of accounts in not assigning interest costs and the same thing is true in Exhibit 196 on Page 53. You make that statement with respect to interest during construction.

A. Yes, sir. Now, what was the question?

Q. The question is, is it your interpretation of the Federal Power Commission Code that the matter of adding interest during construction into the capital cost of property

is a matter that is within the discretion of the company; that is, whether it shall or shall not put it in?

A. I think so.

Q. The instruction which you referred to, Plant Instruction 5, which is headed "Components of Construction Costs," reads this way: "The cost of construction properly includible in the gas plant account shall include where applicable the direct and overhead costs as listed and defined hereunder."

Then No. 12 is General Administration Capitalized; No. 17 is Interest During Construction. Now, under your interpretation of the verbs there "shall include," is not that mandatory?

A. I take it is permissible but not compulsory.

Q. Would that be the same conclusion with respect to the other items that are components of construction cost? I am reading from Page 39 of the printed Uniform System of Accounts.

A. There would be quite a number of items coming under Components of Construction Cost and there might be a difference of opinion about whether they should be capitalized or otherwise. In other words, I think the company has the discretion of capitalizing certain items or expensing them or treating them or disposing of them in some other manner than capitalizing them.

Q. There is no language in Instruction 5 that indicates, as I see it, that any of those items—all the way from 1 to 17—may or may not be included, and as I see it, there is no distinction between the reasons you might give for these overheads and other items that are contained there, and if there are any, I wish you would point those out.

A. I think you are correct in that. The components of construction costs, No. 5, says: "The cost of construction properly includable in gas plant account shall include where applicable the direct and overhead cost."

As to overhead costs, however, they base them always on the cost applicable to the particular job. From the standpoint of labor, as I interpret it, it is presumed to mean the supervising officials—I don't mean the construction officials, but I mean the company's administrative officials—devote to the specific things, and in that particular instance I think the company has a discretion of whether it wishes to

capitalize those particular things or not. If it does capitalize them, the basis should be, of course, the time spent on the jobs.

Q. Well, there is a distinction, of course, as to whether you shall or whether you shall not capitalize them and then whether the amount you capitalize is accurately determined, isn't that correct?

A. I think so.

Q. There are two other questions there and I wonder what your interpretation was based upon in saying the company had discretion about making any charge for overhead when the language apparently is mandatory. I believe there is no language there that you know of, is there, that makes any distinction in Instruction 5 as to inclusion of those two items as against, for example, labor, materials and supplies?

A. That is right.

Q. That is one of these interpretations made outside the specific language of the Code?

A. That is correct.

Q. Now, the same sort of language is used in the Pennsylvania Code of 1920, is it not?

A. More or less similar, yes, sir.

Q. So that in order to determine that the failure to include interest during construction in general overhead was not a mistake; you have to arrive at the interpretation, namely, that it is discretionary even though the language in the instruction is mandatory?

A. (No response.)

Q. I don't know whether you thought I was making a statement or asking a question.

A. I thought you were making a statement.

Q. Do you agree with it or don't you agree with it?

A. Will you read that back to me, please?

(The question referred to was read by the reporter, as set forth above.)

The Witness: As to the corporate overheads the Pennsylvania Code on Page 59, speaking of general officers' and clerks' salaries during construction says: "To charge to this account the salaries of executives and general officers and general office clerks that accrue during construction, and if the utility is already operating a natural gas system,

charge to this account only that proportion of such salaries as based upon the time that such officers and clerks actually spend in actual construction."

It was my interpretation in connection with that that the amount of time was not possible of determination. That was one of my reasons for handling that particular item in the manner I did.

In so far as the interest during construction was concerned, the Colorado Interstate Gas Company appeared to be somewhat confused as to what they wanted to do in the beginning; in fact, they initially charged to interest a greater amount than remains there and subsequently credited that particular interest account, and *threw* that interest that was credited back to operations and that appeared to have been based upon a telegram they received from Mr. Luce which as I interpreted it was an expression of the company's policy at that particular time.

Q. Well, you are speaking now of the interest with respect to initial construction in this last statement you made?

A. Well, I think that the telegram would indicate the policy from that time on.

Q. Quite so, and as a matter of fact, the company didn't charge interest on subsequent additions.

A. That is correct.

Q. What I am trying to get divided in this question is between interest that should be charged as a part of the capital expense as distinguished from whether you computed it correctly. As I read these codes, both of them, the language is not permissive and it would seem that the company had not followed the provisions of the Pennsylvania Code, if applicable, in failing to include interest. Do you agree with that interpretation?

A. I agree they could have included interest had they chosen.

Q. So, as I asked a while ago, your interpretation of that code, the Pennsylvania Code as well as the present FPC Code, is that there is a matter of discretion there even though the language is mandatory?

A. Well, I don't entirely agree that the language is mandatory.

Q. It says "shall charge."

A. I have heard Mr. Lusk interpret "shall" wasn't mandatory.

Q. Will you accept his authority on all items?

A. No, I unfortunately wouldn't, but nevertheless, I still can't agree that the charging of interest and overheads to construction is mandatory because in a good many lines of business it isn't done at all.

Q. Well, I am speaking solely with respect to the codes.

A. I appreciate that, but I am speaking from the accounting standpoint for that particular charge.

Q. It would be your interpretation of the FPC Code in the future this company could or could not charge interest during construction as it saw fit?

A. I would think so, yes, sir.

Q. And if it decided not to do so, you would not think it had violated Instruction 5 of the Gas Plant Account?

A. That is correct.

Q. It is that interpretation which you make that forms the basis of your conclusion that it was a discretionary matter? It is your interpretation of that portion of the Code that caused you to say that the charges of these items of overhead was a discretionary matter?

A. I think that is correct.

Q. Beyond that you object to the method which Mr. Lusk used in assigning some part of the general administrative expense as corporate and engineering overhead?

A. Yes, sir.

Q. The manner or method which he used really is one that assumes that the general administrative supervision and work is expended in proportion to the dollars spent either on new construction or on operating expense?

A. That is as I understand it, yes, sir.

Q. So if in any particular year there had been an equal number of dollars spent for property additions and the same number of dollars in the operating and maintenance expense, that theory is the time spent by the general administrative officers and clerks and so forth would be equally spent on construction and on supervising of operations?

A. Based upon the way you made that statement, yes.

Q. It is using the dollar basis as the method of allocation?

A. That is right.

Q. Now, aren't you in error when you say that is assuming an arbitrary percentage?

A. I don't think so.

Q. Isn't an arbitrary percentage one that you would sit down and say, "I will take any number from 1 to 10 and decide 3 per cent might be appropriate and charge it that way"?

A. That, too, would be arbitrary.

Q. But when you use dollars as the measure you still think that is arbitrary?

A. In this instance I do, yes, because even though you might have $500 capital; $500 expense, that is no reason to assume you would have used an equal amount of time of the executive officers on each item.

Q. There is considerable opinion that is a proper basis for allocation, isn't there, Mr. Schutte?

A. It has been so stated, I believe, yes, but that doesn't necessarily mean one has to follow it.

Q. Oh, no. I suppose that might be true about your opinion of some of these things?

A. That is right.

Q. What I had in mind was this; that this isn't the first time that the method of allocating general administrative expense on the basis of dollars as between neutral construction and operating expense has been used?

A. No. It is often used and some of it as it is used is questioned.

Q. I think you told me at the beginning that accounting is not an exact science and there is a lot of difference in opinion.

A. That is correct.

Q. You do, of course, use dollars when you come to dividing overheads for initial construction?

A. Not as a general thing, Mr. Dougherty, if I understand you correctly. Your initial construction as I understand it, presumes to be prior to the start of operation.

Q. That is right.

A. In that case I would say it is all construction.

Q. But the method of allocating these overhead expenses to the various parts of the plant, that is, to production and to transportation and to so forth, is done on a dollar basis?

A. Quite often, yes, sir.

Q. And that is the way you did it in Exhibit No. 139?

A. No, I don't think I did. The thing I did—I think I accepted what the company did because it didn't particularly matter whether I used it on a dollar basis or some other basis.

Q. You remember with respect to the transmission lines the overhead had been spread by the company on a mileage basis?

A. That is right.

Q. And you said that wasn't an equitable method and it should be done on a dollar basis?

A. Because there was not any other basis that was more equitable. When computed on a mileage basis it gave the same rate on a 4-inch line as it would on a 16-inch line, so that isn't equitable.

Q. So you didn't leave it as the company accepted it and did charge it and placed it on a dollar basis?

A. In totals I made no change; in the instance of that classification, yes, I made a change.

Q. So at any rate you felt with respect to initial construction in dividing the expense between different parts of the system, the dollars in those different parts was the most equitable manner you could find or devise?

A. Yes, because I didn't have available any other method of doing it. In other words, there wasn't a time study available, which would probably be the best method of doing it.

Q. That is true here, there is no time study record available here.

A. That is right.

Q. So for that reason you indicated the use of dollars as an arbitrary method?

A. In this case it is the difference between operation and capital and in the other it was the difference between one capital account and another.

Q. With respect to the construction of the transmission line it is entirely possible that the time spent on supervising construction of these laterals of smaller size might have been disproportionate to the actual dollars invested?

A. That is possible.

Q. Because you got a certain amount of basic work when you ran a lateral, whether it was an 8-inch or 10-inch line?

A. That is correct.

Q. In the absence of any information about that, it was

your determination that miles would not reflect the most equitable method?

A. I felt that the dollar basis was more equitable than the mileage basis.

Q. Although it might be possible mileage might have a closer relationship to time to some extent than dollars?

A. Oh, it is possible but not probable.

Q. But at any rate, dollars were all right there, but you don't think they are appropriate for this division between new construction and operating expense?

A. No; because as I said before, the one was merely within fixed capital accounts and it didn't matter too much whether it was in one fixed capital account or another, but that doesn't hold true when it is a matter as to allocating certain charges to surplus or to fixed capital.

Q. Is it your interpretation of the plant instruction 6 that the only way you can arrive at an equitable distributior of these overheads between appropriate charge to operating expense and capital is on a time basis?

A. That is pretty much so, yes, sir.

Q. I assume that the importance of some of the supervision of construction would be different in some particular types of construction than others?

A. I don't think so. My interpretation of that particular instruction is after you are in operation you are going to have to operate regardless, and the construction work added is more or less incidental; that is to say, it fluctuates very much from year to year. In order to get an equitable method of allocating these overhead charges to construction, the time basis is the most equitable manner in doing it.

Q. That disregards whether or not the importance of different construction jobs vary and require a different class of supervision or attention than do others? It assumes everything is on an average basis and purely a matter of time spent?

A. If you had a more important construction job, the probability would be that you would spend more time on it.

Q. And that probably would have some relation to the dollars, that is, the more dollars spent the greater amount of time that would have to be spent on it?

A. That would be entirely likely, yes.

Q. I think Mr. Lusk on his method for Canadian River over the whole period assigned about ten per cent of the

general administrative expense to these overheads for inclusion in capital account. You state on Page 1 of this statement that the basis of Exhibit 195 was to capitalize $98,052.70 of the total general expense of $930,077, so that is just a little better than ten per cent?

A. That is right.

Q. I think you had in mind Canadian River during that period of time had expended some three or more millions of dollars in new construction?

A. I have forgotten what the figure was. I don't think I have that figure available. I wasn't so much worried about the total amount he was capitalizing, it was the method he was using and the fact that the company hadn't done it from the beginning. That fixed capital additions net seems to run about $3,100,000.

Q. Ten per cent of the time of general office clerks and accountants and supervision of manager and various assistants to the extent of ten per cent doesn't seem to be out of line for that much construction, does it?

A. You have to keep in mind at that particular time they had both engineering and management contracts and the management contract wouldn't be presumed to include supervision of construction. The engineering contract would do that, so possibly the figures we are discussing are quite on that basis.

Q. As I understand it, these figures of $930,077 do not include any of those Ford, Bacon & Davis, Inc. fees except some portion that might have been considered as a salary of Mr. Trelease?

A. Well, then, we would run a greater percentage of the clerks' salaries, wouldn't we?

Q. What I had in mind was this: As I understand it, the $930,077 is a general administrative expense of Canadian River Gas Company, during the time, excluding the amounts paid Ford, Bacon & Davis, Inc.; that is, when Mr. Lusk took his computation he took out the management fees paid Ford, Bacon & Davis, Inc. and took out the engineering fees paid them, so he was computing it purely on a basis of the general expense of the company.

A. I believe that is right.

Q. So as I say, ten per cent of the time doesn't seem like an exorbitant amount of time having in mind the capital additions?

A. Oh, I wouldn't think it would be particularly exorbitant.

Q. As I take it, you are objecting to the fact we have to estimate them and can't compute them exactly on a time schedule basis; that is, not only that but the question of the amount is your principal objection there?

A. The basis of computation and the fact that the company didn't charge them initially.

Q. Well, now, do you have in mind any basis of computation that might be made in the absence of time sheets kept by each of these men and each of the clerks that are involved?

A. You mean as of this date to make it retroactive?

Q. No, any way. How could we do it in the future? Time study is the only manner in which you can make an assignment of a portion of general administrative expense.

A. I don't know any way of doing it equitably except on a time basis.

Q. Many things are in here in connection with this code of accounts in determining costs in the past that have to be estimated. For example, the code says itself that the original cost when first devoted to public service is to be estimated if not known.

A. That is right.

Q. And that would be true even of cost on the company's books of construction by it if there had been any failure to accurately keep your accounts between different types of property?

A. I think so.

Q. You are supposed to go back and make these estimates, are you not?

A. That is correct.

Q. Why couldn't estimates be made in a case like this?

A. You mean to make them retroactive, or from now on?

Q. I am speaking now of arriving at the amount. There are two problems here, Mr. Schutte. One is your opinion they should not be added here because the company did not add them originally, and the second objection is that there is no acceptable way of computing what part of those general administrative expenses could be added. I am trying to get the thing into its component parts. Assume just for the moment for the purpose of my question that we could add them in retroactively. Why couldn't we make

a reasonable estimate of the appropriate amounts of those overheads to be charged into capital just as the companies are required to make estimates as to original cost of other physical items?

A. Well, I don't know how to answer that question because since my interpretation is they can't do it retroactively, I had never considered the basis for doing it.

Q. Let's take in the future. What method would you say could be used to estimate the appropriate amount of those overheads in the absence of all time records?

A. Well, I still think the time records would be the most equitable way.

Q. And if you didn't keep those, then there is no way of arriving at the amount that could be properly charged?

A. Well, when I say "time records" for the executives that is an estimate in the first place, because I have never seen one that would keep a time record.

Q. So essentially, even currently, you don't anticipate every time the superintendent would go out and look at a well that is being drilled he marks down in his notebook the time he arrived there and the time he left?

A. What would probably happen, as I see it, and from experience, would be he would tell his secretary at the end of the day "I spent about so many hours going out to such and such a place."

Q. So even under the most acceptable procedure of keeping some time records there is bound to be a considerable amount of estimating?

A. From the standpoint of the executive, yes.

Q. That is right. Of course, when that answer is given, then, from the standpoint of the accountant he takes it?

A. He has no choice.

Q. Is there any doubt in your mind that during this period of years in Canadian River's operation, Mr. Ford who is the Superintendent down there, and Mr. Watson, both spent considerable amounts of time looking after the drilling of wells and construction of gathering lines and those other facilities in the field?

A. No, I don't have any doubt whatever but what they spent considerable time in the field, that there would be someone spotting the wells, but as I understand it, a lot of the wells were spotted by members of the engineering division at Amarillo who charged their time to the construction cost.

Q. Well, of course what I am speaking of is the general supervision by the superintendent and assistant superintendent over those matters and observing the wells when they were being drilled by contractors.

A. They undoubtedly spent time on that, yes.

Q. So that there was actually an expenditure of money through payments of salaries and expenses that did not get into the books with respect to the cost of those wells?

A. In so far as salary, I think you are correct; in so far as expenses are concerned, a good many of those could be definitely assigned to specific jobs and I believe were charged there. Of course there was some general expense that wasn't.

Q. The result is there was an actual cost incurred to the company in drilling those wells that is not reflected in their books or in their property account now?

A. I would think so, yes.

Q. Even though it is so, it is your interpretation of the accounting rules under which the company operated and the FPC, that no change should now be made in those accounts to reflect that actual cost was not on the books?

A. You couldn't reflect the actual cost so you would have to reflect an estimated cost.

Q. I agree with you. There is a distinction, I take it, between what the FPC Code defines as book cost and what it defines as cost?

A. I believe so.

Q. I notice definition 6, which is book cost, states: "The amount at which property is recorded in those accounts without deductions for related reserves in other accounts;" definition No. 10, cost, says: "The amount of money actually paid for property or services."

Do you agree with the way I understand that, that the cost would be what was actually expended to bring the property into the property account, and the book cost would be the dollars that the plant account reflects?

A. That is right.

Q. Now, then, Mr. Schutte, if you will go to Exhibit 196, to the various detailed items.

A. All right.

Q. As I have read this over, I think you highly approve of the accounting procedure that was followed by the company with respect to every single one of these items?

A. Not necessarily.

Q. I gathered that you thought the expensing of all of these items was the appropriate thing to do.

A. I felt the company was justified in expensing them.

Q. There might be some of them which you thought would of necessity have to be expensed?

A. That is right.

Q. And some of them which might have been either capitalized or expensed if the management desired?

A. That is right.

Q. Now, with respect to the first item, "Flood and Washout Control," under which category does that come?

A. I think that was proper accounting procedure in that case.

Q. Now, I notice in the FPC Code that one of the items under Instruction 10, Page 45, Structures and Improvements, and then on Page 46 one of the items of cost was drainage and sewage systems. Isn't that, after all, what was done here, to merely construct a drainage system; instead of putting in tile drains they simply cut ditches and spillways and did other things to drain the right of way?

A. Oh, that might have been a part of it, but it wasn't all of it.

Q. Well, all of the things mentioned here in the explanation of Ford, Bacon & Davis referred to taking care of surface water?

A. That is correct, but it likewise took care of terracing, not on the right of way.

Q. Well, is it your understanding that drainage system to be properly included in capital account of the company would have to be constructed on its own right of way?

A. Not altogether. If that were done during the course of initial construction, I would look at it from one angle. If it was done eight or ten years after construction, I would look at it from an entirely different angle.

Q. Of course, none of this work could be done on adjoining land without the consent of the land owner?

A. That's true.

Q. And, therefore, the company had some rights to do the work and maintain the work there?

A. That's right.

Q. So that while it wasn't its pipe line right of way, they undoubtedly had some sort of an easement or some right?

A. They probably had a verbal right.

Q. They weren't trespassers?

A. No.

Q. What is the distinction between putting in a drainage system at the beginning of construction when the line is first built and then putting in a drainage system when later you discover that you need it? What is the difference between those two?

A. Well, I think putting in these ditches and spillways and what-not was a matter of maintenance rather than adding to the plant account.

Q. I know that is your conclusion, but you made the statement that a drainage system put in at the beginning would be a part of the plant, and if you put one in later it wouldn't. Now, I see nothing in the Federal Power Commission Code that makes distinction as to time when it is put in, and I wanted your explanation of that.

A. I don't think there is anything in the Federal Power Commission Code that would say that. The fact of the matter is, as I see, if that were being done in the initial construction you wouldn't be able to ferret it out to save your soul. When it is done afterwards—in that case it would be a part of the initial construction and you would have an undetermined cost in there that you had not been able to specifically up.

However, when you do it subsequently, and you are able to get the information as to what was done, I don't see how you can consider it anything but maintenance.

Q. Of course, it performs the same service whenever done and performs the same service as any system of drainage pipes might perform or any type of structure that would keep water off the right of way as far as its utilization is concerned?

A. It might, yes.

Q. All right, now, the next one, starting with rock weighting. Now, which category does that come in?

A. The same as the first one.

Q. That is, that could only be maintenance?

A. Yes, sir. I wouldn't say "only." I think I would say "preferably," maintenance.

Q. Well, would this be an item that, had the company capitalized, you would not have gone back and removed it from capital and put it into expense?

A. If they had capitalized the costs as they were incurred, I think I would have questioned it in any event.

Q. You would have questioned it?

A. Yes, sir. If that had been done at the time of initial construction it would have been capitalized, of course.

Q. Well, many of these things in connection with the right of way, Mr. Schutte, are done when the necessity arises, isn't that correct?

A. Well, I don't think that would necessarily be true in the case of rock weighting.

Q. What do you understand by rock weighting?

A. Well, in the first place, your line is put in and the back-fill is put in on the pipe without tamping it in any way shape or form. In other words, it wasn't flooded or tamped. It was just put in there loose. Of necessity your erosion over a 10-year period would give you a bit of a ditch there. It couldn't do anything else, so you would naturally put something on there, whether rock or dirt, and from my inspection of the tickets that appeared to be to a great extent what was done here.

Q. Well, a good deal of this was rock put on top of the right of way there where there had not been any settling of the back-fill, wasn't it?

A. You couldn't tell that from the tickets.

Q. I see. And you didn't make any check outside or inquiry?

A. I made inquiries, yes, sir.

Q. And did that disclose that it was mainly put in the holes in the back-fill?

A. I wasn't able to determine, sir.

Q. Do you know that Ford, Bacon & Davis say in their explanation that rock weighting is not to be confused with filling up of gaps and holes in the back-fill?

A. Yes, sir, and I wondered how they were able to get that explanation because I wasn't able to get it.

Q. This helps to hold the line down in case of washouts?

A. Yes, sir.

Q. And prevents the line from floating away or breaking? That is what would happen if you didn't.

A. Yes, sir.

Q. It accomplishes the same thing, does it not, Mr. Schutte, as when the line was originally constructed or now, if you poured concrete on certain portions on it to hold it

down or put heavy clamps on it just like on river crossings you put heavy clamps to hold it down?

A. Well, I am not qualified to make a statement on that.

Q. Now, had that been done, though, in the initial construction you would have thought it should have been capitalized?

A. If it had been in the initial construction, it would have been in the back-filling costs and you would never have been able to determine it.

Q. You consider that doing this is not a betterment to the line in that it makes it more efficient and useful and prevents it from breaking?

A. I don't think it has added anything to the physical value of the line, no, sir.

Q. Now, what about No. 5—cattle guards? Which category is that?

A. Well, that was a questionable item. Those cattle guards might have been put in in the beginning and had that been done they probably would have been made of new material. Very likely you wouldn't have been able to determine the cost. What actually happened here is that this is primarily the cost of labor and trucking, very little for material, and when you capitalized the cost of labor and trucking expenses without having any material costs for this type of item, it is questionable.

Q. Well, there is nothing in the Federal Power Commission Code that says you can't capitalize work done just because the material didn't cost very much, does it?

A. No, sir. That is from an accounting standpoint.

Q. You only capitalize labor if the material has some determinable value or some substantial value?

A. No, I wouldn't say that but I still think it would be questionable to capitalize it.

Q. You mention here that scrap materials have been used. If they had gone over to the Colorado Fuel & Iron and bought some brand new rails and spent considerable money for them, then you would think that it might be capitalized?

A. If the company capitalized it as the work was done, yes.

Q. If this type of thing were done, now—that is, wherever cattle guards have to be installed—would you consider them properly capital items?

A. That would depend on how they went about it. I want to be able to spot each one of them for one thing, which wasn't possible with the information I had. In other words, I would want them to put it up to record such costs on the basis that they can retire them if it were necessary.

Q. Well, what you are complaining about in many respects here is the absence of refinements in accounting methods employed by the company, isn't that true?

A. To a great extent.

Q. And, of course, during the period of years when this was done there was no regulatory body having jurisdiction over the company which had prescribed any code of accounts for them?

A. That is correct.

Q. It was a matter pretty much of running it as they decided themselves?

A. As they saw fit. In other words, it was their discretion.

Q. Yes, so that there wouldn't be possible as many refinements of accounting carried into effect under such a condition as undoubtedly will be when the company conforms to the Federal Power Commission code?

A. That is true, Mr. Dougherty, but nevertheless, from an accounting standpoint if a company were to capitalize certain items it certainly should have adequate supporting information and that is lacking in many instances here.

Q. Well, the supporting information apparently would be adequate maybe to the company but not to an auditor or some regulatory authority?

A. No, I wouldn't think it was even adequate for the company to capitalize them. I think that based on the information that was supplied the accounting department, they had very little choice but to expense the item.

Q. Well, the cattle guards aren't located so that you can go out and find them?

A. You could probably find them, but you couldn't tell when they were put in or how much they cost.

Q. The figures that Ford, Bacon & Davis have assembled here, did you check those against the company records, the job tickets, and so forth?

A. I checked the time tickets and trucking tickets—not all of them, but we made a very thorough test check.

Q. And you couldn't substantiate the figures that Ford, Bacon & Davis have assembled?

A. We could substantiate most of the figures all right, yes, sir.

Q. But you couldn't locate the property that was represented by the figures?

A. Well, I didn't make any attempt to locate the cattle guards other than note that on the time tickets and trucking tickets that the locations weren't mentioned. In other words, what I am trying to say is, I didn't go out and make a physical inspection to see where they were.

Q. But, now, with respect to No. 4, Bridges, which category is that?

A. I think the company's original accounting is correct.

Q. Now, these were bridges, some of them on the company's right of way and some of them public bridges?

A. Primarily public bridges.

Q. There you think that because the bridges weren't solely owned by the company that it would not be appropriate to include any part of that expenditure in capital account?

A. I consider that as a contribution in the aid of construction of the bridges in which the company has no equity whatever except as a tax payer in that specific area.

Q. Did you find out that the purpose of doing that was to avoid constructing bridges by the company itself along its right of way?

A. Yes, I understood that.

Q. And if the same amount of money had been spent in constructing any type of a bridge along its right of way over this same creek, then you would have included it in capital account?

A. The company probably would have capitalized it in that case and I think I would have agreed with them, yes, sir.

Q. The other portions of it to represent bridge costs on the company's right of way, do they not?

A. I don't know just what they represent. I wasn't able to locate those items.

Q. I see. Well, your difficulty there, then, is that you didn't feel that they were substantiated rather than you don't believe that bridges are a proper capital item?

A. Oh, I would believe that the bridges would be capital items based on being able to put them up in retirement units.

Q. Well, as I understand your last statement, you think

that the company's books should be kept so that the retirement units are clearly defined?

A. That's right.

Q. And that again is a refinement of accounting that probably wasn't engaged in by the company during its past years?

A. Well, let me make this statement, Mr. Dougherty, which will probably straighten us out on that: So long as you are expensing certain items you don't go into the refinement. You would if you were going to capitalize them.

Q. And you think that might have had something to do with the inadequacy of the company's books on retirement units with these various things?

A. I am sure it did.

Q. Now, with respect to Item 5, all this work done on river crossings where riprapping was done and revetments put in, in which category do you place that?

A. I think the company handled that correctly.

Q. Would that be work that could be capitalized if all of the records were kept to satisfy your requirements?

A. Some of it might; some not.

Q. Well, now, a good part of this consists of putting in a considerable amount of materials such as rails, concrete, and brush, trees, for the purpose of preventing washouts, isn't that correct?

A. For the purpose of repairing prior erosion and to prevent washouts.

Q. Well, whatever had been done was not previously in capital account; that is, I mean the land that was erroded was not a part of the capital account of the company?

A. That's right.

Q. So that these installations of piling and heavy rails and concrete was the first time that that type of construction had been made at these river crossings?

A. I think that is correct.

Q. Now, there is no question but what if that had been done in the first instance when the line was first built you would have approved its capitalization?

A. I think the biggest part of it possibly would have been, because at that time you wouldn't have had the erosion to worry about that occurred after the installation of the pipe line.

Q. Well, is it your opinion that where a river crossing

is given this treatment of building these revetments and concrete abutments for the purpose of preventing washouts, that whether it should be a capital item or not depends upon whether there has been some washing away of the banks previously?

A. Not entirely.

Q. It is a construction that can be found there, of course?

A. It has been my understanding that that type of work has, I mean when it is done after the initial installation of a pipe line, has been generally considered by the gas industry as maintenance cost.

Q. And you believe that in the future any work of that sort should likewise be expensed?

A. It would depend on the individual case. I wouldn't want to say that that would be true in all cases.

Q. Was this a matter that would have been the subject of any discretion at the time by the company? Suppose the company had capitalized particularly these portions where a considerable amount of steel was used? Pile-driving machines were necessary and a lot of concrete and heavy mesh fence. All of that material is there, isn't it?

A. You have in mind particularly Work Order No. 253, $5,764.21?

Q. That's right.

A. That particular job as I understand it was primarily above the right of way. I think the company handled it in the most approved manner from an accounting standpoint.

Q. Is that because the work was not done immediately where the pipe line was that you make that answer?

A. No, not altogether, but my understanding of that item is that there was considerable erosion at that particular point that had to be repaired, as well as to throw the current to the opposite side of the river.

Q. The erosion that was there before was merely the washing away of dirt, wasn't it?

A. Primarily, yes, sir. I suppose so.

Q. And this was putting back a lot of the dirt?

A. Well, you had to put more or less of a retaining wall there in order to hold the dirt.

Q. And it is physically there now. You can find it?

A. I have seen pictures of it, yes, sir.

Q. And if the property were inventoried, certainly that would be something included in its inventory?

A. Without a doubt.

Q. And it does constitute a betterment in the right of way; that is, it does just more than replace the erosion?

A. Well, you would have a pretty difficult time segregating the cost of repairing prior erosion from the cost of the washouts—preventing washouts.

Q. Well, as a matter of fact, Mr. Schutte, it isn't necessary to repair erosion if it doesn't occur right at your pipe line, isn't that correct?

A. That is not my understanding.

Q. What they do this for is to prevent washouts in the future. The company isn't interested in filling in a washout back up the river with dirt, are they?

A. If the dirt is cut out it is liable to take out a portion of the pipe and you will have to make a new river crossing.

Q. That is to prevent further erosion?

A. Yes.

Q. And also to keep the pipe from washing out?

A. That's right.

Q. We don't try to go back and replace the dirt that is washed out?

A. You do, though.

Q. Only in the event that it is required for this particular new construction, isn't that right?

A. Yes, but the new construction does that very thing.

Q. If you put it in the place where the erosion took place?

A. And that is normally done, yes, sir.

Q. Roads and culverts, Item 6. That amount, any discretion could have been exercised on?

A. From the information that I was able to find on the various tickets, I think the company handled that correctly.

Q. A good many of these jobs had to do with widening and improving company roads, did they not?

A. That is the explanation, yes, sir.

Q. You weren't able to get that same information?

A. In a few instances I think the work tickets did say widening of roads. They usually said "build roads" or "build up roads."

Q. Well, what is your distinction between the expensing and capitalizing of money spent on roads?

A. That would be a pretty fine distinction to draw. Most of your cases would have to stand for themselves.

Q. I mean, suppose a road is widened. Do you consider that a betterment or an addition to the road, or do you consider that an operating expense? —a maintenance expense?

A. I think if I were handling the accounting for a company and it had that particular thing come up, I would want work orders so that I could specifically spot that particular piece of road or keep my cost for it. The chances are that I would capitalize it.

Q. Well, again we are getting to a question not as to whether the actual money expended represented a capital cost but whether the company's records would give you enough information on which you could determine that it represented capital.

A. In this particular case I would say that the records were insufficient and incomplete to permit capitalization.

Q. So you wouldn't know whether it was properly a capital account or an expense item?

A. That is right, and for that reason I would expense it.

Q. Your procedure always is to expense in the absence of full information or clear information which shows that it should be capitalized.

A. It is always based on conservatism.

Q. Well, I take it you don't wish to inflate your operating and maintenance expense account any more than you would want to inflate your capital account, do you?

A. It depends entirely on the company, Mr. Dougherty. I have handled items with one company on one basis and on another basis with another company. The same type of item was capitalized in one case and expensed in another case. I was right both times. It depended upon the company's policy.

Q. I take it, though, the fact of cost; that is, whether the cost, the money expended, constituted a capital item or not would be something that could not be changed by the adequacy or inadequacy by records, isn't that true?

A. If your records weren't adequate to permit proper capitalization of an item, you couldn't capitalize it.

Q. And still it might be that the actual expenditure of money did go into a capital item?

A. That is entirely possible, yes; sir.

Q. So that on the basis of the method you are discus-

sing, everything would be expensed unless the records clearly indicated that they properly should be capitalized?

A. Unless it were clearly indicated that it were properly a capital item.

Q. And you wouldn't go outside those records and try to build up that body of information otherwise?

A. Not at this time, no, sir.

Q. What about No. 7, on Page 23 of your exhibit?

A. I don't think there is any doubt but what the company handled that properly.

Q. This is the same rock that was used for rock weighting or the cost of it, I should say?

A. Well, it is similar cost.

Q. I see. You made no other inquiry to attempt to identify this work which you say the tickets—trucking and labor tickets, did not?

A. It was impossible to identify those.

Q. You didn't go back of the information on the tickets?

A. I made verbal inquiries, yes, sir. I did that in all cases.

Q. But you were unable to get any adequate information that would satisfy you as to where it went and what happened?

A. That's right.

Q. Now, about No. 8, Cathodic Protection. Which character of item is that?

A. That is a questionable item.

Q. By that you mean that there is something that the company might properly have capitalized if it desired to do so?

A. I thought so, but I was agreeable to letting it stand in the way the company had recorded it because of the information I was able to obtain.

Q. That is as you discussed it in here, that your understanding is it was of a different type of cathodic protection than that later installed?

A. No, I didn't have that in mind so much as I did the interchange of telegrams between Mr. Hendee and Mr. Lerch.

Q. Well, that is, on that portion of it, that is represented by the Arkansas Valley laterals?

A. I discussed the matter of cathodic protection with

both engineers and accountants and they weren't all of the same mind. Some of them termed it preventive maintenance in that it extended the useful life of the property. From that angle they thought it was definitely—that is, this particular type of cathodic protection was definitely a maintenance item which need not be charged into operations in one year but which could be deferred over a several-year period. Others thought it might be a capital item.

Q. Well, that sounds like it is one of those things on which discretion might have been exercised?

A. That was my idea, yes, sir.

Q. But since the company did charge it to expense, then you feel it should be left there?

A. Yes, sir.

Q. How about Item 9, Profile Maps?

A. Normally, profile maps are necessary in advance of construction. In that case they are termed preliminary engineering expense and very seldom questioned. In fact, I don't know that I have ever heard of them being questioned, but when the profile maps are made some years after the line has been in operation, it seems to me that they are entirely for the purpose of operating and should therefore be charged to operating expenses.

Q. Of course, the maps are a part of the physical property of the company and are there along with all other original maps that were drawn?

A. That is right.

Q. How about No. 10, in what category is that?

A. I think that is properly expensed.

Q. The portion of lowering lines which is that part of the work that would consist of the deepening of the ditch and additional work because of that, would you say that should be expensed or could that be capitalized?

A. I think that should be expensed if it didn't add to the line.

Q. I see. Well, the purpose of that would be to make the line freer from possible washouts, wouldn't it?

A. That might be possible. There would be various other reasons such as changing roads and things of that sort, but the changing in the location of lines, whether lowering or moving them to another location, unless you have increased your capital investment has always been considered as maintenance expense.

Q. That is, you considered the lowering of the line the same as moving it laterally?

A. Yes, sir. In that particular instance one of the items covers a piece of line that the company has since disposed of. That doesn't seem to be in this particular section. There is another one elsewhere—

Q. Well, any new materials involved, any pipe taken out or new pipe put in, that is properly capitalized, isn't it?

A. And it has been, yes, sir.

Q. But you say the labor would not be?

A. That's right.

Q. Now, Item 11, which is referred to as spare parts which the company has accounted for through expense each year, should not those properly be a part of materials and supplies?

A. Yes, sir, until they were used.

Q. In capitalizing them this way, isn't that in substance what is being done with them?

A. No, sir.

Q. In determining the amount of materials and supplies, whichever one of the Power Commission accountants did that, did not include these items in such materials and supplies?

A. That is correct.

Q. And if they were put in there, would you consider that appropriate accounting treatment?

A. I think I said as much here: "The cost of such repair or spare parts as are included in this item may be properly assigned to the supply inventory account if held for use, or to the appropriate maintenance account if immediately used. If included in the supply inventory, such costs are automatically given consideration in connection with the company's working capital requirements."

Q. Now, you have got a lot of miscellaneous items there under 12. Now, I take it that from your comments you think all of those items were properly accounted for by the Company?

A. Preferably accounted for, I should say, yes, sir.

Q. Now, you refer there to Work Order 8, about some expense in connection with Colorado Springs lateral. Now, isn't that properly covered by gas plant instruction 3-C which includes preliminary studies and general expense and engineering and so forth?

A. I didn't so interpret it, Mr. Dougherty, from the character of the expense involved there.

Q. Well, this lateral actually was built later.

A. Yes, sir, but this particular expense from the information that I was able to secure, appeared to be more for the negotiation of the franchise at Colorado Springs than for the lateral itself. It covered primarily hotel bill and entertainment expense which wouldn't have been necessary for preliminary studies of the line.

Q. That is, it would properly go under the account that has to do with organization expense or miscellaneous—well, organization expense?

A. No, I don't think it would belong under expense, and since they didn't get the franchise, I wouldn't think it would belong to 302. However, had they secured a franchise, then I would think 302 would have been correct.

Q. The results, however, whatever they were, the particular property that they did relate to was the service at Colorado Springs which was later taken on?

A. Yes, but not on the same basis.

The Trial Examiner: We will stand in recess for five minutes.

(At this point a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

By Mr. Dougherty:

Q. Mr. Schutte, you have a number of items having to do with drilling water wells at various stations.

A. Yes.

Q. Work Order 101 on Page 37 and Work Order 269 on Page 39 and Work Order 290, that is on Page 43 of your exhibit. Those all are about the same type of work, are they not?

A. Well, the two of them, No. 101 and 269, are both for prospecting at the Canyon compressing station site or adjacent thereto, where 290 is at Travesser Camp. They are all for prospecting, however.

Q. Now, the reason this work was done at Canyon station was because the existing water supply was either proving inadequate or inefficient?

A. Unsatisfactory, I believe is the term they gave it.

Q. Unsatisfactory?

A. Yes.

Q. So in effect they really were prospecting to determine whether the station should still be there or whether it might have to be located some place else?

A. It had not been put up on that basis. That might be the case.

Q. That is, if they had not found finally one of these wells that produced satisfactory water, it is reasonable to assume, isn't it, that they might have had to prospect some place else for another location?

A. Unless they could have made the water satisfactory.

Q. The items which you think should not be capitalized have to do with drilling wells that did not produce water?

A. And were abandoned.

Q. And were abandoned?

A. Yes.

Q. Of course, all of that expense was caused solely by the search for water?

A. I would think so, yes, sir.

Q. And it just depended on how successful they were whether they had to drill three or four or one well?

A. That is right.

Q. Does it represent the total expenditure necessary to get an adequate water supply?

A. Yes, I would think so.

Q. And if all of the wells had had water you would consider them properly capital items?

A. If they had not been abandoned, yes, sir.

Q. It is the abandonment, is that the basis of the expensing?

A. In this instance, primarily, yes, sir.

Q. I think you have stated here, had this all been done in the first instance, that is, before the company got into operation, then it properly should be included as capital?

A. That is my interpretation, yes, sir.

Q. That authorized by the Code?

A. I don't know that that is necessarily authorized by the Code, but it would be on the basis of preliminary engineering studies.

Q. Is your approach to this whole general subject about

the same as it would be if the company had filed its reclassification of its accounts as required by the Federal Power Commission Code and had submitted these various entries as proposed entries to be made and you were called in by the Commission to express your opinion on them?

A. Yes, I think so.

Q. That is, your approach to it is the same as if it were a reclassification proceeding before the Commission?

A. Well, of course, that could take several angles that haven't been given consideration here. This is based on exactly what the company has done. Now, if in the course of an examination for reclassification I were given instructions somewhat similar to those I have had in this instance, I think my approach would be pretty much the same, yes, sir.

Q. Well, I was speaking solely of your comments on entries proposed by the company rather than on any independent investigation of what other items might be reclassified or not.

A. That's right.

Q. So that if the items had been submitted, as I say, as proposed entries by the company, which they intended to capitalize, your study of them and your criticism of them would be the same as you have made here?

A. I think so, yes, sir, pretty generally.

Q. And that again is based on the principle that you follow, that having exercised discretion, then the company should not be permitted to restate its accounts as proposed?

A. That is right.

Mr. Dougherty: That is all.

Mr. Lange: I just have a few questions.

Redirect Examination.

By Mr. Lange:

Q. Mr. Schutte, with reference to your approach to this subject, particularly the items in your Exhibit 196, it specifically refers to interest during construction. As I understand it, you are not at all concerned and were not at all concerned in the preparation of that exhibit and study as to the reasonableness or unreasonableness of the amounts of dollars?

A. That is correct.

Q. In interest during construction it was the method of treatment of the items itself?

A. That's right.

Q. And I will ask you whether your approach was the same in connection with all other construction costs. You weren't interested in the reasonableness of the amounts themselves, or the percentage used by the company?

A. No, it was the principle involved rather than the amounts.

Q. Of course you aren't able to have the information essential to determine whether it was reasonable or unreasonable in amount?

A. That is correct.

Q. Nor were you able to determine in connection with the amount of time that any of the company officials or employes did or did not devote to the property that is being constructed?

A. That's right.

Q. You were asked by Mr. Dougherty whether or not it wouldn't have been reasonable to assume that Mr. Watson or Mr. Ford or both devoted some portion or a considerable portion of their time to construction work. You, of course, don't know whether they did or did not.

A. That's right.

Q. And you would have no way of ascertaining whether they did or did not devote any portion of their time or any of it at all to that?

A. That is correct.

Q. And that same approach is applicable to all overhead construction costs?

A. Yes, sir.

Mr. Lange: I believe that is all.

Mr. Dougherty: I believe that is all.

(Vol. LXXXVII, pp. 13,125-13,180.)

* * * * *

SMITH's Direct and Cross Examination.

By Mr. Lange:

Q. Will you state your name, please?

A. My name is Kenneth L. Smith.

Q. You are presently employed by the Federal Power Commission?

A. Yes, sir.

Q. And you are residing in the City of Denver, Colorado?

A. Yes, sir.

Q. Do you have a statement giving your educational qualifications in the work you are now engaged?

A. Yes, sir.

Q. Would you read that into the record?

A. This is a statement of both education and experience.

Q. These are just your qualifications that you are reading into the record at this time?

A. Yes, sir.

"My name is Kenneth L. Smith. I am employed by the Federal Power Commission in the capacity of Principal Examiner of Accounts.

"I am a member of the Illinois Society of Certified Public Accountants, the American Accounting Association, and Beta Alpha Psi, professional accounting fraternity.

"In June, 1927, I was graduated from the College of Commerce and Business Administration of the University of Illinois with the degree of Bachelor of Science, having specialized while at that school in accounting.

"I am a Certified Public Accountant of the State of Illinois, having passed the required examination in 1930, and in 1937, as the result of graduate study and upon the completion of a thesis, I had the degree of Master of Science conferred upon me by the University of Illinois.

"The major subject of my graduate study was accounting. This graduate work embraced courses having to do with the nature of basic accounting concepts, such as capital, income, revenue, expenses, losses, depreciation, profits and surplus; with the purposes, form and content of accounting reports; with the theory and problems of cost accounting; and with the problems of managing and regulating public utilities.

"Immediately after being graduated from school in 1927 I was employed by F. W. Lafrentz & Company, Certified

Public Accountants, to work in their Chicago office and I continued in their employ for seven years, until August 1934. During the latter years of that employment I served as a senior accountant, in a supervisory capacity.

"While with F. W. Lafrentz & Company I participated in a variety of accounting engagements which included not only the usual balance sheet and detailed audits but a number of special investigations as well.

"Some of these special engagements involved the preparation of income tax returns for public utility company groups and related depreciation studies, examinations made preparatory to financing operations, and examinations made preliminary to the acquisition by public utility companies, of operating properties including natural gas properties.

"My experience with F. W. Lafrentz & Company familiarized me with the practical operations of public utility operating, management, construction, and holding companies for more than half my time with that firm was spent on public utility work, both gas and electric.

"In September 1934 I accepted a position as top senior accountant in the Chicago office of Deloitte, Plender, Griffiths & Company, an international firm of public accountants. I retained that position until June 1936. During this employment I supervised the annual field audits and preparation of accounting reports thereon for several utility, holding and operating companies. This included preparation of consolidated financial statements for groups having both American and foreign subsidiaries. I also supervised the preparation of the accounting sections of registration statements and annual reports filed by utility clients with the Securities and Exchange Commission under the Securities Act and Securities Exchange Act, respectively.

"In addition to the utility work outlined in the foregoing, which occupied by far most of my time during that period of employment, I supervised the annual audits and the preparation of the annual reports of packing houses, finance companies, coal mining companies, and other industrials.

"Effective December 1, 1936 I accepted an appointment

as Principal Examiner of Accounts in the Division of Finance of the Federal Power Commission. I retained that position until September 1938. My principal duties during that period consisted of making studies and drafting reports relating to the accounting and financial aspects of applications filed with the Commission by public utilities and licensees requesting authority for sale, merger, consolidation or other disposition of facilities or issuance of securities. I was also required to attend hearings relating to such applications.

"In addition to the foregoing, I assisted the Chief of the Division of Finance in preparing reports upon statistical studies of the financial characteristics of the electric utility industry in the United States and in preparing reports and charts pertaining to the intercorporate relationships of electric utility and holding companies, and supervised the office audit of annual reports filed by electric utilities.

"From September 1937 to June 1938 I also instructed evening classes in principles of accounting at the Strayer College of Accountancy, Washington, D. C.

"In September 1938 I accepted an appointment as Assistant Professor of Accountancy in the College of Commerce and Business Administration of the University of Illinois. During the ensuing school year I instructed classes in accounting principles and auditing procedure, respectively, carried on research in French accounting literature, and completed an article entitled 'Capital Gains and Losses in Accounting,' which was published in the June 1939 issue of the 'Accounting Review.'

"In June 1939 I resigned from the faculty of the University of Illinois to accept my present position as Principal Examiner of Accounts in the Commission's Division of Accounts. I was immediately assigned to duty in connection with the investigation of Canadian River Gas Company, et al. (Docket G-124)."

(Vol. XXXIII, pp. 4600-4605.)

* * * * *

Q. You are the same Kenneth L. Smith that has heretofore testified in this proceedings?

A. Yes, sir.

Q. You have heretofore testified on accounting matters both with reference to exhibits as well as testimony that has been been presented in these proceedings?

A. Yes, sir.

Q. I will ask you whether in connection with accounting matters you have prepared a written statement giving analysis of the original cost principle from the standpoint of accounting theory?

A. Yes, sir, I have.

Q. Do you have that before you at this time?

A. Yes, sir.

The Trial Examiner: Are you going to have this marked as an exhibit, Mr. Lange:

Mr. Lange: No, he was going to read that into the record, and I will ask him to begin the reading of it at this time.

Mr. Spencer: Mr. Examiner, before he starts to read, I assume it is understood with counsel that I may let him read without interrupting and at the conclusion of his reading I may move to strike all or any part of it.

Mr. Lange: That is perfectly agreeable.

Mr. Spencer: All right. That's all.

The Trial Examiner: Very well, that will be the understanding, Mr. Spencer, and that is the understanding that the Examiner has when they are permitted to go ahead and read these statements without interruption.

The Witness: "The Commission's Division of Accounts, based upon its examination of the accounts and records of Canadian River Gas Company, Colorado Interstate Gas Company and Colorado-Wyoming Gas Company, respectively, has among other matters, prepared studies showing the original cost of the plant of each of such companies. The original cost studies so prepared conform generally to the principles set forth in the Commission's Uniform System of Accounts for natural gas companies.

"The approach followed in obtaining original cost has been essentially an accounting approach. That is, the dol-

lars accounted for as plant on the respondents' books have been reclassified or earmarked, as appropriate, or eliminated if the facts developed, as related to sound accounting, so warranted.

"An original cost study which disregards either wholly or in part the accounting results shown on the company's books is unacceptable. This is a fundamental maxim in the practical application of the original cost principle. In other words, original cost in order to be valid must be obtained by an accounting method. It must conform to certain coordinated and consistent principles which are inherent in accounting theory and methodology.

"During the past five or six years a significant change has taken place in public utility accounting in the United States through adoption of uniform systems of accounts which embody the original cost principles or doctrine with respect to plant assets. With reference to the electric and gas utilities, such uniform systems of accounts have been sponsored by both the Federal Power Commission and the National Association of Railroad and Utilities Commissioners. Many state commissions have adopted systems of accounts embodying the basic principle of original cost. In fact, it is now estimated that 90 per cent of the electric utility industry, measured either by assets or revenues, is using some system of accounts which embodies the original cost principle.

"The Uniform System of Accounts for natural gas companies prescribed by the Federal Power Commission became effective on January 1, 1940 and reports indicate that the Federal Power Commission system and the system with which it is nearly identical, namely, the one adopted by the National Association of Railroad and Utilities Commissioners, are also rapidly attaining wide acceptance on substantially a national basis.

"It is also significant that the system of accounts prescribed in 1935 for telephone companies by the Federal Communications Commission recognizes the original cost principle. In 1935 the Interstate Commerce Commission prescribed a system of accounts for pipe line companies which likewise recognizes the same principle although not

called by that name. In addition, the system of accounts for water companies recommended by the National Association of Railroad and Utilities Commissioners also requires that the plant accounts be reclassified and kept in accordance with the original cost basis.

"The original cost principle is highly acceptable from the standpoint of accounting theory. The doctrine in itself or its accounting application does not add to or subtract anything from the plant accounts of a utility company; it merely *analyses*, classifies, and segregates amounts which are significant to regulatory bodies, investors, and even to management. It permits achievement of one of the fundamental objectives of good financial reporting through adequate and truthful disclosure of highly pertinent data.

"To understand the historical reasons for the adoption of the original cost principle it is necessary to understand the condition of utility accounts in general at the time the systems of accounts were under compilation some six or seven years ago. Many public utility accounts were in very bad shape. The tremendous amount of inflation disclosed by the Federal Trade Commission in its investigation of public utility companies is a matter of public record and common information to the industry. Regulatory bodies recognized as a result of that study that some sort of action was necessary or at least desirable to correct the abuses which had been disclosed. I know personally of many cases in which the property accounts were almost meaningless because of large unidentified amounts resting in lump sum accounts. I know of cases in which the investment in the various utility departments, such as electric, gas, street railway, and so forth, was not known by the management and of course, under such circumstances, the cost of a particular generating station or transmission line was hopelessly concealed or buried. It was general knowledge among public utility accountants that retirements of property had been made by the utility companies without proper record, and that in many cases retirements were recorded at estimated original cost of construction although the amount carried on the books for that property might have been much greater.

"One of the principal abuses in earlier utility accounting was in connection with acquisition of going concerns, that is, mergers, consolidations, and other property acquisitions. It was probably for this reason that the systems of accounts which have been recently adopted apply the original cost doctrine technically to the acquisition of operating units or systems. The original cost system furnishes a remedy that goes to the source of the evil because it provides that the cost to the person first devoting operating units or utility systems to public service shall be recorded in the detailed plant accounts, and that any difference between such costs and the costs to the present owner shall be earmarked in specific accounts. In other words, the new systems, so far as the plant accounts are concerned, require first and fundamentally the reclassification or breaking up of the amounts appearing on the books.

"The original cost systems of accounts yield other benefits. Original cost is an element to be considered in the computation of the rate base, and the only manner in which original cost can properly be ascertained is by an accounting process. The condition of the records of many utility companies a few years ago did not permit this ascertainment within a reasonable time with a reasonable amount of effort and cost.

"Also of importance is that after the necessary information is available, through application of the original cost principle, proper regulatory steps can be taken to obtain sounder financial structures for a great many public utility companies. As soon as investors are assured of the absence, or at least the disclosure, of inflation in public utility capital accounts, money should be attracted to the industry more easily and at a lower rate. The original cost scheme is the only scheme in my opinion which can accomplish these objectives.

"The systems of accounts prescribed by the Federal Power Commission, as well as those promulgated by the National Association of Railroad and Utilities Commissioners, definitely prohibit the recomputation of the cost of the company's construction as of the effective date of the system of accounts, when such construction was accounted for

in accordance with the system of accounts in effect at the time or in accordance with the discretion of management as exercised under the broad principles of accounting.

"Gas Plant Instruction 2-B of the Federal Power Commission system of accounts for gas utilities contains the following definite language:

> "'* * * It is likewise not intended that adjustments shall be made to record in gas plant accounts amounts previously charged to operating expenses in accordance with the uniform system of accounts in effect at the time or in accordance with the discretion of management as exercised under such uniform system of accounts.'

"A similar provision is in the system of accounts for electric utilities and licensees.

"It has been the consistent interpretation of the Federal Power Commission's Bureau of Accounts, Finance and Rates, of which Mr. Chas. W. Smith is the head, that Instruction 2-B prohibits any restatement of plant costs if such costs were in accordance with generally accepted principles of accounting at the time when recorded.

"The National Association of Railroad and Utilities Commissioners has also been emphatic in its interpretation of Instruction 2-B. The following language is used at Pages 9 and 10 with reference thereto in a publication entitled 'Statement Relating to the Original Cost and Reclassification of Utility Plant Pursuant to the Provisions of Uniform Systems of Accounts for Electric, Gas and Water Utilities,' revision of September 20, 1940, prepared by the Committee on Statistics and Accounts of the National Association:

> "'Restatement of costs based upon revised allocations of joint expenses (expenses applicable to construction and operations) cannot be permitted. Two self-serving, self-impeachments must be guarded against; "our records are in such bad shape that we cannot determine the cost of our property from our books and records" and "we have not in the past properly distinguished between construction and operations and construction and maintenance."

"* * * The intent of the reclassification is to reclassify the dollars in the plant account as of the effective date of the system of accounts to the new accounts. This process is a reclassification and not a reaccounting. The utilities are required under the system of accounts to reclassify the dollars in their plant accounts as of the effective date thereof and not to compute a hypothetical original cost of property constructed by them."

"The uniform system of accounts promulgated by the Public Service Commission of New York for gas companies is even more rigid than the provisions referred to above of the Federal Power Commission and National Association systems. Gas plant instruction 2-F of the New York system provides as follows:

"'Nothing herein stated shall be taken as permitting the recording as part of the original cost of gas plant of amounts charged in previous years to operating expenses, operating taxes, or other income or surplus accounts.'

"From the foregoing language it is clear that the New York system specifically prohibits the restatement in plant accounts of any item heretofore charged to any part of the income account or to surplus, even if the charge was purely an accounting error.

"The position taken by the Federal Power Commission's accounting division and by the National Association of Railroad and Utilities Commissioners, indicated above, has positive sanction in accounting theory. They seek to prevent what would be the equivalent of writing up plant accounts and certainly the latter is one of the worst abuses in utility accounting.

"To understand completely why the interpretations of the Federal Power Commission's accounting division and the National Association represent sound accounting practice, it is necessary to understand some of the fundamentals pertaining to the basic nature of accounting.

"Accountancy as applied to a business entity, in brief, deals with proprietorship, or the assets represented by

proprietorship, and their changing amounts as measured in units of money. Of primary importance in the accounting process is the assigning or allocating of costs to or matching of costs with, revenues. This phase of accounting has been described as 'crucial' from the standpoint of periodic income measurement and admittedly it comprehends most of the difficult problems of accounting analysis. Accounting employs innumerable details in its processes and furnishes vital information to business management and proprietors but its central purpose is cost accounting, that is, determination of the cost of doing business—the cost of obtaining revenues and the resulting profit or loss, or income.

"Contrary to the belief of the uninformed layman, accountancy is not an exact science. Every qualified accountant appreciates how utterly true this statement is. Accounting principles and practices are based to a considerable extent on logic, but its philosophy is also influenced tremendously by convention and tradition.

"Although accountancy is far from being an exact science, it is nevertheless a well-developed science. Its mechanisms are unavoidably very complex for a large business organization. The mechanics of accounting as practiced are far from being uniform.

"As to its broad fundamental principles, however, the science of accounting is about the same everywhere, but even those broad fundamental principles are not inflexible in their detailed application. In fact, much choice and discretion are permitted management and accountants within the scope of those broad principles. To illustrate this point, it is fundamental in accounting that inventories of merchandise, supplies, and so forth, when existent, should be included in the balance sheet and proper effect given in the income statement. The method of pricing the inventories, however, is subject to wide variation and to much discretion or choice. Department stores, for example, use a statistical method in pricing their inventories; some businesses use a first-in, first-out method, whereas others use the last-in, first-out scheme. Some businesses state inventories on the basis of cost or market, whichever is lower,

while others use cost, and in some cases where inventory costs cannot be obtained, market value less estimated selling expense is used. The Federal income tax regulations for many years have permitted wide discretion in pricing inventories, but it is significant that no change in method of pricing may be made without obtaining special permission from the Commissioner of Internal Revenue.

"In the extractive industries it has long been accepted accounting practice to charge substantial replacements of plant to expense just the same as in many jurisdictions, and in England it is accepted law for the extractive industries to pay dividends out of capital. In fact, the extractive industries, because of the nature of their undertakings, quite generally charge items to expense which would ordinarily be charged to capital or plant accounts in other business enterprises. There is good reason for this, of course, from the standpoint of business policy, and the practice if followed consistently yields satisfactory and sound accounting results which are generally accepted.

"One of the characteristics of public utilities is their relatively large investment in plant assets. A tremendous amount of accounting, revolves around such assets. Considerable discretion has been allowed in the past and is still allowed the management of a particular utility company in accounting for its investment although obviously the natural tendency of regulation is to restrict the area of managerial choice.

"While considerable variation has existed in individual policies of accounting for plant items, accountants have been equally willing to certify to financial statements of companies which have followed different methods or policies. They have been right in doing so, because the general or accepted principles of accounting do not lay down one and only one inflexible rule. Any practice may be right if it is within the limitations of the broad scope of an accounting principle and is followed consistently.

"The reason for this condition is that accounting, to repeat and to re-emphasize, is not an exact science. With this, any qualified accountant will agree.

"As to many items which are charged to the accounts,

the question is not what treatment is absolutely right or wrong, but rather which is the preferable practice; and the treatment adopted for individual items is not nearly so important as consistency in the treatment of all such and similar items.

"This necessitates a few words relative to the importance of consistency in accounting. When a public accountant certifies to financial statements, he invariably makes a positive affirmative assertion that the statements have been prepared in conformity with genrally accepted accounting principles applied on a basis consistently followed. Any departure from consistency requires a qualification in the auditor's certificate. This reference to consistency is contained in the form of certificate approved by the American Institute of Accountants. It is in widespread use, as reference to the annual reports of almost any corporation having listed securities will disclose.

"Consistency is vital to the integrity of financial statements. It is absolutely essential that the accounts which underlie the balance sheet and income statements be kept at all times in accordance with consistently applied principles and practices, for otherwise distortion, manipulation and untruthfulness, consciously or unconsciously, would result.

"One of the more common misconceptions of accounting among the uninformed is that the two principal financial statements, the balance sheet and income statement, are not related. This misunderstanding where present is indeed unfortunate. These two statements are very closely related and this relationship is always present, consciously or unconsciously, in the minds of accountants. In fact, this is fundamental in the science of accounting.

"It is one of the first principles taught to students of accounting and represents something they are never allowed to forget either during instruction or in practice. A particular charge may be recorded in an account of either statement but not simultaneously, that is, duplicated, in the accounts of both.

"Charges are frequently made to balance sheet accounts and then subsequently prorated or allocated to income ac-

counts of different periods. This process is going on all the time as one of the essential routines of accounting. It is important that accountants, analysts, and others who use accounts do not forget the relationship of the two statements by focusing attention exclusively on one or the other even momentarily. Such a misconception may result in distortion and serious error.

"The relationship of the vital principle of consistency in accounting to any proposed reaccounting or restatement of items charged to expense in the past is very clear. It means, in my opinion, that costs which were recorded in the past in accordance with accepted principles of accounting at the time may not now be reaccounted for and the election at the earlier date annulled merely because of a change in view or purpose.

"The very nature of business transactions makes it mandatory that consistent accounting principles and practices be followed. As to many expenditures there is no sharp line of demarcation between operating costs and capital costs. It has constantly been recognized by accountants and acknowledged by the courts that it is often difficult to draw a precise line between expenditures for construction and those expenses which are incidental to operating or maintaining the plant. Hence a great deal of discretion, that is, managerial discretion, must be exercised in each determination of costs. Practical methods vary not only among industries but also within any particular industry. This in itself is not objectionable. The important thing is that some acceptable method be adopted and adhered to consistently, changes being made whenever advisable for the future and proper publicity given to any change of method.

"The problem of matching costs with revenues is not simple in practice. Many costs are joint costs in one way or another, that is to say, they consist of expenditures incurred which represent services applicable to two or more items or functions. Some of the costs of manufacturing industries are allocated to as many as hundreds of products. The cost of hauling different classes of freight is a problem of joint costs which still defies practical solution. The cost of distributing electricity is so difficult of deter-

mination that very few cost studies have ever been published in connection therewith. The reason is joint costs. The most common joint costs are overheads or indirect costs. Overhead or indirect costs are costs which are not incurred directly or solely for an individual item or function. Therefore, overheads must be allocated or prorated on some basis to the several items or functions to which they are related.

"There is not just one and only one acceptable method of allocating or prorating overhead costs. Many methods are in practical use. Great choice is allowed in the field of accounting and management. No system of accounts prescribed by any regulatory commission, to my knowledge, lays down the basis or method which must be followed in making distribution of overhead expenditures. It is important that the method of allocation be equitable and that reasonably accurate accounting results be obtained, but further than this the various uniform systems of accounts are silent.

"It is not necessary under accepted principles of accounting that overheads, such as general and administrative expenses, be classified as construction overheads at all. When an industrial or commercial concern constructs a new plant, it does not usually charge to the cost thereof any amount for regular officers' salaries, even though officers whose compensation is normally charged to the general and administrative expense accounts, spend considerable time in supervising the construction work. The classification of accounts prescribed by the Interstate Commerce Commission for steam railroads prohibits the allocation of general and administrative expenses to construction. General and administrative expenses go on generally in the same amount whether or not any construction is in progress, and there is good logic to support the principle that only such part thereof as is incurred specifically for construction purposes should be capitalized.

"For several years during the late 1920's and the earlier 1930's, while associated with public accounting practice, on numerous occasions I examined the records and the accounting practices of companies in the extractive industries, particularly coal mining companies and natural gas

companies. These engagements included comprehensive annual audits of the accounts of such companies, investigations in connection with acquisitions of such properties, and preparation of their Federal income tax returns. As previously stated, the extractive industries frequently charge many items to current expenses which other industries, particularly the utility industry, would likely charge to plant. Generally speaking, the extractive industries are and have been much more conservative in charging items to plant than other business enterprises. There is a decided tendency on their part, well supported by accounting principles and practices, to charge items to expense rather than to plant.

"One theory of accounting followed by a great many coal mining companies, representing the views of able management and accountants in that industry, involves charging directly to expense any addition of property or plant or other expenditure required to maintain the productive output of the mine. This often includes large units, such as locomotives, cars and long stretches of new track and large amounts of related development costs. This practice has been accepted by the Bureau of Internal Revenue for income tax purposes, if followed consistently, and was upheld in the courts.

"For many years it was practically the universal practice of natural gas companies, and I understand it is still the practice of some oil companies, to charge what are termed 'intangible drilling and development costs' to expense. These items are wages, fuel, repairs, hauling, supplies, and so forth, incident to and necessary for the drilling of wells, preparation of wells for production of oil and gas, and similar expenses for gathering lines. To a much less extent the cost of labor in laying transmission and distribution lines as distinguished from gathering lines was also charged to expense. I do not believe, however, that this latter practice was very widespread. In the past natural gas companies have been more reluctant than electric utilities to charge overhead costs to plant accounts.

"The so-called intangible drilling and development costs have been charged to expense under the principle that they represent cost of keeping up and maintaining the business

rather than the cost of improving it or adding thereto. The accounting practice is based upon the reasoning that the cost of drilling wells and laying gathering lines are for the purpose of maintaining a supply of gas and not adding to that supply. It has been pointed out, that the old wells were being exhausted and new wells had to be drilled in order to maintain the supply of gas for customers. The cost of materials such as pipe, casing, and so forth, could be salvaged later but the miscellaneous charges I have mentioned have no salvage value. Hence only the cost of material could be capitalized under the principle referred to above. The principle and practices applied represent sound, accepted accounting if adhered to consistently.

"In the early income tax laws, such as the Revenue Act of 1918, the problem of accounting for the so-called intangible costs arose. Article 223 of Regulations 45 relative to the 1918 Revenue Act specifically allowed natural gas companies the option of charging such items to expense or of capitalizing them. However, once the taxpayer had exercised his option, he was required from then on to follow that method consistently. It is a basic philosophy of the income tax law, that the taxpayer's accounting method should be followed for computing taxable income unless his method clearly does not result in the true income.

"Numerous authorities have sanctioned the charging of intangibles to operating expense. The Public Service Commission of West Virginia and the Public Service Commission of Indiana have allowed such items as expenses in rate proceedings. Under the present uniform system of accounts for oil companies issued by the American Petroleum Institute, it is permissible to charge the items in question to current expense by means of a reserve account. When the Public Utility Commission of Pennsylvania had under consideration in 1919 a system of accounts for natural gas companies, the accounting committee of the Natural Gas Association of America appealed to that commission to include drilling costs and the costs of laying gathering lines as current expenses.

"The foregoing indicated accounting practices of the extractive industries conform to sound accounting principles even though they differ (for good reason) from the practices followed by most other industries. These practices

are and have been very widespread and we may, therefore, characterize them as general practices in the extractive industries. They have long represented accepted principles of accounting and have been the basis of reports to investors, prospectuses, security listings and income tax returns. The only reason that some of the natural gas companies do not follow the same practices today, in my opinion, is that systems of accounts prescribed by regulatory commissions having jurisdiction require a different practice.

"The fact that the new systems of accounts do not permit continuation of some of the former practices is not any indication that they were wrong or unacceptable. Uniformity in regulation of utilities is generally considered desirable and with that in mind accounting methods deemed preferable have been written into the systems of accounts effective as of specified dates, but not made retroactive prior to such dates.

"In order to understand more clearly the significance of the foregoing discussion it is necessary to consider the relative importance of the income statement as compared with the balance sheet and particularly the plant account.

"The accounts which are reflected in the income statement, that is revenue and expense accounts, are the media through which costs are matched against revenues. Here is indeed the crux or the central problem of accounting, the pivot around which all accounting phenomena revolve. Professor Paton has recently expressed the same idea in slightly different language as follows: (See page 7 of 'Recent and Prospective Developments in Accounting Theory' by William A. Paton, published by Harvard University Graduate School of Business Administration, 1940).

> "'Costs' rather than 'assets' is the significant term in presentday accounting. Costs are incurred and are charged to cost accounts. From time to time the pool of costs is analyzed for the sake of determining the charges to be applied to current revenues on the one hand and prospective revenues on the other. After absorption of the expired costs the amount to be deferred emerges as an 'asset' balance."

"This means that the income statement is much more important in accounting than the balance sheet because the

latter is only incidental to the truly essential accounting processes which are related and expressed in the income statement. The balance sheet comes into existence mainly because of the necessity of periodic reckoning, that is matching of costs against the revenues of a particular period, and the attendant deferring and accruing of costs.

"This increasing recognition of the greater importance of the income statement has been inevitable as generally better understanding of accounting principles has gradually evolved. Qualified accountants have recognized the importance of income accounting for many years and it is believed that laymen now have attained a much better understanding of this real emphasis of accounting.

"Because of the fact that matching costs against revenues is the central focus of accounting it is more important that all expenses be included in the income statement than it is for every *conceivable* item to be charged to plant. A company which follows the practice of ascertaining all costs which under some theory may be called plant costs, while leaving out of consideration the setting of accounting transactions when they occurred and ignoring the expense side of the problem, does not follow good accounting. Its accounts are biased, not wholly truthful, and to say the least the company is guilty of false emphasis. It is more logical and much better accounting to follow the principle of making sure that all the expenses are accounted for as such and of considering the residual costs as plant rather than vice versa.

"Consistent adherence to a sound scheme of accounting can result in no duplication of costs. Once a cost is matched against revenue it disappears from the books, so to speak, because its expiration is recorded as an accomplished fact, that is as an expense. Under proper accounting this expense or expired cost cannot at some future date be reinstated as a legitimate cost and again matched against revenue as a legitimate expense. This likewise prohibits such a cost from being restated to the plant account because that treatment presumes that the cost would be subject to depreciation which would mean that the cost would ultimately be matched in segments against revenues of a succession of periods as a result of the annual depreciation charges. This too would be a clear duplication of costs.

"Departures from coordinated and consistently applied accounting concepts in making original cost studies often yield results which are inaccurate. An original cost inventory and valuation which ignores the fact that certain items were charged to expense on the company's books is not valid. One typical example will show how false a result can be obtained by improper methods. A pole which is rotten at the ground line is saved for the time being by the installation of a stub. The cost of the pole stub is a proper maintenance expense charge and is generally so considered by accountants.

"It would therefore not be a proper charge to plant. However, a valuation man in taking an inventory sees the pole stub and may assign a value thereto and include it in his original cost estimate. Obviously his method would result in duplication and falsification in the company's accounts. This is but one typical example of numerous similar possible misapplications of the original cost principle. Another way of illustrating this same possibility of error is to visualize what would happen if two men were sent out independently of each other, one to compute all the expenses which by any stretch of the imagination could be called expenses and the other to compute plant costs with instructions to include every conceivable item which could be termed plant cost. It is apparent that their results for the same company would show much overlapping and duplication. This would come about because each would place emphasis on only one side of the transaction. Each emphasis would be a false emphasis and it is probable that each result would be incorrect.

"May I repeat and re-emphasize at this point that an original cost study to be valid must conform to consistent accounting principles and if proper results are to be obtained the transactions entering into such a study must be viewed in the light of all their atmosphere and settings both individually and as an interrelated whole.

"Reproduction cost new studies which include a value for items which were charged to maintenance on the company's books also violate one of the principles of logic that dominate the science of accounting, that is, that the

same expenditure may not be considered both plant and maintenance. It may be either capital or expense but it cannot be switched from one to the other so as to best fit the particular occasion or purpose.

"Another particularly unsound practice which violates the accounting principle that costs which have been accounted for as expired may not now be reinstated as capital, is for a utility company to claim in computing its rate base observed depreciation which is less than the accrued depreciation computed on its books as a result of annual accruals to expense.

"So far as accounting is concerned this would have the same effect as adding to the plant account items which had been charged to expense during prior years. In either case it would constitute including in the rate base charges which had been made to expense in previous years, which had been already matched against revenue and had therefore expired in view of the company's accounting practices as exercised under the discretion of management."

(Vol. LVIII, pp. 8268-8294.)

* * * * *

Whereupon—

KENNETH L. SMITH recalled as a witness by and on behalf of the Federal Power Commission, having been previously duly sworn, was examined and testified further as follows:

Cross Examination.

By Mr. Dougherty:

Q. Mr. Smith, do you recall the volume that is recorded in the testimony which you gave with respect to certain accounting principles and practices?

Mr. Lange: Mr. Dougherty, that is in Volume 58, Pages 8268 to 8294.

By Mr. Dougherty:

Q. You are familiar and recall the statement which you read into that record?

A. Yes, sir.

Q. When did you prepare this statement under question, Mr. Smith?

A. I started the preparation of it, I believe either the latter part of November or the first part of December 1940 and worked on it from time to time. As I recall it, I completed it in January 1941.

Q. Have you prepared any similar statement or article that is similar to this?

A. No sir, I haven't.

Q. Did you ever write on this subject, the same subject which is discussed here for any accounting magazines?

A. You are referring to original cost principles, I take it?

Q. Yes, I think so.

A. No, sir.

Q. What authorities did you study in preparing yourself for the writing of this?

A. Well, as far as the general accounting theory is concerned, I think I can say I drew upon the studying I have been doing for a number of years. Now, as to specific research, in seeking to find out what is involved in the original cost principle, I have examined the Commission's Uniform System of Accounts for natural gas companies and also for electric companies; I referred to the publication of the National Association of Railroad and Utilities Commissioners which I believe is quoted on Page 5 of my written statement; I had occasion to refer to the system of accounts for natural gas corporations prescribed by the New York Public Service Commission; I studied very carefully an article written by Mr. Charles W. Smith on original cost which was published in the Accounting Review during 1937.

Mr. Lange: Mr. Charles W. Smith is the Chief, Bureau of Finance and Accounts, Federal Power Commission?

The Witness: Yes, sir, Bureau of Accounts, Finance and Rates.

I also had occasion to read some testimony which Mr. Charles W. Smith had given in the Northwestern Electric Company case, an original cost case. It so happened I had occasion to discuss this same problem personally with Mr. Smith in August 1940 when he was in Colorado Springs for one day.

I referred to the Uniform System of Accounts for oil companies sponsored by the American Petroleum Institute.

Mr. Dougherty: I didn't hear the last of that answer.

(The record referred to was read by the reporter as set forth above.)

The Witness: I drew upon my knowledge partly from memory of the system of accounts sponsored by the National Coal Association for coal companies and a book on the subject of coal mining accounting which was written by a man named Reed. I read those publications sometime in the 20's when I was doing considerable work on coal companies. In the latter 20's and the early 30's I had occasion to become very well versed with those two sources of material pertaining to coal companies.

I had recently examined a couple of publications on the subject of accounting theory one of which I believe I quoted in my statement. That was written by Professor William A. Payton and entitled "Recent and Prospective Developments in Accounting Theory," and the other one was written by Professor William A. Payton and Professor A. C. Littleton, entitled "An Introduction to Corporate Accounting Standards."

Those two publications do not relate specifically to the subject of original cost but they do form a part of the background and I quoted one of them at one place in my statement.

By Mr. Dougherty:

Q. With respect to the question of original cost, you have just said the articles you last mentioned did not deal with that principle. What about the recommended Code of Accounts of the National Coal Association? Did that deal in any way with the principles of original cost as you have discussed it in your statement?

A. Not directly. The reference I made to the system of accounting sponsored by the National Coal Association was merely to indicate an authority which would back up or support some of the information which I gave concerning the theory of coal mining accounting as I found it.

Q. That is the portion you refer to under the reference to extractive industries and coal companies?

A. Yes, sir.

Q. But the code as recommended by the National Coal Association does not contain within it this principle of original cost as is contained in the Natural Gas Code proposed or adopted by the Federal Power Commission?

A. No, I merely make reference to that system as a support to my contention as to what the practices were in the extractive industries at that time.

Q. Now, with respect to the code recommended by the American Petroleum Institute, what, if anything, does that deal with—the subject of original cost as you have discussed it in your statement?

A. It doesn't deal with it directly but it merely reflects the accounting of an extractive industry.

Q. There again the principles of original costs as defined in the utility code adopted by the Federal Power Commission are not embodied in that recommended code for petroleum companies?

A. Not directly certainly not as such.

Q. Well, there is no requirement in there or no recommendation that the petroleum company shall set up on its books as cost the cost to a predecessor company from which it purchased assets rather than the cost to the accounting company?

A. Of course, I don't believe your statement quite draws the distinction. What I really mean is that it doesn't require it to earmark the excess that it paid.

Q. Doesn't it provide for the setting up of capital assets purchased by a petroleum company at the price paid by the accounting company?

A. Yes, I believe essentially that is true.

Q. It is also true, Mr. Smith, that in these business enterprises that are not regulated such as the utility companies, there isn't any practice of making that distinction between the cost of property purchased by the accounting company and the cost to the selling company?

A. Not ordinarily unless that intangible, if it is an intangible, happened to be reflected in a good-will account or something of that nature.

Q. If a petroleum company, for example, bought a group of leases and wells and paid a million dollars for them in

cash, that would be the cost which would be set up on the books of that petroleum company and not whatever the amount happened to be, the cost to the selling company?

A. That is true. If I may qualify it I would state that under some circumstances even a part of this million dollars might necessarily have to be accounted for as an intangible and there you would have a comparable situation to either Account 100.5, Plant Acquisition Adjustments Account, or Account 107, Plant Adjustments Account.

Q. Where the money, however, was paid for physical property and there was no such thing as good will and trademarks or what-not involved, isn't the statement I made correct?

A. Yes, I believe it is if it is purely for physical property.

Q. So the authorities which you have mentioned in your statement that deal with this question of original cost as discussed by you are in effect the Federal Power Commission, the National Association of Railroad and Public Utilities Commissioners and the Chief of the Bureau of Accounts, Finance and Rates of the Federal Power Commission, Mr. Charles W. Smith, isn't that right?

A. I made some reference there to the Public Service Commission of the State of New York.

Q. So that in every instance the authority with respect to the question of original cost is either some State or Federal regulatory body or some official connected with such a regulatory body or the association which is composed solely of members of these regulatory bodies?

A. Yes, as far as I know, I don't know of any other authority that has written upon the subject of original cost.

Q. That was the question I wanted to ask you, with respect to accounting authorities not connected with those regulatory bodies. Have there been any documents or articles written, or books written on this question of original cost and accounting as provided for by the Federal Power Commission Code and as discussed in your statement?

A. I don't know of a single book that has been written. There have been a few sporadic comments at one time or other in a few of the journals, I believe; however, I don't know of any other article that was ever written by an accountant whom we might say had approached it from an

academic standpoint and had made it a sound unbiased treatise. I don't recall of any such article that has been written, or if it has been written it has never come to my attention, and I have made it a point to try to find out whether or not there have been such articles written.

Just in order to test this paper which I wrote here, this testimony, I sent a copy of it to Professor H. T. Scovill, head of the accounting department of the University of Illinois, where he has been for a number of years, asking him for his very frank reactions to it so as to get his impression. He was fairly complimentary on the article and said that he thought I had given a very good analysis of the original cost idea and he particularly commended that feature of it which denounced the claiming of something in the capital account, plant account, which had also once been claimed in the income account, especially for the purpose of setting rates.

Q. Does he teach public utility accounting at the University of Illinois?

A. There is no special course in public utility accounting—He was at one time consulting accountant for the Illinois Bell Telephone Company for a number of years and I understand he has handled cases before the Illinois Commerce Commission. I said there was no special course in public utility accounting and I want to modify that.

There is one graduate course that deals with all systems of accounting, including utility accounting and he does teach that course.

Q. The doctrine of method of original cost accounting as described by you has been the subject of considerable controversy between the Public Utilities who are subject to regulation by these regulatory bodies and the accounting staff of the regulatory bodies, has it not?

A. Yes, I believe that in general the public utilities have resisted the original cost idea.

Q. Isn't it a fact that a number of articles have been written by accounting officials of those companies which have expressed their disagreement with it and their reasons for that?

A. I am not familiar with any specific article now except in following the Public Utilities Fortnightly for some years I believe I can recall having seen one or two articles and possibly more in that journal written by—I am not sure whether they were accounting officers or not, but I recall having seen expressed disagreements with the original cost principle.

Q. Have you ever read any of the articles or addresses, public addresses, delivered at various meetings of the accounting groups of either the electric or gas industries in which this question has been discussed, and particularly the question of what you call reaccounting as distinguished from reclassification?

A. I don't recall any specific article upon that.

Q. Have you attempted to keep up with all of the literature on the other side of the question, as well as that on the side with which you are in agreement?

A. I can't recall of ever having refused to read an article that I found on the subject.

Q. That isn't what I asked you. I asked you if you tried to make an attempt to keep in touch with them and find out what was going on and read them so you would know fully everything that has been said on the other side as well as what has been said on your side of it.

A. Well, I believe I have, but—that is, I have tried to fully inform myself on the subject matter.

Q. You were aware that there has been a great deal of discussion on this question since the Federal Power Commission first started to put the principle into effect in its Code of Accounts for electric utilities?

A. Yes, it has been attacked in a great many places.

Q. Have you ever read articles by Professor Madden—I think he is Dean of the College of Commerce of New York University—on the subject?

A. I don't recall having read his articles.

Q. Do you know whether or not he has taken the position opposite to that expressed by you and which you say has been approved by a professor at the University of Illinois?

A. No sir, I don't know that.

Q. The idea of this original cost accounting was accepted by you first at what time, that is, when did you first become acquainted with it?

A. I first became acquainted with it in the latter part of 1936.

Q. That is when you first went to work for the Federal Power Commission?

A. Just about that time, yes, sir.

Q. That is and has been the source of this question of original cost accounting, hasn't it, the Federal Power Commission?

A. You mean they have originated the idea?

Q. Yes.

A. This same principle is in the Federal Communications Commission's system of 1935, I believe.

Q. Well, when was the electric code adopted by the Federal Power Commission?

A. It became effective January 1, 1937.

Q. The Power Commission, however, had been urging the adoption of this principle upon the National Association of Railroad Utility Commissioners long before that, hadn't it?

A. I am not so sure that is exactly the fact. In my discussions of the history of original cost with Mr. Charles W. Smith I have always gained the impression it was a joint product of the accountants for the Federal Power Commission and the National Association of Railroad and Utilities Commissioners; that is, the conditions that were disclosed by the Federal Trade Commission's reports were so far from meeting, the ideals of regulation and good utility accounting and the condition of the books of so many utilities was so chaotic that those people interested in regulation apparently seemed to be of about the same mind and at about the same time, as soon as the fact became disclosed through the Federal Trade Commission's reports, that something had to be done.

Q. The source of it was in regulatory groups rather than in some independent body of accountants or accountancy or experts in accountancy who might be teaching in the Universities?

A. I believe that might be true. It is just a case that necessity is the mother of invention.

Q. Your statement of the chaotic conditions of the books, is that based upon your examination of these books of the utility companies you speak of, or is it based entirely on the reports of the Federal Trade Commission?

A. Not entirely upon the reports of the Federal Trade Commission. When I was with the Federal Power Commission in the Washington office for a period of nearly two years I was in the Division of Finance and one of my principal duties at that time was to study the accounting and financial aspects of applications by electric utility companies for merger, consolidation, sale of property, and issuance of securities; and incidental to those applications the applicant company was invariably required to furnish the amount of writeup or whatever we could choose to call it in their plant accounts. If they didn't know what it was they were required to estimate it, and from having reviewed the accounting and financial aspects of possibly 30 or 40 applications of different companies I found that practically every one of them came in admitting those things, so I believe that is good enough experience to draw a generalization.

The Trial Examiner: We will stand in recess until 2:00 o'clock.

(Whereupon, at 12:30 o'clock, p. m., a recess was taken until 2:00 o'clock, p. m., of the same day.)

Afternoon Session, 2 P. M.

The Trial Examiner: The hearing will be in order.

Whereupon—

KENNETH L. SMITH, the witness on the stand at the time of recess, having been previously duly sworn, resumed the stand and testified further as follows:

Cross Examination (Continued.)

By Mr. Dougherty:

Q. Mr. Smith, I believe Mr. Charles W. Smith who is head of the Bureau of Accounts, has given similar testimony to this statement of yours in other proceedings before the Federal Power Commission.

A. I know of one in which he gave testimony that was very similar.

Q. And that is the testimony you studied and considered in preparing this?

A. I read that testimony.

Q. Well, as a matter of fact, some of the latter part of your statement is pretty much copied from that, isn't it?

A. No, I don't believe it is copied from it.

Q. Isn't it exactly the same as some of Mr. Charles W. Smith's testimony in the Northwestern Electric case which was an accounting reclassification case?

A. I think the meaning and import of it is very similar, yes, but as far as being copied, it wasn't copied.

Q. Well, if it turned out to be identical with a great deal of the language used by him, that would be a coincidence rather than just copying it out?

A. I'm afraid it would be. My association with Mr. Smith has been pretty close for a number of years and I have discussed these things with him many many times. I was reading over his article published in the Accounting Review on the subject of original cost and reviewed in 1937 it again after completing this article—this testimony. I found a great similarity of wording between those two articles.

Q. He has been very active in establishing this original cost theory through the National Association of Railroad and Utilities Commissioners?

A. My understanding is that he has worked very closely, in very close harmony with the association's committee on accounts and statistics.

Q. As a matter of fact, wasn't he quite a dominating influence in the deliberations of that body of the things they finally decided to adopt in the form of codes of accounts to be recommended to the various state committees?

A. I have never known him to admit that he was the dominating influence.

Q. I just asked if that wasn't so as you knew it.

A. I don't have any first-hand knowledge on which to base a conclusion like that. I know that he did work with the committee and whether he dominated the committee or not, I don't know.

Q. The electric code and also the national gas code were originally prepared under his supervision, were they not, and then submitted to the National Association of Utilities Commissioners for consideration by that body?

A. My understanding of the history of the electric code was that Mr. Charles W. Smith was appointed as a consulting accountant by the Federal Power Commission in 1935 and that his instructions were to work with and to cooperate with the Committee on Accounts and Statistics of the National Association in preparing a new code of accounts.

My understanding is that it was a joint product and it was so intended at the time of its inception.

Q. When you mentioned the fact that this original cost document has been accepted by a great many of the electric utilities and also that the natural gas code is rapidly attaining wide acceptance, do you mean that the various gas utilities are voluntarily accepting those principles or do you mean that it is being accepted by the regulatory authorities?

A. Well, I think what I really meant was that it had been adopted by the regulatory bodies and prescribed.

Whether or not the utilities are accepting it voluntarily or involuntarily, I don't know, as I haven't made that study.

Q. Of course, having the authority prescribed in the code of accounts, after it is once prescribed the utility has no alternative. You understand that, do you not?

A. Well, I suppose they always have what legal rights they have. I don't know.

Q. You mentioned that original cost in order to be valid had to be obtained by an accounting method. Now, is it your intention by that sentence to mean that in no other way can you attain what the actual cost of a piece of property is except by going to the books and finding out how the capital cost of that is recorded?

A. I think that is essentially true. Let me put it this way: The results shown on the books cannot be ignored. They have to be the central theme around which the amount of dollars set up for original cost must be determined. Sometimes a breakdown as between classifications or accounts necessarily has to be done by some other method than accounting.

Q. Then it is your understanding that original cost is purely an accounting viewpoint or an accounting term that

has no reference to anything except matters of keeping of accounts?

A. That is my interpretation, my opinion as to the original cost idea of principle as set forth in the Federal Power Commission's Uniform Systems of Accounts. In order to be a valid study it must be approached from an accounting point of view and must not ignore the results shown on the books.

Q. Well, is it your understanding that original cost has no other significance except as related to the books?

A. Under this system of accounts I believe that it must be related to the results shown on the books.

Q. With respect to a good deal of the general language that you use in here about the conditions of accounts of various utilities, was it your intention to apply that general language to either the Canadian River Gas Company or the Colorado Interstate Gas Company, particularly on Page 3 of your statement? Refer to that.

A. When I wrote that paragraph I wasn't thinking specifically of those two companies at the moment; however, it does seem to me that when the original cost principle is applied to those companies that possibly some of these things are applicable.

Q. Were the books of the companies in such hopeless condition that your Examiners were unable to ascertain the adjusted original cost satisfactorily?

A. No, I believe that as far as Colorado Interstate Gas Company is concerned, Mr. Schutte was able to spell out the original cost in a very satisfactory manner—that has been my understanding—and as far as Mr. Luttring's study was concerned of the predecessor of the Canadian River Gas Company, I believe that his testimony shows in one minor instance only was it necessary for him to resort to estimates; that is, he was able to get the information to build up his original cost from the books of the predecessors and of course from the Canadian River Gas Company books in so far as its construction was concerned.

Q. In a case where a company's books did not show the actual cost of the property, was it a practice to resort to estimates?

A. I think the estimates are confined largely to where records can not be located for predecessor companies and

that sort of thing. If there is a set of books, presumably that set of books will show what the company accounted for as its plant, and assuming that it didn't charge items to plant that were erroneous, the balance in the plant account, if it were the company which first devoted the property to public service, would probably show the original cost as contemplated.

Q. Where you have accounts in such shape that you have unidentified amounts and can't determine them very well, how are you by your reclassification process going to set up any better set of books than they have in the first instance?

A. Well, I think that applies to the statement I made just a minute ago, that when the total original cost is determined, it is also necessary coincidentally to break it down between classifications under the original cost provision of the Uniform System of Accounts and it is at that point that the total amount of dollars representing original cost can be broken down by estimates if there is no other means available.

Q. When you get through in such a case, don't you have just as unsatisfactory a record of what actually took place as you thought the original record was?

A. No, I don't believe you do. If your total dollars are correct and if you have established a breakdown which can be used for retirement accounting with reasonable accuracy, I think you have made quite a gain.

Q. In the character of books you are speaking of that are very unsatisfactory and have not been kept with the detail that is necessary, you would have just as much difficulty with your retirements, wouldn't you?

A. Yes, that is one of the objections to that kind of accounting, because retirements were often times not made on the excuse that there wasn't any information available with which to make the retirement.

Q. What do you mean exactly by an accounting method in determining original cost?

A. Well, the primary consideration is that the dollars accounted for as plant on the books of the company first devoting the property in the public service be given the primary consideration in setting up the original cost. In other words, that is a fact and circumstance that cannot be ignored.

Q. Is there no other way you can go out and determine the actual cost of a piece of property except by looking at the capital accounts on the books, plant accounts?

A. I might say that an inventory method might be used if it were subject to certain limitations and those limitations tie right back into the accounting; that is, if an inventory was taken, it would be necessary to divide the items in your inventory into at least two groups, those items which were capitalized on the books and those items which were expensed on the books.

Then in order to price that inventory, it seems to me that it would be necessary to go back to the records to find out the cost of the individual units and of course those units which had once been expensed could not be reinstated into the capital account under the original cost concept unless there was conclusive evidence that the expensing was purely an accounting error.

Q. You could, however, determine the actual cost of that inventory by going to the invoices and job tickets and finding out the exact expenditure of money that was involved in placing that property into plant?

A. If it were done with due discrimination, as I have stated before, and if the person who priced the inventory understood accounting methods, and knew how to interpret accounts and would rely basically upon accounting data as reflected upon the books, he might come to a satisfactory result by pricing out the inventory within those limitations.

Q. You are cognizant of the different definitions of book costs in the Federal Power Commission Code of Accounts for natural gas companies and the definition of cost, book costs being Definition 6 and cost being Definition 10?

A. Yes, I am familiar with those definitions.

Q. Now, I think that it is your position in your statement that having once accounted for the cost of a piece of property through the expense accounts that it should always be left there and that there could be no change by putting the actual cost of that property into plant account at a later time.

A. Assuming that the original accounting was not purely an accounting error. If there was any discretion exercised either by management in the interpretation of a system of accounts or in its broad power of discretion as management, then it is my position that any amount which was charged to expense must remain as expense. In other words, it cannot be restated at some subsequent time in order to serve a change in purpose.

Q. Well, that would result, would it not, in some instances in what you have as book costs not being the exact number of dollars as costs as defined in Definition 10 under the FPC Code.

A. Well, of course, 10 is a very broad concept that relates both to capital expenditures and to expenses and it is an accounting concept. The accounting concept of cost relates both to what we term capital expenditures and revenue expenditures or expenses. Any outlay of money is made with the idea that—with the purpose in mind eventually that outlay of money or cost will eventually be matched against revenue at some day or another, whether it is today or whether it is done in segments over a period of fifty years, for example.

The primary purpose and the fundamental accounting principle is just the same, so cost as used in Definition 10 is a very broad concept.

Q. Well, as it says, it is the money actually paid for property.

A. Or services.

Q. Now we are talking about plant, so whatever property is bought, the money actually paid for that and the services or labor involved in installing it would be what the cost was, wouldn't it?

A. Well, if the company didn't account for it as plant, though—

Q. Well, now, doesn't the cost occur before the accounting occurs?

A. You mean in this sense—as the expenditure is incurred we might say that all costs might be thought of as one common pool of costs and then your next step in the accounting process is determining when you are going to match that cost against revenue.

Q. Well, the accounting is recording what the cost is, isn't it?

A. Yes. I suppose what you have in mind is that the transaction might be consummated, the purchase and sale, before it ever gets on the books.

Q. Isn't that what your books are for, to record the transactions that have taken place?

A. I think that is a fair statement.

Q. So that you could in case of following out the concept of original cost as you have it, might have a book cost which is different than the actual cost of the property or services; that is, the book cost in the capital account?

A. It is very obvious that the total cost of a company over any period of time is going to be greater than the portion of that cost which it classifies in plant.

Q. Yes.

A. Because it is such a broad comprehensive term.

Q. Now you mention the discretion exercised by accounting officers in charging certain items of cost to expense and I assume that when you use that word "discretion," you mean that there are situations where either the charge might be made to capital or might be made to expense and that having exercised that discretion, then the decision is made and the charge is accordingly put on the books?

A. Yes. I think I can explain that in this way, that a company which is free to set up its own accounting system in accordance with the policies that it thinks are desirable, may adopt a policy and as a result of that policy it might be charging certain border-line items to expense while another company just like it that may be just across the street from it might adopt a policy a little different and I would hope that each of those companies would adhere to its policy consistently.

The similar company across the street might decide that those border-line things were capital and might choose to capitalize them instead of expensing them.

Q. Now, under the rules established by the Power Commission on making these reclassifications and under your concept of your original cost, neither company could make

changes in its plant account when it would come under the provisions of such a code as the Federal Power Commission code, and that would result, would it not, in two companies assuming that they had identical property, having different original costs shown on their books?

A. I believe that that is correct. You are assuming similar conditions all the way through.

Q. Yes. It is not—isn't that the logical consequence of the rule that you say is the underlying basis of original cost, namely, making no changes in your capital accounts at a later date because of some new code being adopted, isn't it the natural result that two companies with identical items of property who followed different concepts of putting property into capital or charging it to expense would have different original costs on their books?

A. I think that is true, assuming of course there are no compensating factors of any kind.

Q. If the charge has erroneously been made in the first instance, you recognize that the change should be made?

A. If it were an accounting error, I believe that our Code of Accounts is sufficiently broad to permit the correction of an accounting error. Of course some codes will not even permit that.

Q. Now, for example, you take the matter that you have referred to later in your statement of the practice of natural gas companies formerly, in years gone by, charging to expense all of the labor and intangible costs. I believe Canadian River capitalized all those intangible costs?

A. That is my understanding.

Q. And that was accepted as being an appropriate charge to capital account?

A. Yes.

Q. Now, if instead of doing that, Canadian River Gas Company had followed the practice as some companies have done of charging to expense all of those intangible drilling costs, labor and amounts paid to contractors, I assume it would be your interpretation now that they could not include those costs in the determination of the original cost of their wells?

A. Yes, that is my opinion as the proper interpretation of this Code of Accounts.

Q. Yet in both instances the same amount of money

would have been paid out for the well—the actual cost of the well would have been the same, wouldn't it, irrespective of how the books are kept?

A. They apparently wouldn't have so regarded it—

Q. They would have paid the contractor the same in either event?

A. Without reference to what they thought they were paying it for. You see they must have had a different frame of mind—

Q. I am talking about the dollars. They would pay the same dollars.

A. If you limit it to that statement, they would have paid the same dollars.

Q. And that is what the code says cost is, the money actually paid for property or services, so the same amount would have been actually paid for property or services irrespective of how they kept their books.

A. Yes, but I think it is significant to leave in the words "or services."

Q. Yes, because services are intangible.

A. They would apparently have regarded them as expenses or they wouldn't have expensed them at the time.

Q. Now, if they had not regarded them as expenses but had regarded them as services in connection with the installation of wells, I again say you would not suggest that that method of treating those costs be changed now?

A. Well, of course, that is just what they did. They did capitalize them and we have, I believe—and they did consistently—and we have recognized that as having been acceptable accounting under the practices of the industry at the time the accounting was done.

Q. Now, are these principles that you have discussed in your statement and about which you mentioned—is it your thought and your judgment that those principles are to be applied to determine the actual legitimate cost of the property which the Commission is directed to determine by the Natural Gas Act which in turn would be used as a rate base, say for determining rates?

A. I don't think I can answer that question. I don't believe I can say exactly what was contemplated in the Natural Gas Act by the term as to legitimate cost and I certainly don't know what the Commission will consider when it sets the rate base.

Q. I want to know what your judgment and opinion is when you make in this statement as you do on Page 4, that original cost is an element to be considered in the computation of the rate base, and the only manner in which original cost can properly be ascertained is by an accounting process.

Now, is it your opinion that the original cost as determined by your accounting process by the limitations which you have indicated is to be taken as the actual cost of property for consideration in determining the rate base?

A. Well, I believe that would be the actual original cost and as to any other factors that the Commission would consider in setting the rate base, I am not informed.

Q. Well, if it should consider that—if it wanted to consider the actual cost of the property, is it your opinion the only place that can be found is as reflected in the plant accounts of the company which cannot be changed or reclassified except with the limitations as you have stated?

A. Let's see. I'm not quite sure that I understand that question.

Q. You have stated that original cost could only be obtained by an accounting process, and that means in so doing that you can't make any recomputation of cost of construction now, which would result in changing or capitalizing items that were expensed formerly. Now, is it your intention in making this dissertation in the record that in your opinion the original cost so determined is the cost that is to be considered by the Commission in determining the rate base?

A. Well, it is the original cost which I would recommend without qualification that the Commission consider in determining the rate base.

Q. And going back to the incident of intangible costs on well drilling, then that cost which the Commission would consider would depend entirely on how the books had been kept?

A. Assuming a consistent method all the way through in accounting for plant, in accounting for depletion, with consistency throughout the whole scheme of accounting, that is right.

Q. So you would have in one instance cost that might

be greater by a sizeable amount of dollars than in the other instance and wouldn't then that logically result in higher or lower rates for gas, depending upon the opinion of your bookkeeper back some number of years ago?

A. I would not know about the rates because the weighing of this evidence and the setting of the rates is something that goes beyond the accounting.

Q. Well, there is no other cost that you think the Commission should consider except that which is shown on the books in the capital account?

A. No other original cost. I think there is where a misconception of the original cost scheme comes in. We put certain items in Account 107 and Account 100.5 which is the plant acquisition adjustments account. Now, those items are earmarked. They aren't disposed of at all in setting up an original cost. The disposition of those items depends upon the Commission and the right to dispose of those items is specifically reserved in the system of accounts.

To me the system of accounts says very specifically that "we don't want you accountants to go any further than to earmark these items," so we aren't taking dollars that were accounted for as plant and just wiping them off the books or completely off the record. They are still there. They are earmarked and whatever weight might be given those is something that I am not concerned with as an accountant at all.

Q. We weren't talking about that particular part of your original cost process, but the part of it that has to do with accepting finally at original cost the amounts that were charged to plant account and prohibiting any recomputation of costs of the property that is in existence for the purpose of finding what its actual cost was, now, there, do you not get into a situation where the rate base would be affected by the principles of bookkeeping established by the accounting officers of your company?

A. I would only go so far as to say that the original cost might be affected. As to the effect on the rate base, I wouldn't know.

Q. Then you don't intend this discussion you have had here to be accepted by the Commission as recommending that in determining the rate base that they should give

consideration to the original cost as booked rather than to a determination of the actual cost of that property from the more original records of the company such as vouchers and time tickets and so forth?

A. Well, my sole purpose as I see it is to set forth the rules that apparently should apply in finding original cost contemplated in the system of accounts and to show that the original cost principle as embodied in this system of accounts is consistent with good accounting practice and with good accounting principles but as to the weight to be given to the original cost so determined, I believe that is entirely up to the Commission.

Q. Now, these accounting principles you speak of, are they the same as would apply to industrial customers or any other type of concern that was not a regulated utility?

A. I believe that any reaccounting for items which had been charged to expense in accordance with the discretion of the management would be governed by exactly the same principle of accounting whether it was a public utility and a regulated company or a non-regulated industrial.

Q. Now, is it your position that the income accounts should be maintained with the same consistency as your plant accounts through past years?

A. If the plant accounts are maintained on a consistent basis, it naturally follows that the income accounts would be maintained on a consistent basis for the same period. The two things are so inter-related that the results in one are by virtue of the accounting method itself correlated with the results shown in the other.

Q. Now, when you have made the changes you have in these two companies' depreciation reserves, doesn't it naturally follow from that that you have changed their income accounts in past years contrary to the principles that you have expressed with respect to consistency in not making past changes?

A. No.

Q. Wherein is the difference in what you do and what the company wants to do?

A. The company when it set up its plant accounts expensed certain items which it now seeks to capitalize I presume that Mr. Schutte's testimony shows to what extent, if any, the company might have elected to have capitalized

those items, had it so exercised its discretion originally. In any event, so far as I know the company made no error when it charged them off as expense as they occurred.

Now, when you speak of a change in depreciation you come to a somewhat different phenomena. The two things aren't comparable. The companies' depreciation as viewed by the accounting staff based upon the information furnished by the Commission engineers was regarded as having been an accounting error. It had created a situation in the companies' balance sheet which I have never seen condoned by any accounting authority; that is, the creation of a secret reserve through the overstatement of a valuation reserve. As I said, I have never known of any accounting authority who ever condoned any understatement of net assets or putting it in the converse language, the overstatement of a valuation reserve, and I recall very specifically that every accounting authority that I know of who has touched upon the subject of secret reserves has always denounced it and condemned it.

Q. Well, now, that change in reserves or in the depreciation was made by you as I understand it, upon the basis of information obtained within the last year or so, and as I recall your testimony about it, the change was made on the theory that upon the basis of the information now available the amounts accrued by the company each year were too high, is that correct?

A. That is correct.

Q. Now with respect to the establishment of this code of accounts and the principles that it lays down for capital items, in some instances it is considerably more refined, isn't it, with what shall be charged to the capital items than the practices followed by the company in the past?

A. Not having made the examination of the plant account myself, I will only be able to speak as to my understanding of it and make a general statement.

The prescribing of a code of accounts almost universally does narrow the field of discretion or choice, so I think perhaps your statement is accurate, that there is greater refinement in this code.

Q. Now the following of these new principles which re-

sult in a greater refinement will result, will it not, in more items being capitalized than were in the past?

A. I am not certain as to that. You mean in relation to the Colorado Interstate Gas Company and the Canadian River Gas Company specifically?

Q. That is right.

A. I am not sure as to that.

Q. The necessity of following these rules, however, in the future will cause a difference in the relative condition of the capital accounts prior to the adoption of the code and afterwards to the extent those differences do exist, will it not?

A. What you mean there is going to be in effect a necessary change in accounting polices?

Q. That is right.

A. Probably that is inevitable in this case.

Q. So that when we do get along a few more years we will not have had that consistency in our accounts you speak of; that is, according to your idea we will be consistent up to a certain date and then consistent on a different set of principles from then on?

A. Yes, I think I have covered that in my written statement.

Q. Then the situation with the depreciation means that any changes you make now in the discretion of the company were appropriately made some several years ago?

A. That is the thing I am not sure of, as to whether it was appropriately made. I don't know to what extent the company was influenced by tax considerations and I don't know how good their information was.

Q. Wouldn't that be the same with respect to other items that were expensed instead of capitalized where you accepted the discretion as exercised?

A. Well, no, because on those items—we will assume for the purpose of illustration that many of them, or at least a part of them, maybe all of them, I am not certain as to the facts on that, might have either been expensed or capitalized—they exercised their discretion. They had a definite purpose in mind and the history of the company shows that their revenues covered those expenditures as expenses very amply and they might have even had tax considerations in mind then. I don't know what they did

have in mind. I assume Mr. Schutte's testimony will show whether or not there is any ground for the company claiming they might have capitalized them at all. There is still a question about that.

Q. Well, with respect to depreciation, the company did adopt in the early years a uniform amount, did it not; that is, from 1931 on, and consistently applied that—if not an attempt, a method of determining the amount which was uniform?

A. As I recall it had some changes again in 1937 and 1938 on Colorado Interstate but I don't believe those changes were of major importance.

Q. Those charges are always a matter of the exercise of some judgment, are they not?

A. I think that after you have the data available with which to make the computation that the exercising of judgment must be kept within pretty definite limits or you reach the point of distortion through the guise of it being an exercise of judgment.

Q. Well, those who have determined the depreciation rates for the Federal Power Commission have had to exercise judgment, have they not?

A. Yes, to the extent that judgment is necessary in arriving at an estimate. Technical judgment in that sense is a matter of determination.

Q. So as I say, the question of depreciation is one that is based upon the exercise of judgment?

A. With certain limitations, that is probably true.

Q. Having once exercised that judgment and exercised the discretion of management in charging against income a certain amount of depreciation, aren't you violating the rule you applied to the companies when you now restate that depreciation?

A. No, I believe there is enough of the element of error involved to more than offset the element of judgment there.

Q. Doesn't the rule work both ways, Mr. Smith, that whenever your boys want to make some changes that is an error of judgment and whenever we do we exercise our discretion?

A. Well, I don't belive that I can agree with that. In restating depreciation it would seem to me that we were

making an adjustment there which really operated to the advantage of the company rather than against the advantage of the company.

Q. Now when you state that a certain amount of discretion is permitted and that also the accounting isn't a matter that is agreed upon by everybody, do you mean by that that there are differences of opinion that can honestly be held by different accountants depending upon the view they take of these various matters that you have discussed?

I think you used the term "it is not an exact science."

A. That is correct, it isn't an exact science. There have for a good many years I believe been differences of opinion among the accountants. It has been my observation over recent years that those differences of opinion are coming to be narrowed down. The academic approach toward accounting has been based upon logical principles. It is a consistent science which does have a logical basis and has merit for a good many uses, but was largely unexplored until the last ten or fifteen years. As those principles in accounting have been uncovered and spelled out and treated scientifically it has narrowed down greatly—it has served to narrow down greatly the differences of opinion among well-informed accountants who are unbiased.

Q. These two particular principles which are the essence of your original cost scheme, you don't give much *leaway* for difference of opinion on those, do you?

A. What are you referring to specifically?

Q. The restatement of cost when first devoted to public service, although not first cost to the accounting company, as against stated cost in your capital accounts where you had not actually accounted for the actual cost of the property when first installed. In those you laid down a pretty hard and fast rule.

A. I think the code of accounts itself deals with the question of setting out the cost to the person first devoting it to public service. To me that is merely a classification or earmarking certain dollars in a certain way. There is no inconsistency of that principle with any accounting phenomena I know of. I think that where criticisms of the original cost principle have been made they have been made with a misunderstanding of the accounting significance of that process. I maintain that merely earmarking dollars

is as far as the accounting goes. The result of that earmarking is a regulatory process over which the accountant has no control and no responsibility. He merely sets out the dollar amounts that are useful—I believe I stated to the regulatory body, investors, and even to the management under certain conditions.

Q. Now with respect to this other theory that you can't restate the cost of the property that had formerly been expensed, you recognize no deviation from that, I take it?

A. Only where the expensing was purely an accounting error. I have tried to develop in this testimony my reasons for believing that rule was entirely consistent with good accounting principles.

Q. Do you recognize any difference of principle with respect to the application of that rule as to whether or not it results in stating the actual cost under the code of accounts as it now exists?

A. I wouldn't agree with any other interpretation of it.

Q. Well; I know that, but do you admit that there is any other viewpoint taken by any accounting authorities?

A. Well, I know that it has been disagreed with because I heard Mr. Lusk disagree with it here.

Q. You recognize that these two companies were not subject to any regulatory control over their accounts prior to the adoption of the Federal Power Commission code?

A. Yes, I had that in mind all the way through my discussion. That is the reason why I made so many references to what they would do under the broad powers of the discretion of management.

Q. Is it your thought that this accounting code should be applied retroactively to the company's business back to the beginning of it in 1928?

A. The code probably speaks for itself in that respect.

I might summarize briefly what I think about it. When the company is called upon to reclassify its plant account in accordance with certain prescribed language in the code, it seems to me that the very nature of that undertaking does make certain features at least retroactive to the conception of the property or at least when the property was first devoted to the public service.

I believe the code is broad enough to apply any necessary restatement of depreciation or depletion back to the inception but as far as restating all of the income accounts which have been closed and reclassifying expenses for previous years on the basis of this new code, obviously that isn't contemplated.

The code became effective January 1, 1940, for natural gas companies and the only sense in which it retroactive is where the feature of being retroactive is necessarily unavoidable in meeting with the conditions laid down in setting up the plant account and the depreciations reserve.

Q. Do you agree that the importance of keeping the distinction between items that are to be expensed and items charged to plant account become much more important when a code of this order is established and when regulation of rates takes place than it was when there was no such regulation?

A. On account of the necessity of uniformity in regulation I believe that it does become more important under regulation.

Q. Then the fact that your original cost as shown on your books might be used by the regulatory body in determining rate base, doesn't that fact lend more importance to careful accounting as between plant and expense?

A. As to what weight a regulatory body would want to give to that sort of thing, I don't know.

Q. Well, then, your discussion of these principles and your application of them would be limited to a statement of what you think the books shows the original cost and you are not intending by this statement that these principles are recommended by you to be applied in the rate fixing process the Commission will exercise?

A. I am recommending that the original cost is to be considered by the regulatory body in computing the rate base be arrived at in accordance with the principles that I set forth here.

Q. That is, however, without reference to whether the regulatory body might want to determine cost of property by an inventory method or in any other method that might be advised?

A. It seems to me the regulatory body is free to go in

any direction it chooses. Of course I wouldn't give my sanction to it as an accountant—

Q. I take it, then, that your final position is the only original cost or the only cost figures on capital account of this company, the plant account, there should be considered are those as found on the books as adjusted and that you should not go out and determine actual cost of the property in any other way; that is, by taking an inventory and finding out what the actual cost is?

A. I believe you stated the books as adjusted?

Q. Yes. I will put it this way: It is the accurate book cost so you don't need to quibble about whether it was kept by the company or adjusted—

A. I believe that is the only satisfactory manner of computing original cost, to compute it upon the results shown on the books with due recognition to accounting errors and I don't think the inventory is worth the paper it is written on.

Q. And you still stick to that opinion, notwithstanding the fact that we might have an original and different cost of these two companies here depending upon how the books were kept?

A. Yes, so long as either method of accounting was within acceptable principles of accounting at the time and consistently followed.

Q. That would mean in instances of two companies who had followed consistently principles that were slightly different with respect to what should be capitalized and what should be expensed, then you would have for those two companies a different original cost to be submitted to the Commission for consideration in the determination of rates?

A. Yes, there would be a difference and of course that difference would tend to be offset by the difference in the depreciation and depletion reserve at any moment of time, and the nearer you approach the expiration of the property the less would be the difference.

Q. That is because after a long period of time you might have accrued annually through depreciation what you would have charged to capital in the first instance?

A. Precisely.

(Vol. LXXXXI, pp. 13927-13971.)

[Testimony of WILLIAM A. LUSK]

Q. Now, with reference to Item 8 on Statement 2, which is headed "Adjustment for Items Charged to Expense which are Properly Capital," are those items the ones that are covered by this memorandum which is referred to on Page 3 of the exhibit, being entitled "Items Charged to Expense on the books of the Colorado Interstate Gas Company during the period 1930 to 1939, inclusive, which should have been capitalized?

A. Yes, sir.

Q. You understand that that memorandum was furnished to the staff of the Federal Power Commission?

A. That was furnished in April of this year.

Q. Will you tell us just what you did in working out these adjustments as shown opposite Item 8 on Statement 2?

A. Well, I began with all of the maintenance and operation expense of the Colorado Interstate Gas Company. I had the assistance of practically six men in the Colorado Springs office of the Colorado Interstate Gas Company, and they assisted me, working there after hours. We set a program of four hours at night—from five o'clock until nine o'clock—and we worked approximately four weeks in putting together the data that is shown in that 400-page volume submitted to the Federal Power Commission, the summaries of which is shown in Line 8 of this exhibit, Statement 2. In general they represent maintenance and operating expense items which, according to my classification, should not have been expense but should have been capitalized.

Q. I take it that your investigation resulted in your finding only this amount of $284,806 as of the end of 1939?

A. That is accumulative, that $284,806. It represents the accumulation of $17,000 first shown in 1930 with accumulative additions each year.

Q. What were those items?

A. (Pause.)

Q. I don't mean for you to describe each one in detail, but can you give a general heading of them?

A. In general it consisted of the cathodic protection of the main line and laterals up to 1939. Subsequent to 1939 the expense of that particular operation is being capitalized.

Another large item is the rock-weighting of the main line itself. In other words, it was the placing of rock rip rap over the back fill of the pipe line to insure the line remaining down. From my own limited experience I have seen lots of lines under high pressures float.

Q. Is that when washouts occur?

A. That is when washouts occur, yes, sir, principally.

Q. And when you speak of the weighting, is that the placing of material on top of the pipe line?

A. The placing of rock on top of the back of it.

The Trial Examiner: That cost, Mr. Lusk, was charged to operating expense initially?

The Witness: Yes, sir.

By Mr. Dougherty:

Q. What other headings?

A. There is another item which amounts to quite a substantial sum and that is the rip rap and reinforcement of stream crossings to prevent soil erosion and washout of lines going across the streams. That has also been charged to expenses.

Q. Upon what basis or rule do you determine about these items that you have mentioned that they should properly have been capitalized and not charged to expense?

A. My reason principally behind that is that they are preventive and not corrective measures, and therefore should not have been expensed.

Q. Did you have anything to do with the setting up of accounts of this company in the beginning in 1927 and 1928?

A. No, sir.

Q. Do you know whether or not any uniform system of accounts was used as a guide in the setting up of the books?

A. The companies, the Colorado Interstate Gas Company, used the Pennsylvania code in setting up their accounts.

Q. That is the code of accounts as in effect in the State of Pennsylvania for the public utilities for that time?

A. Not now. That was in effect in 1929.

Q. Was it in effect in 1927 and 1928?

A. I wouldn't say.

Q. Was the date 1920? Was that when it was adopted?
A. That was when the code itself became effective.

Mr. Dougherty: I am going to ask you not to answer the questions until I finish them. The reporter can't take both of us down at the same time.

The Trial Examiner: All that system of accounts, that was prescribed by the Pennsylvania Public Utilities Commission?

The Witness: Yes, sir.

By Mr. Dougherty:

Q. That is for Public Utilities in that State?
A. Companies within that state, yes.
Q. Are you able to tell whether or not under that code of accounts these various adjustments for various items which you have found and charged to expense should properly be charged to capital?
A. May I refer to the code?
Q. Yes.
A. On Page 44 of the uniform classification of accounts for natural gas companies effective January 1, 1920, and issued by the Public Service Commission of the Commonwealth of Pennsylvania, in the paragraph under "Betterment," it states:

"Betterments are physical changes in structures or equipment, the object of which is to make the structures or equipment affected more useful or of greater capacity than they were at the time of their original installation or acquisition. The utility shall charge as a betterment to the appropriate sub-account of "101. Fixed capital installed since December 31, 1919" account that portion of the cost of such changes as will, when added to the original cost of the structures or equipment bettered, give the cost of the structures or equipment in their bettered condition."

Q. Under that particular provision which you have just read, is it your opinion that these adjusted items should have been charged to capital instead of expense?
A. I think so, yes. From my experience of long transmission pipe lines I am of the opinion they should have been capitalized and not have been charged under expense.

Q. Is it your opinion that whoever had to do with that in the company was in error in so charging it to expense?

A. I do.

Q. Now, with respect to Item 9 on Statement 2, will you give us the explanation of how those adjustments were arrived at?

A. Taking the net property addition year by year, I increased, or I included in Item 10 rather, six and one-half per cent for corporate engineering and other administrative costs.

Q. Is that 10 or 9?

A. 9. It is Line 9.

I included six and a half per cent for engineering corporate and other administrative costs on all net property additions, year by year and in addition to the six and a half per cent I included one and a half per cent for interest on those net fixed capital additions. The six and a half per cent applies to the item "Expense" which should have been capitalized as shown by Line 8, but the one and a half per cent interest was not computed on the expense item.

Q. What was it computed on?

A. The interest was computed solely on the items of fixed capital added during the year.

Q. And those are the one that are shown against Items 1 to 6?

A. That is right. They are incorporated in the total amounts shown by Item 1 to 6 inclusive.

Q. Were those interest items charged on the company's books?

A. No, sir.

Q. Why did you include them in this statement?

A. The Federal Power Commission code of accounts allows a nominal or reasonable amount, as they put it, of interest to be added to fixed capital when paid out of the company's own funds.

Q. Well, is that interest during construction?

A. As interest during construction.

Q. Are the computations you made in accordance with the provision of the Federal Power Commission code?

A. That is what I followed.

Q. I am speaking now with respect to the interest.

A. Yes, sir.

The Trial Examiner: The practice of the company during these years was to add interest during construction?

The Witness: No, sir, neither company had added interest during construction since the days of the initial construction period in 1928 regardless of the amount of additions and betterments they have put in.

(Vol. IX, pp. 1275-1281.)

* * * * *

Q. When did you first discover that some of these items had been expensed which should have been capitalized?

A. I was going through the maintenance item.

Q. What day?

A. What day?

Q. Yes.

A. Well, I commenced that particular job about—it was in the latter part of last year sometime or early this year.

Q. That is the first time that Ford, Bacon & Davis, Inc. had ever looked at its accounts, is that right?

A. Yes, sir. I can safely say that that is the first time Ford, Bacon & Davis, Inc., has seen those accounts since the initial construction.

Q. In making these adjustments in regard to these expenses, you say—did you take into consideration the Federal Power Commission uniform system of accounts?

A. I think I can say I followed that.

Q. What item did you follow?

A. Do you mind if I quote it, Mr. March?

Q. I would be glad to have you quote it.

A. It is the Federal Power Communications uniform system of accounts.

The Trial Examiner: For natural gas companies?

The Witness: Yes.

By Mr. March:

Q. Will you please refer to the page number? It is Page 49, Article 12. It states:

"Additions and retirements of gas plant." It is subdivision (3) under Provision B. It states:

"When a minor item of depreciable property is replaced—"

Mr. Lange: Mr. Lusk, is that from the tentative draft or is that of the final draft?

The Witness: No, sir, it is effective January 1, 1940, entitled "Federal Power Commission—Uniform System of Accounts — Natural Gas Company — Effective January 1, 1940."

By Mr. March:

Q. That is your gospel insofar as these adjustments you have made are concerned?

A. I think so. I think I can recall the quotation from Page 49 as I just mentioned it, and the Pennsylvania code was following, and I think I am on reasonably solid ground when I replaced these items.

Q. Read it.

A. Continuing to read it—

Q. Certainly. Read it.

A. "When a minor item of depreciable property is replaced independently of the retirement unit of which it is a part, the cost of replacement shall be charged to the maintenance account appropriate for the item, except that if the replacement effects a substantial betterment (the primary aim of which is to make the property affected more useful, more efficient, of greater durability, or of greater capacity), the excess cost of the replacement over the estimated cost at current prices of replacing without betterment shall be charged to the appropriate gas plant account."

Q. Does that say maintenance, cathodic protection, washout expense, protection against erosion shall be capitalized and not expensed?

A. When you mentioned maintenance expense, that was the account to which any of those items were charged but cathodic protection is definitely a betterment of a pipe line in that it arrests corrosion.

Washout control is definitely a betterment of a pipe line because it prevents the erosion of land and the consequent washing out and floating of a particular pipe line. Rock-weighting of the line is definitely a betterment because it also tends to lessen the effect of a washout.

Q. It is also a preventive, isn't it?

A. They are all preventive measures.

Q. I thought you said they were corrective—

A. I didn't say that. I said that they are preventive measures and not corrective measures. The definition of preventive measures are capital but corrective measures are properly expense.

Q. You would say that the quotations you have just read requires you to place such expense in the capital account?

A. I should think so, yes. I wouldn't say it would place such expense items—I would say it would place such expenditures for that particular work in capital.

Q. You don't really think that says that, do you? You just construe it to read that, don't you?

A. No, it says that right here (indicating.)

Q. By the way—

A. There certainly can be no misunderstanding if the use of the words "except that if the replacement effects a substantial betterment—" is considered. It is not a replacement but something that does effect a substantial betterment—

Q. Rock-weighting of a line is frequently a replacement?

A. It is frequently a replacement.

Q. Frequently a replacement?

A. When it is washed out.

Q. You have the washout included?

A. They aren't rock-weighted when the washouts occur.

Q. Did you have washouts after the line was rock-weighted?

A. There might be washouts after that occurred.

Q. That should have been expense, shouldn't it?

A. It should have been expense, and the chances are when I looked through the maintenance items when I saw anything that had the slightest inkling of replacements I did not include it in this particular computation.

Q. Where did you include it?

A. I left it in expense.

Q. Just how is it when you went through all of these vouchers you found a great many items which were expensed that should have been capitalized and did not find any items capitalized that should have been expensed?

A. I don't know as that is very difficult to define. Items that are capitalized that should have been expensed are because the chances are 99-to-1 that the companies are using the reverse process.

Q. Why would they?

A. In expenses, instead of capitalizing?

Q. Yes, why is that?

A. In the first place, if it is a border line of expense, why it is expensed.

Q. You didn't find items which were capitalized that should have been expensed, is that right?

A. I went through the expensed items—I can anticipate what you are driving at, Mr. March—for the years 1938 and 1939—you mean the write-off of certain items of fixed capital charged to expense?

Q. I mean just exactly what I asked.

A. A few items I found, yes.

Q. Did you put them over—

A. That may be the subject of another exhibit. It has no bearing on this.

Q. Did you or did you not?

A. Yes, I found items there.

Q. Did you put them over into the capital account?

A. I took them out of the expense account.

Q. Did you find anything that you took out of the capital account and put in the expense account?

A. No.

Q. These companies naturally would put all they could in the expense account, is that right?

A. Oh, I don't know. They could use their—

Q. Wouldn't it cut down on the income tax?

A. It might if the income tax examiner didn't catch it.

Q. It would?

A. But it would only be a stop gap. The Internal Revenue man would come along and they would have to replace it; pay the deficiency plus interest.

Q. Do you think that should be done here for all of this as improper expense, some $400,000, and you should be paying income tax on—

A. If you asked me to do it I would say yes.

Q. Do you think the whole procedure was improper and that they should have been in the capital accounts to begin with?

A. I don't think the use of the word "improper" is appropriate. I would say that it was just a slight error on the part of the clerks that handle the particular—

Q. How much do you figure this slight error meant in dollars and cents as far as income tax was concerned?

A. In 1939 the income tax on $17,000 wouldn't have been very much for the tax itself.

Q. I am talking not about $17,000, but $284,000.

A. Mr. Mareh—

Q. To be exact, $255,000—

A. That is accumulative to—

Q. Yes.

A. You have to pick out the individual years if you are talking about income tax. You can't pyramid these figures for tax—

Q. But you can do it for rate purposes?

A. They are accumulative. Part of them are pyramided year by year. They are entitled to be in there for accumulative value or accumulative dollars.

Q. I presume you have read the Federal Power Commission Uniform System of Accounts in toto?

A. Oh, yes.

Q. Did you read Page 37?

A. Yes.

Q. I will read, beginning with B on Page 36. It states:

"B. The cost to the utility of its gas plant shall be ascertained by analysis of the utilities records. In ascertaining the cost it is not intended that any correction need be made for depreciation, depletion, or amortization applicable to operating units or systems previously acquired, whether or not such depreciation, depletion, or amortization was recorded in the books of the accounting utility. It is likewise not intended that adjustments shall be made to record in gas plant accounts amounts previously charged to operating expenses in accordance with the uniform system of accounts in effect at the time or in accordance with the discretion of management as exercised under such uniform system of accounts."

A. Yes, I am familiar with that.

Q. I thought you said you abided by the Uniform System of Accounts?

A. I did. They don't tell you not to do it. They express the intent.

Q. They expressly say that it is likewise not intended that the adjustment shall be made to record in gas plant accounts—

A. They don't tell you it can't be done.

Q. They tell you they don't want you to do it, don't they?

A. That is right. If I told you I wanted you to jump off of the roof you wouldn't have to do it. (Laughter.)

Furthermore, Mr. March—

Q. If you are stating here that you are abiding by the Uniform System of Accounts as Promulgated by the Federal Power Commission in changing these items of expense to capital accounts, you are making an erroneous statement, aren't you?

A. No, I am not. Page 49 specifically states "betterment." That is one support for it. The Pennsylvania code of 1929 is another support for it.

Q. Yes, but you know and I know, and we all know, that according to this language that it absolutely says that such shall not be done after the accounts have been set up for a good many years, don't you?

A. I don't look at it that way. If the Federal Power Commission wanted it that way, they would have placed much stronger language on it than saying, "intended."

Q. What would they have said?

A. They would have said, "It is definitely out."

Q. What if they had said, "It is definitely out"? What would you have done?

A. I would probably have left them out.

Q. You probably would have left them out?

A. Yes. I would have to think a long while before I would leave them out.

Q. You don't like to abide by the intention of the Federal Power Commission Uniform System of Accounts, do you? You want them to knock you over the head with it, don't you?

A. No, whatever the word "intent" is, I don't pay much attention to it.

Q. You can do as your want to?

A. Do as I want to.

Q. Do you want to modify your statement to this effect: That you did not abide by the Federal Power Commission's Uniform System of Accounts when you changed from expense to capital accounts these items in all cases where the Federal Power Commission and the uniform system of accounts said or used the term "intended"?

A. No, I think my answer will stand because I am on safe ground on Page 49.

Q. Don't you think that Page 37 has to be read with Page 49?

A. There is still a great deal of confusion as to the interpretation of Page 37 and 49.

Q. Doesn't this language on Page 37 describe just exactly what you have done?

A. That is all right, and in the continuity Page 59 contradicts it somewhat then.

The Trial Examiner: Page 59 or 49?

The Witness: Page 49. Excuse me.

By Mr. March:

Q. You don't know whether it contradicts it or not?

A. I think it does. My interpretation of the language on both pages and on both sections—

Q. Who made that determination with you?

A. Nobody did. That is my own determination.

Q. Are you familiar with the Rules and Regulations of the Federal Power Commission and decisions of the Federal Power Commission construing this Uniform System of Accounts?

A. No, sir. I have read the Natural Gas Act and have gone through this particular Uniform System of Accounts, effective January 1, 1940, and I stopped there.

Q. What is the effect—so therefore you are not familiar with these interpretations of this Uniform System of Accounts?—

A. Not unless—

Q. —of the Federal Power Commission?

A. Have you finished the question?

Q. Yes.

A. Please read that question.

(The question referred to was read by the reporter, as set forth above.)

The Witness: Not unless included in the Federal Power Commission's Uniform System of Accounts effective January 1, 1940—

(Vol. IX, pp. 1299-1310.)

* * * * *

Q. I will ask the witness if he is familiar with this when I get through.

It is on Page 9. It states:

"Instruction 2-B, Utility Plant Accounts is as follows:

"'It is likewise not intended that adjustment shall be made to record in utility plant accounts amounts previously charged to operating expenses in accordance with the uniform system of accounts in effect at the time or in accordance with the discretion of the management as exercised under such uniform system of accounts.'

"Restatement of costs based upon revised allocations of joint expenses, (expenses applicable to construction and operations) cannot be permitted. Two self-serving, self-impeachments must be guarded against: 'Our records are in such bad shape that we cannot determine the cost of our property from our books and records' and 'we have not in the past properly distinguished between construction and operations and construction and maintenance'."

It states further: "The sentence of instruction 2-B quoted above sets forth the principle underlying the accounting reclassification required of utilities by the system of accounts. The intent of the reclassification is to reclassify the dollars in the plant account as of the effective date of the system of accounts to the new accounts."

I will end the paragraph here to make it complete.

It states: "The process is a reclassification and not a reaccounting. The utilities are required under the system of accounts to reclassify the dollars in their plant accounts as of the effective date thereof, and not to compute a hypothetical original cost of property constructed by them."

I will ask you if you have read that statement?

A. No, sir, I haven't.

I might add that you say that is from the National Association of Railroad and Utility Commissioners?

(Vol. IX, pp. 1312-1313.)

* * * * *

Q. Did you take into consideration all of the State Com-

mission's procedures when you determined to put these items in the capital account?

A. I think I am perfectly justified in placing those items in the capital account based upon the Code of Accounts followed by the company, and it is further supported by Page 49 of the Federal Power Commission Code of Accounts effective January 1, 1940. I think I am perfectly sound—

Q. And on Page 37—

A. Page 37, I think, is a contradictory statement and it doesn't say it should not be done. It says that it is the intention—the intention is thus and so, but it doesn't say just what you should exclude or what you should include.

Q. If this was in an expense account, how would the company get their money back out of this expense?

A. How would the company get its money back out of this expense?

Q. Yes.

A. Well, reverting to the company, it flows to the company through the gas rate, for the sale of gas—

Q. Would this be a profit—would this be in the profit and loss?

A. That expense item is in the profit and loss now and has been—if they treated it as an expense item—

Q. They have already made their money out of it once?

A. That is right.

Q. And you want them to make the money out of it again?

A. I didn't say that.

Q. What are you going to do—

A. I wouldn't say they made money out of the particular item.

Q. You don't?

A. I don't know. No one else knows if they have received a fair return.

Q. No one knows if he has received a fair return?

A. No.

Q. You don't know whether they have enjoyed a return at all, is that right?

A. No.

Q. You haven't made sufficient examination of the books, records, and accounts of this company to ascertain it?

A. I have made sufficient examinations from that view-

point, but I am speaking now of sufficient return on the value of the property.

Q. Oh, yes.

What return would you allow them on the value of the property?

(Vol. IX, pp. 1315-1316.)

* * * * *

Q. Mr. Lusk, I refer you back to Statement 2 of Exhibit 67.

A. Yes, sir.

Q. I refer you specifically to these items which you have charged to the capital account which was formerly expense.

A. Yes, sir.

Q. Did you see the vouchers in regard to those items?

A. Yes, sir. I reviewed and inspected every voucher.

Q. The tickets?

A. No, not all the tickets.

Q. Did you try to read any of those tickets?

A. Sir?

Q. Did you try to read any of those tickets?

A. I had quite a difficult time in reading some of them.

Q. You can't tell just exactly what services were performed by reason of the tickets, could you?

A. I think we can, yes, sir.

Q. You can't read them, can you?

A. Read them?

Q. You can't read them, can you?

A. I said that I had a little difficulty in reading some of them.

Q. Could you read all of them?

A. Practically all of them except the few I had the difficulty with reading.

Q. Just how did you have difficulty in reading those few? In what respect was it?

A. In many respects the time charged was not very clear. The item of maintenance was not very clear. I believe I mentioned yesterday in my testimony where there was any doubt in regard to the words "replacement" or "repair"—where they appeared in any of those tickets I didn't consider them.

Q. In other words, you didn't consider that there was any doubt at all?

A. No, I don't believe I did.

Q. And you didn't attempt to read all those tickets yourself?

A. No, sir.

Q. It would be impossible?

A. It would be a physical impossibility for one man to read the thousands of labor tickets.

Q. What were your instructions to your subordinates in regard to that?

A. My instructions to my subordinates were to take off from the time tickets every item that read particularly cathodic protection, if any, rock-weighting the main line, hauling shale for the main line, building of bridges, and revetments, and rip rapping on the main line, and all such items that appear to make up Item 8.

Q. And if there was any doubt in their minds as to just what the ticket did say in that regard they were to ignore it?

A. No, they brought the questions to me and I made the decision.

Q. You made the decision?

A. Yes, sir.

Q. Were large sums involved in those decisions?

A. I would say there was a substantial sum—if I took every time ticket it would be substantially in excess of the amount shown here (indicating Exhibit No. 67.)

Q. What do you mean, if you had that noted?

A. If I just simply adopted the policy of taking every time ticket that had something on it that I or someone particularly — particularly myself — that should be capital and include it in this, it would be substantially in excess of that amount.

Q. How much in excess?

A. I haven't any idea.

Q. You were trying to make this figure as small as possible?

A. No, sir, I was pursuing a definite line.

Q. All right.

Now I want you to refer back to Items 1 to Item 6 on Statement 2. You distributed there, I believe, $295,000 of undistributed items to these functional groups?

A. That is right.

Q. Well, weren't some of the functional groups already retired?

A. If they were—

Q. Answer the question directly.

A. Yes, they were in small parts, yes, sir.

Q. What did you do in a case like that?

A. There was no change made in that particular item for the small portion of property retired.

Q. In other words, you are going to let the rate payers pay twice for that?

A. No, I wouldn't say that, because down in Line 9 where I make the adjustment for general construction costs applicable to net property additions and capital items expensed, that item is taken care of. The general cost is distributed on the net, not on the gross.

Q. How much does this amount to? How much in dollars and cents, these function units that have been retired?

A. I couldn't tell you offhand, Mr. March.

Q. Can you get that information for us?

A. I can look it up, yes.

(Vol. X, pp. 1342-1346.)

* * * * *

The Trial Examiner: Mr. Lusk, will you turn to Statement 2 of Exhibit No. 67 for identification?

The Witness: Yes, sir.

The Trial Examiner: On Line 9 you show certain amounts under the caption "Adjustment for General Construction Costs Applicable to Net Property Additions and Capital Items Expensed." That is an accumulative figure up to $155,244 that accumulated each year?

The Witness: Yes, sir.

The Trial Examiner: Mr. Lusk, are you referring there to administrative overhead?

The Witness: Yes, sir.

The Trial Examiner: Is there a provision in the Pennsylvania Code that you had here yesterday that provides for the charging or the allocation of proportionate amounts of administrative expense to capital?

The Witness: In the Pennsylvania Code there is a provision for general administrative expense to be capitalized. It doesn't say that under the specific accounts that portions

shall be distributed to the individual accounts but there is under the Pennsylvania Code a capital account for undistributed or general construction cost.

The Trial Examiner: I wonder if you would turn to that and read it for the record?

The Witness: Yes, sir.

On Page 48 of the Pennsylvania Code of Accounts, dated or effective January 1, 1920, and continuing on Page 49, Page 48 being under the general heading "Undistributed Fixed Capital Accounts."

Account 200 is Organization; Account 201 is Franchises; Account 202, Patent Rights and Licenses; and Account 203 is Other Undistributed Fixed Capital.

Account 203 states: "Charge to this account the cost of all other undistributed fixed capital not provided for elsewhere.

"The record supporting the entries to this account shall be so kept that the utility can furnish information as to the kind of each item of fixed capital charged to this account, the principal from whom it was acquired and the agents who represented him; also the term of the life of each item, or if it is not known an estimate thereof and the facts upon which such estimate was based."

Account 203 is an overall account. In the accounts of the Colorado Interstate Gas Company they have an account 203 Other Undistributed Fixed Capital.

The Trial Examiner: Is that the only specific provision in that system of accounts for the allocation of administrative overhead?

The Witness: No, sir. On Page 59 under "Undistributed Construction Expenditure Accounts" there are the following:

Account 258, Engineering and Superintendence during construction; Account 259, General Officers' and Clerks' Salaries during construction; Account 260, General Officers' and Clerks' Expenses during construction; Account No. 261, Office Supplies and Expenses during construction; Account 262, Law Expenditures during construction; Account 263,

Injuries and Damages during construction; Account 264, Insurance During Construction; Account 265, Taxes during construction; Account 266 Interest during construction; and Account 267, Other Expenditures during construction.

They are all provided in the capital accounts of the Pennsylvania Code of 1920.

The Trial Examiner: Are they somewhat similar to the present provisions of the Uniform System of Accounts prescribed by the Federal Power Commission?

The Witness: Yes, sir.

The Trial Examiner: Do they vary to any great extent?

The Witness: I couldn't say so. I haven't made a great comparison, but generally they are the same.

The Trial Examiner: Item 12 on Statement 1 was reached in the same identical manner, was it not, with the exception of the interest rate?

The Witness: No, sir. In the case of the Canadian River Gas Company I added three and a half per cent allowance; in the case of the Interstate Gas Company I added a six and a half per cent allowance.

The Trial Examiner: Did you add a three and a half per cent allowance for administrative expenses alone in the case of the Canadian River?

The Witness: In the case of the Canadian River.

The Trial Examiner: And what appears for Colorado Interstate?

The Witness: One per cent for interest.

The Trial Examiner: And to Colorado Interstate you used six and a half per cent which included one and a half per cent interest—

The Witness: No, exclusive of the one and a half. One and a half and six and a half.

The Trial Examiner: I am reading from Page 1280 of yesterday's record. It—did you not testify here—"I included six and a half per cent for engineering corporate and other administrative costs on all net property additions—" —I see there what you mean.

The Witness: Yes.

(Vol. X, pp. 1355-1359.)

* * * * *

Q. Mr. Lusk, there was considerable discussion yesterday of the principle followed by you and what you did in connection with the adjustments made of items that had previously been charged to expense and which in your compilation of the original costs, as shown in Exhibit No. 67, you capitalized. Reference was made to a provision of the newly adopted Uniform System of Accounts for natural gas companies by the Federal Power Commission and which became effective January 1, 1940. On Page 37, which is under Section 2, bearing the *hearing* "Classification of Gas Plant the Effective Date of System of Accounts," there is a Paragraph B that deals with the matter of setting up the accounts in accordance with this new classification. Do you understand that the accounts of the Natural Gas Companies that are subject to the Natural Gas Act are expected to be reclassified in accordance with the provisions of this adopted code of accounts?

A. Yes, sir.

Q. And the account numbers as contained herein would be assigned on the books?

A. Yes, sir.

Q. Now, in the first sentence it says: "The cost to the utility of this gas plant shall be ascertained by analysis of the utility's records," and that ends that sentence.

Did you analyze the records of both Canadian River and Colorado Interstate Gas Company in making your statement of original costs?

A. Yes, sir.

Q. Now, the second sentence deals with depreciation and amortization. Was there any question respecting any of those items dealt with in this exhibit?

A. No, sir.

Q. Now, the third sentence which attention was called to reads this way:

"It is likewise not intended that adjustments shall be made regarding gas plant accounts, amounts previously charged to operating expenses in accordance with the uniform system of accounts in effect at the time or in accord-

ance with the discretion of the management exercised under such uniform system of accounts."

That ends the quotation.

Now I want to discuss the problem with you under the assumption that that is *manitory* in the sense that it says that no adjustment will be made in making this reclassification to record in the gas plant accounts the amounts previously charged to operating expenses that are stated here. What is your understanding as to whether that would mean that under no circumstances are any adjustments to be made of interest that at one time had been put into the expense account?

A. It is my understanding that the Federal Power Commission there doesn't prohibit the replacement of items previously charged to expenses.

Q. That's what I'm getting at. It doesn't make a blanket prohibition against—

Mr. March: I object to that. It's a legal question, a legal determination and the witness construing this uniform system of accounts from a legal standpoint is improper

The Trial Examiner: Well, from the standpoint of legal construction I think perhaps that's right. The Examiner is rather interested, Mr. March, in Mr. Lusk's interpretation of the system of accounts. Mr. Lusk is an expert accountant.

By Mr. Dougherty:

Q. Now, it further reads that the adjustments that are not to be made are these:

"Those amounts previously charged to operating expenses in accordance with the uniform system of accounts in effect at the time."

Now, I'll ask you if—assuming that certain charges had been made to expense that were directly contrary to the provisions of some uniform system of accounting—it is your interpretation or understanding of this provision that no adjustments are to be made where such charges had been made directly contrary to such systems.

A. My interpretation of that provision is that where a

company operating under a code of accounts like the Colorado Interstate Gas Company and the Canadian River Gas Company under the old Pennsylvania Code, that they would be perfectly justified in reversing those expense items because under that particular Pennsylvania Code the items that were expensed in my opinion were accounting errors.

Q. Well, now, I want to get you—I am asking you these questions as to interpretation without direct reference as to what you did, as yet, Mr. Lusk, and I want to put a hypothetical question to you and—first, I'll ask you this:

Does the Pennsylvania Code of Accounts contain any accounts under their gas plant group for compressors?

A. Yes, sir.

Q. And where does that Code of Accounts provide that compressors shall be charged?

A. Fixed capital.

Q. Will you give us what account number that is?

A. I am reading from Statement 2 of Exhibit 67, "Compressing Stations: Accounts 218 — land; 219 — leaseholds; 221—Structures; 223 — Structures; 224 — Equipment; 227—Equipment."

They are the Codes of Accounts listed under the Pennsylvania Code and which the Colorado Interstate Gas Company and the Canadian followed.

Q. Now, let's assume that all of the compressor stations and property of the Colorado Interstate Gas Company had been expensed on the books; that is, charged to operating expenses rather than charged into capital in the various years in which these expenditures were made.

Would it be your opinion that entries so made were contrary to the provisions of the Pennsylvania Code?

A. They most decidedly would be.

Q. And in making a re-classification or re-statement of gas companies' accounts in accordance with the Federal Power Commission Code, would it be your understanding that you should make those adjustments and take those items out of expense and put them into the proper capital account item?

A. Yes, sir.

Q. Now, you used the term yesterday at different times of, I think, "Border Line Items," or cases?

A. I did.

Q. Are those cases in which some discretion of management could be exercised as to whether they would go on one side or the other; that is, either into expense or capital?

A. I think that is the proper term, yes, sir.

Q. Now, the items that you did actually investigate and the adjustments which you have made, state whether or not in your opinion, when made, were they or were they not contrary to the rules provided in the Pennsylvania Code of Accounts which this company was then following?

A. I think they were a direct violation of the specific following of the Pennsylvania Code of Accounts, the Code of Accounts that both companies use now and have been using since 1928.

Q. And you put those in the same general class as the illustration I mention; that is, compressor stations?

A. Yes, sir.

Mr. Dougherty: I think that is all.

Mr. March: I have a few other questions here.

The Trial Examiner: Mr. March, may I ask a question just before you get to it?

Mr. March: Yes, sir.

The Trial Examiner: Mr. Eusk, this matter of charging these large items such as your cathodic improvement or treatment of the lines, rather, and your rock-weighting and rip rapping, would you say that was a border line incidence?

The Witness: No, sir, decidedly not.

The Trial Examiner: Wherein discretion would be exercised by the accounting officers?

The Witness: No, sir.

The Trial Examiner: Wouldn't those charges conform to established policy of the company?

The Witness: No, sir. Those particular items are strictly betterment items to improve the pipe line.

The Trial Examiner: What I mean, though, the initial charges were made to operating expense?

The Witness: That's right.

The Trial Examiner: And not to capital outlay?

The Witness: That's correct.

The Trial Examiner: Well, that is an item of rather major importance, is it not, wherein it would be rather difficult to make an accounting error in the entrance of those items on the books of the company?

The Witness: Well, the way those particular accounts were handled, if the Pennsylvania Code were strictly followed, they should be capital.

The Trial Examiner: Your Pennsylvania Code lays down certain general rules, does it not, and then beyond those rules as an accounting matter you have a wide area of discretion; isn't that true?

The Witness: That's true.

The Trial Examiner: And the fact that these items were directly charged to operating expense wouldn't necessarily conflict with your Pennsylvania Code, would it?

The Witness: I think they would, yes, sir.

The Trial Examiner: Mr. March, you may proceed.

Recross Examination.

By Mr. March:

Q. So you have set up the accounts of the Canadian River Gas Company and the Colorado Interstate Gas Company in compliance with the uniform system of accounts of the Federal Power Commission?

A. No, I haven't.

Q. They have never been set up in compliance with the uniform system of accounts of the Federal Power Commission, have they?

A. That's quite right. They have not.

Q. Why haven't they?

A. Well, I couldn't answer that question. That's a legal matter.

Q. You just got busy and set up a few of them here for this rate case in this exhibit, is that right?

A. No, I wouldn't say that. In fact, I don't do anything piecemeal. I go the whole way.

Q. And your company has made no attempt to set up its accounts according to the uniform system of accounts of the Federal Power Commission?

A. They may have in some of the other exhibits that may be presented later.

Q. I'm talking about the company as a whole, the accounts of the two companies.

A. They haven't set those accounts up in accordance with the Federal Power Commission uniform system of accounts as yet.

Q. In the preparation of this exhibit you decided that it would be a nice thing if you could put this $400,000 from expenses into capital accounts under the guise of compliance with the uniform system of accounts of the Federal Power Commission, is that it?

A. No, sir. I strictly followed the Pennsylvania Code, which they are operating under now.

Q. Why do you refer here so much to the Federal Power Commission?

A. I didn't.

Mr. Dougherty: He didn't. I did.

By Mr. March:

Q. Yes, but you quote with a great deal of glee from the Code of the Federal Power Commission as requiring that and you give that as a reason for your so changing it from expense to capital structure.

A. That isn't the reason. The reason is the Pennsylvania Code.

Q. Oh, the Pennsylvania Code was changed, is that right?

A. No, sir; No, sir, but the items that are capitalized are charged to expense in the Pennsylvania Code.

Q. They have changed the Pennsylvania Code recently, haven't they?

A. Recently, yes.

Q. And it corresponds very close to the Federal Power Commission, doesn't it?

A. I understand it does.

Q. However, this wasn't in conflict with the Pennsylvania Code until the change was made?

A. That's right.

Q. Do you know when they changed the code—I mean the uniform system of accounts?

A. No, I don't recall.

Q. Have you ever seen the uniform system of accounts of the Pennsylvania Code now in effect?

A. No, I don't think I have.

Q. How do you know they changed, then?

A. I know the State of Pennsylvania and West Virginia have adopted a new code similar to the one that has been issued by the Federal Power Commission.

(Vol. X, pp. 1366-1376.)

As to the cost of necessary additions to Colorado Interstate's portion of the Denver Line, 1940 to 1947 inclusive, as estimated, the company introduced Exhibit 133 by its witness Lusk. This exhibit also included cost of additions to Canadian River's portion of the line, which is dealt with in its brief. In this Exhibit 133, the witness Lusk priced out and totaled up the cost of such necessary additional facilities based on estimates furnished him either by the engineer Rhodes, or Hendee, general manager (Vol. XXXIII, p. 4253 to 4285). The costs of the added facilities were largely based on actual cost of the Dalhart Compressor Station completed in 1940 (Vol. VIII, p. 1084), and on estimates furnished by Mr. R. W. Hendee, general manager (Vol. XXXIII, pp. 4255, 4256). Lusk stated that: "Other than for changes made necessary by the required new facilities, there were no allowances for the cost of incidental facilities, commonly provided in the development of a property." (Exhibit 133, p. 1). His exhibit sets forth the cost of the estimated necessary additional facilities by or in accordance with the estimate as to when they would be required. The total amount of such additions through 1947, he summarized as follows: Extension to Canyon Compressor Station, $73,472; extension to Devine Compressor Station, $75,000; new Colorado Springs Compressor Station, $177,590. These three items added to its original cost at December 31, 1939 of $12,081,142 would result in an original cost of the physical properties of Colorado Interstate's portion of the Denver Line at December 31, 1947 of $12,407,204. Ex. 133.

COLORADO INTERSTATE GAS COMPANY

STATEMENT OF INCOME AND SURPLUS ACCOUNTS, AS RECLASSIFIED (SEE FOOTNOTE), FOR THE NINE MONTHS ENDED SEPTEMBER 30, 1940 AND 1939 AND COMPARISON

COLORADO [illegible] COMPANY
INVESTMENT [illegible] RECLASSIFYING
RATE CASE EXPENSES

Particulars (1)	1940 Debit (2)	1940 Credit (3)	1939 Debit (4)	1939 Credit (5)
No. 1				
Operating expenses			$ 3,524.30	
Operating expenses - miscellaneous general expenses (Colorado Springs office)		$ 460.05		
Surplus - 1939				$ 3,524.30

To reclassify to normal operating expenses the regular time of regular employees carried on the private pay roll which was charged to work orders 345 (valuation report) and 351 (physical inspection of pipe line). The following accounts charged by this entry are those which it appears would have been charged, based upon the time distribution of each employee, had the rate investigation not been in progress:

Account	Nine Months Ended September 30, 1940	Nine Months Ended September 30, 1939
Transmission Expenses		
Transmission system supervision		$ 330.10
Other transmission system labor		845.11
Compressing system superintendence		163.12
Distribution Expenses		
Distribution system office salaries	$ 57.28	314.96
Operation of field measuring stations	70.04	712.70
General and Administrative Expenses		
Other general office salaries	332.13	985.91
Telephone system labor		88.50
Land department labor		53.64
Totals	$460.05	$3,524.30

The charges during 1939 to work orders 346 and 351 were closed to expense in December 1939. The charges to these two work orders during 1940 were closed to expense monthly.

No. 2

Deferred debits (Deferred Rate Case Expenses)	56,316.55		58,290.20	
Operating expenses (detailed below)		56,316.55		3,286.04
Surplus - 1939				55,004.16

To reclassify the following operating expenses to deferred rate case expenses:

	Nine Months Ended September 30 1940	Nine Months Ended September 30 1939	Three Months Ended December 31, 1939
Miscellaneous general expenses			
New York Office	$ 3,161.80		
Colorado Springs Office	43,696.12		$51,797.21
Special legal services	9,377.80	$ 3,197.21	3,184.95
Rent	80.83	88.83	22.00
Totals	$56,316.55	$ 3,286.04	$55,004.16

Notes:

(1) The Examiner has reclassified to operating expenses the pay roll charges representing the regular time of regular employees which were charged to the rate case expense work orders. The amounts are shown below by work orders and by periods:

Period	Valuation Report (Work Order 346)	Physical Inspection (Work Order 351)	Total
Year 1939 (reclassified by Examiner's entry No. R-152, in exhibit covering 1939 income accounts)	$2,676.06	$1,002.91	$3,678.97
Nine months ending September 30, 1940 (reclassified by Examiner's entry No. 1, Schedule No. 3)	460.05		460.05
Totals	$3,136.11	$1,002.91	$4,139.02

(2) Ford, Bacon & Davis, Inc. work was billed at cost of services plus 10%, plus overheads approximating 75%, plus expenses at cost.

[Testimony of Witness Early]

Q. Mr. Early, I will ask you whether in connection with your accounting work on the Colorado Interstate Gas Company's books in this proceeding you have also prepared another exhibit entitled "A comparison of operations of Colorado Interstate Gas Company for the nine months ended September 30, 1940 and 1939, and balance sheet at September 30, 1940"?

A. Yes, sir, I did.

Mr. Lange: I would like to have the reporter identify this document.

The Trial Examiner: It will be marked for identification as Exhibit No. 173.

(Exhibit 173, Witness Early, marked for identification.)

By Mr. Lange:

Q. Mr. Early, did you also in the preparation of the exhibit prepare a written statement briefly outlining the contents of the exhibit?

A. Yes, sir, I did.

Q. Will you please read that into the record?

A. "The principal purposes of this exhibit are as follows:

"(1) To present a comparison of operations of Colorado Interstate Gas Company for the nine months ended September 30, 1940 and 1939.

"(2) To present the expenses incurred by Colorado Interstate Gas Company in connection with this rate case up to September 30, 1940.

"(3) To present the changes in the investment of Colorado Interstate Gas Company in gas plant in service for the nine months ended September 30, 1940.

"The schedules forming this exhibit and which present the detail supporting the purposes as explained in the previous paragraph are as follows:

"Schedule No. 1 Statement of income and surplus accounts as reclassified for the nine months ended September 30, 1940, and 1939 and comparison.

"Schedule No. 2 Statement of operating expenses, as reclassified, for the nine months ended September 30, 1940, and 1939 and comparison.

"Schedule No. 3 Examiner's Entries reclassifying rate case expenses.

"Schedule No. 4 Balance sheet, as reclassified, September 30, 1940.

"Schedule No. 5 Deferred rate case expenses September 30, 1940.

"Schedule No. 6 Gas Plant in service September 30, 1940.

"All of the figures used in this exhibit are those shown by the books at the dates stated in the schedules after giving effect to rate case expenses removed from operating expenses and reclassified as deferred rate case expenses.

"Results of Operation

"Net utility income, as shown in Schedule No. 1, decreased $99,225.03 for the nine months ended September 30, 1940, as compared with the nine months ended September 30, 1939. The decrease in the result of changes in the following operating accounts:

	Increase (Decrease) 1940 over 1939
Operating revenues	$204,056.58
Operating revenue deductions:	
Gas purchased for resale	72,730.44
Operating expenses	17,898.04
Depreciation	61.96
Amortization	.....
Taxes	212,591.17
Total	$303,281.61
Net untility income	($ 99,225.03)

"The increase in operating revenues resulted primarily from greater consumption of gas for residential and com-

mercial use, both spaceheating and regular. Also operating revenues per the company's books for 1939 are after a reduction by $73,560.57, due to the reversal made on the books in January 1939 of unbilled revenue accrued as of December 31, 1938. The company did not record a comparable accrual as of December 31, 1939.

"The increase in gas purchased for resale is due principally to the purchase and sale of a larger volume of gas. The increase of ¼¢ per Mcf. in the cost of gas purchased during 1940 is occasioned by a reduction in the sales price to Canadian River Gas Company of gasoline approximately fifty per cent. Revenues from gasoline enter into the computation of the gas rate.

"The fluctuations accounting for the net increase in operating expenses in the amount of $17,898.04 are detailed in Schedule No. 2 by functional groups. The most extraordinary fluctuations which caused this increase and the explanation therefor were found in the following accounts:

Transmission Expense

Maintenance—Transmission System Line Equipment

"The increase of $18,796.25 in this account is due principally to the soil resistivity survey work carried on in 1940. The expense in 1939 in connection with this work was recorded and carried in construction work in progress until cleared to expense in December 1939. During 1940 such charges were distributed to expense monthly.

"Transmission Expense

Maintenance—Transmission System Other Equipment

"The decrease of $24,979.12 in this account is primarily due to expenditures for flood control made during 1939.

"Transmission Expense

Maintenance—Compressing System Equipment

"The increase of $9,251.60 in this account resulted from major repair items (pistons, cylinders, etc.) required by the compressors in 1940.

"Sales Promotion Expenses

Labor and Miscellaneous

"Sales promotion expenses in 1940 consist of the following:

National Biscuit Co., Denver, Colo:		
Payroll charges for estimating requirements for new load	$ 104.47	
Contribution to Public Service Company of Colorado	1,000.00	$1,104.47
Nuckolls Packing Co., Pueblo, Colo.		
Payments to Nation Tube Company and Standard Oil Company of New Jersey for pipe and freight		8,514.12
Total		$9,618.59

"These expenses may be considered nonrecurring because no further payments in connection with either National Biscuit Company or Nuckolls Packing Company are anticipated.

"Taxes increased in the amount of $212,591.17 of which $191,000.00 represents accrued Federal income taxes.

"Financial

"Schedule No. 4, the balance sheet at September 30, 1940, reflects the balances as shown by the books with the exception that rate case expenses are reclassified in accordance with the footnote on that schedule.

"The most significant change in the balance sheet since December 31, 1939, is the collection of the loan made to Standard Oil Company of New Jersey which amounted to $600,236.98 at December 31, 1939.

"The suspense account came into use after December 31, 1939, and the balance therein at September 30, 1940, is the result of the following transactions:

"Debit

"Note of Ford, Bacon & Davis, Inc. transferred from notes receivable in May 1940. Arkansas Valley Natural Gas Company was the recipient of the funds advanced for this note		$67,500.00
"Credits		
"Note receivable from Arkansas Valley Natural Gas Company	$10,000.00	
Arkansas Valley Natural Gas Company assets acquired:		
Materials and supplies	6,760.70	
Furniture and fixtures	612.87	
Sundry	204.30	
Cash received	5,000.00	22,577.87
Balance September 30, 1940		$44,922.13

"Changes in gas plant in service for the nine months ended September 30, 1940, are summarized by accounts in Schedule No. 6 and classified between additions and retirements.

"Description of the major additions and the plant accounts to which charged are as follows:

"226 Line Equipment		
"Work orders covering cathodic protection		
No. 362 Main Line	$ 639.75	
No. 364 La Junta and Arkansas Valley	4,523.22	
No. 374 *Fitzsimmons*	2,059.38	
No. 375 North	922.74	$ 8,145.09
"Other		
No. 377 Bridge across creek	470.98	
No. 378 Repairing *Purgatorie* Bridge	1,036.54	
No. 381 Replacing joints	678.65	
No. 382 Repairing washout	2,791.73	4,977.90
		$13,122.99

"224 Compressing Equipment
"Work Order No. 359 covering 1-600 H.P. compressor installed at Canon station $36,735.72

"322 Measuring Station Structures
"Work Order No. 369 covered one-room addition to 5-room house, Denver station $ 1,770.35

"227 Measuring Station Other Equipment
"Work Order No. 366 covered flood water control work at Denver station $ 1,044.03

"256 General Property—Tool and Implements
"No. DI-35, 1940 covers the purchase of one earth drill for truck mounting $2,289.08"

Q. In connection with the preparation of this Exhibit 173 I will ask you first whether this exhibit was prepared by you and the figures were obtained from the company's books and records.

A. By me and under my supervision.

Q. By you and under your supervision?

A. Yes, sir.

Q. Where did you obtain these figures you report in your exhibit at the company's offices?

A. The figures were obtained in part from the Colorado Springs office, that is, from the books and records kept there and in part from financial statements sent to me from the New York office.

Q. The New York office of the Colorado Interstate Gas Company?

A. Yes, sir.

Q. And are these figures all as per books?

A. They are all as per books with the exception that rate case expenses have been removed from the operating accounts and set up as a deferred account on the balance sheet.

Q. Where does that appear—on what page?

A. Page 6 shows on the left-hand side near the bottom under "Deferred Debits" the deferred rate case expenses. Those are detailed on the following page.

Q. In Schedule 5, Page 5?

A. Yes, sir.

Q. And that continues over on Page 6?

A. That is correct.

Q. In all other respects were these figures as per books of the company?

A. That is correct.

Q. Now referring to Page 1 of the exhibit, have there been any computations made by you in connection with that Schedule 1 appearing on that page?

A. Yes, there have.

Q. Which columns and which items?

A. Columns 3, 5, 6, and 7 are the results of computations showing statistical data in regard to the operations of the two nine-months periods.

Q. Columns 2, 5 and 7?

A. No, Columns 3, 5, 6 and 7. They are on Page 1.

Q. Page 1?

A. Yes.

Mr. Lange: That is all for the present, Mr. Early.

Cross Examination.

By Mr. Dougherty:

Q. Mr. Early, in your written statement where you speak about sales promotion expense, labor and miscellaneous, you have down here at the bottom of the page "Payments to National Tube Company and Standard Oil Company of New Jersey for Pipe and Freight." Does that represent pipe purchased by the company in that year?

A. (Pause.)

Q. I don't quite get the tieup in between it. You have "sales promotion expenses in 1940 consist of the following:" and you start out with the National Biscuit Company, Denver, Colorado, and then you have the statement "Payments to National Tube Company." I don't tie that in with what you call sales promotion expenses.

A. It is my understanding that the pipe and freight, valued at a little over $8500, were paid for by Colorado Interstate Gas Company and the pipe is used to connect up the Nuckolls Packing Company in Pueblo, Colorado, to the distribution system of the Pueblo Gas & Fuel Company.

Q. That is probably pipe that has been given to the Pueblo Gas & Fuel Company?

A. That is correct.

Q. And the payments, then, represent the amount paid for the pipe which was so used?

A. That is correct.

Q. You mentioned about repayment of a loan made to Standard Oil Company of New Jersey in the amount of six hundred thousand and some-odd dollars. Are you familiar with the terms of the loan?

A. No, I am not.

Q. As I recall it, I thought it was your exhibit that you spoke about the deposit by Colorado Interstate Gas Company with the Standard Oil Company of New Jersey of balances from time to time as they had them available, and I thought that in that exhibit there was something said about "these were repayable upon demand." Am I correct in my recollection?

A. I believe I recall the latter portion of that, that they were payable upon demand.

Q. And this $600,000, did not that represent that advance that has been so carried with the Standard Oil Company of New Jersey under the terms we just mentioned?

A. Yes, that is the same account.

Q. And the result of this is simply that practice was changed?

A. I do not know that the practice was changed or that Colorado Interstate Gas Company merely demanded the payment of this loan. Anyway, it was converted to cash.

Q. In the sense of the term "loan," that was not any long-term or short-term loan represented by a note: it was just an open-book advance?

A. That is correct.

Q. Did you make inquiry to find out whether the practice of carrying these amounts on deposit with the Standard Oil Company of New Jersey had been discontinued at the end of 1939?

A. No, I did not make that investigation. In fact, my working papers indicate that deposits were made into this account as late as June or July 1940.

Q. There were none shown after that?

A. At the end of September the account was wiped off.

Q. You did know, I assume, for some period of time that interest was paid Colorado Interstate Gas Company on those advances?

A. Yes, I recall that a small amount of interest was paid on those advances.

Q. Referring to Statement 1, Page 1, I guess it is, your income account for 1939, as you show it, differs in what respect from your income account as shown in your Exhibit No. 140 for 1939?

A. You mean as to its form?

Q. No, as to its figures; that is, I want to know whether or not the figures which you have here for 1939 in this Exhibit 173 represent the same figures, the same adjustments which you have made and as are shown in your Exhibit 140 for the year 1939.

A. No, that is not the case. This Exhibit No. 173 shows only the nine months of operations of 1939 in order to present a comparison with the same period of 1940. Exhibit No. 140 covered the full year 1939.

Q. Have you made adjustments for the nine months of 1939 so far as you could which were made for the same year in Exhibit No. 140?

A. No, I have not. The only entries applying to the company's book figures are those necessary to remove the rate case expenses from the operating accounts and then set them up as a deferred account in the balance sheet.

Q. So that with that exception these were taken right from the books?

A. That is correct, from the books and the financial statements.

Q. And the amounts here for depreciation and amortization are as per books?

A. That is correct.

Q. If you had not removed the rate case expense that would have made a difference in the computations you made of the cents per Mcf. applied to the different items?

A. That is correct.

(Vol. XLIX, pp. 6769-6781.)

---

19. Cost of Contracts of Colorado Interstate.

In addition to its physical properties, Colorado Interstate acquired and paid for its gas purchase contract with

Canadian dated January 3, 1928 (Exhibit 16), and its gas sales agreement with Public Service and Pueblo Gas and Fuel Company, also dated January 3, 1928 (Exhibits 7-I and 7-H respectively), and its gas sales agreement for sales to Colorado Springs (Exhibit 7-E). These contracts, and some of the evidence surrounding their negotiation, have been abstracted supra. The respondent, through its witness Lusk, in Exhibit 77, presented the book cost of such contracts as follows:

"(a) Gas purchase agreement dated January 3, 1928 with Canadian River Gas Company, $2,000,000.

"(b) Gas sales agreements dated January 3, 1928 with Public Service Company of Colorado and Pueblo Gas and Fuel Company, respectively; $352,941.17.

"(c) Gas sales agreement dated June 12, 1931 with City of Colorado Springs, Colorado, $236,666.67; total, $2,589,607.84.

"As a part of the consideration to be received by Canadian River Gas Company for entering into the agreement described under Item (a) above, Colorado Interstate Gas Company issued to Southwestern Development Company, as nominee of Canadian River Gas Company, 531,250 shares of its no par value common stock and 10,000 shares of its preferred stock ($100 par value).

"As a part of the consideration for the execution of the two agreements described under Item (b) above, Colorado Interstate Gas Company issued to Cities Service Company, 187,500 shares of its no par value common stock.

"The total consideration of $250,000 was paid to A. K. Lee for the contract described in Item (c) above and the natural gas franchises for the towns of Ordway and Sugar City.

"The franchises last mentioned were assigned by Colorado Interstate Gas Company to Arkansas Valley Natural Gas Company for $13,333.33 which represents the adjustment shown on the statement." (Vol. XVII, pp. 2426, 2427.)

On being cross-examined, Lusk said he did not investigate the negotiation of these contracts (Vol. XVII, p. 2427). He stated that his examination of their books disclosed no affiliation between Canadian and Colorado Interstate. Their properties were operated jointly (p. 2428). He only examined the books and the minutes. His exhibit presented the cost of contracts as shown on Colorado Interstate's books in New York. He made no investigation as to the reasonableness of the payment for the contracts. The first two contracts, Items (a) and (b), were paid for in stock only. The third contract, Item (c) was paid for in cash (p. 2429).

As to the contract with Colorado Springs, purchased from Arthur K. Lee, the total amount paid was $275,000, but by agreement with Colorado Springs prior to the purchase of the contract from Lee the city refunded the $25,000 deposit to guarantee Lee's performance, thus making the net payment $250,000. Lee had also made deposits for the same purpose of $15,000 at Ordway; $5,000 at Sugar City, $5,000 at Fountain, and, when Colorado Interstate assigned these franchises to Arkansas Valley, it was successful in recovering two-thirds of $20,000. Fountain refused to surrender $5,000 (p. 2430). These franchises were assigned as a part of the same transaction to Arkansas Valley.

Colorado Interstate began amortizing these amounts paid for the contracts over a period of twenty (20) years (p. 2431). The amount on its books as of December 31, 1939, less amortization from the beginning, was $1,118,061.69.

Q. Mr. Lusk, have you had occasion to and did you investigate the facts and circumstances surrounding each of these; for instance, the $2,000,000 item, (a) gas purchase agreement dated January 3, 1928 with Canadian River Gas Company?

A. I did not investigate any of the circumstances, no, Mr. Lange. These are exactly the amounts recorded on the books of the Colorado Interstate Gas Company.

Q. Is there any other information recorded on the books in connection with each of those items or any of them?

A. Only the extracts of the minutes which are quoted over here in the statement.

Q. Did you know in connection with your accounting work on these books as to the affiliation between the Canadian River Gas Company and the Colorado Interstate Gas Company and Southwestern?

A. Any affiliation between the two?

Q. Yes.

A. Not that I know of.

Q. Well, you know that Canadian River Gas Company and Colorado Interstate have been operating as a single business unit?

A. That is presumed to be the fact; yes, sir.

Q. And that Mr. Christy Payne's statement right at the beginning in the record of this case shows that it was one enterprise, divided into two corporate entities, is true?

A. That made the true.

Q. That was the purpose of it at the very beginning, wasn't it, one project?

A. I think it was; yes, sir.

Q. Have you had occasion to make any study of the corporate relationship existing between the several companies involved on Page 1 as recited there in your exhibit, at the time these various amounts were set up?

A. No, sir, I didn't go any further than the book records and the extract from the minutes.

Q. These are, then, in simple language, the cost of franchises, aren't they?

A. No, they are the recorded book amounts and the cost of contracts. They are listed in the New York books of the Colorado Interstate Gas Company under the terminology or nomenclature of "contracts and franchises."

Q. What investigation, if any, did you make as to the reasonableness of each of these charges?

A. Well, as far as the reasonableness is concerned, I'll say I made no investigation. The amounts shown in the top two lines in the statement, Items 1 and 2, are exactly a recording of the number of shares, 531,250 shares of common, and 10,000 shares of preferred. The preferred at a par value of $100 extended to a value of $1,000,000. The 531,250 shares of common stock extended at $1,000,000 is identical with the amounts paid by the Standard Oil Company (N. J.) for a like number of shares.

Q. What actual cash was paid by the Colorado Interstate Gas Company on this first item, $2,000,000?

A. They didn't pay any.

Q. What actual cash was paid by Colorado Interstate Gas Company on Item (b), 352,941.17?

A. They didn't pay any.

Q. What actual cash was paid by Colorado Interstate Gas Company on Item (c), $236,666.67?

A. Actual cash.

Q. Yes.

A. Yes, sir.

Q. They didn't pay any?

A. Actual cash paid, I said.

Q. That was actual cash paid?

A. Yes, sir.

Q. That is the only one?

A. Yes, sir.

Q. Now, have you got a breakdown of that last item?

A. Well, the amount paid, the total amount paid to the Guaranty Trust Company as escrow agent was $275,000. The amount recovered from the City of Colorado Springs due to a default of A. K. Lee was $25,000, making a net payment of $250,000, and Mr. Lee also had deposits of $15,000 at Ordway, $5,000 at Sugar City, and $5,000 at Fountain, and Colorado Interstate Gas Company when they took over those franchises were successful in recovering two-thirds of the $20,000. Fountain refused to surrender $5,000 of the $20,000.

(Vol. XVII, pp. 2427-2430.)

Colorado Interstate began amortizing these amounts paid for the contracts over a period of twenty (20) years (p. 2431). The amount on its books as of December 31, 1939, less amortization from the beginning, was $1,118,061.69.

The total amount, as thus shown on the books of the company as the cost of franchises and contracts, was removed from the plant account by witness Schutte in his Exhibit 139 (Entries 224 and 225, pp. 39 to 45).

Exhibit 139 and the testimony of witness Schutte has been abstracted above, except with reference to this par-

ticular adjustment. The witness on cross-examination, respecting this adjustment, testified:

Q. Now I would like to direct your attention to Account 303 which is headed "Miscellaneous Intangible Plant" and provides that it shall include the cost of patent rights, licenses, privileges and other intangible property necessary or valuable in the conduct of the utility's gas operations and not specifically chargeable to any other account.

This is under a heading in the gas plant accounts which is called "Intangible plant." I am correct in that?

A. Yes, sir.

Q. Now, gas plant instruction No. 3, which is headed "Gas Plant to be Recorded at Cost" has in Paragraph B an instruction with respect to intangible gas plant?

A. Yes, sir.

Q. And again that is to be stated at cost as set forth in Paragraph A which is the original cost incurred by the person who first devoted the property to gas service?

A. That's right.

Q. Now, what do you understand by "intangible gas plant"?

A. Well, various items could go in intangible gas plant. I should say such items as are properly a part of the capital structure and are not physical plant.

Q. Now, with respect to the contract which Colorado Interstate Gas Company has with Canadian River Gas Company for the purchase of gas and which I think is discussed in your Adjusting Entry 224, now, if that would be an item which all would agree properly should be in the capital account—the plant account—is this account 303 the appropriate place for it?

A. If we agreed that it were a proper capital charge, that would be about the only possible place to put it.

Q. And that is pretty much evidenced by the final clause in Paragraph A under 303 which says:

"• • • not specifically chargeable to any other account"?

A. That is correct.

Q. Now, to be put properly in Item 303, I take it it would have to be some item of intangible property valuable in the conduct of the utility gas operation?

A. And recorded at cost.

Q. Now, in the first place, the contract for the purchase

of gas would satisfy the first part of the agreement, wouldn't it; that is, that would be an item of intangible property?

A. An item of intangible property, but even as such it would be subject to question.

Q. Well, I'm trying to take it up step by step and find just where we get to the barrier.

A. All right, sir.

Q. It certainly is necessary or valuable in the conduct of Colorado Interstate's gas business?

A. That is correct.

Q. And it certainly is not specifically chargeable to any other account.

A. That's correct.

Q. So that what is the objectionable feature of putting whatever the—as you say, the original cost of such a contract might be, in Account 303.

A. Well, this is a rather involved transaction from my viewpoint, and it is my opinion that the contracts entered into for the purchase and sale of gas for which the stocks were issued as a part consideration, would have to be considered as advantageous for all of the participants. It would follow, then, that Southwestern Development Company who controlled the company owning the leases and wells and was desirous of marketing its product would be interested in selling its gas advantageously to itself and, likewise, Cities Service Company who controlled certain outlets for the ultimate sale of gas would be interested in purchasing gas for resale upon a basis advantageous to itself. Standard Oil Company (N. J.) had the necessary finances and was willing to make an investment would be interested in making an investment that would be advantageous to itself. The financing was handled as one enterprise, and from a standpoint of operation, it is likewise handled more or less as one enterprise, even though two companies were organized to carry on this particular business.

As a matter of fact, in the financing, Canadian River Gas Company's bonds are pledged as partial security of Colorado Interstate's bond issue.

Now, in the first place, as I interpreted that particular contract, it seemed to me that those stocks were intended to be given to Canadian River Gas Company, but according to the minutes of Colorado Interstate Gas Company the

stocks were ordered issued in the name of Southwestern Development Company. The Southwestern Development Company, of course, had caused the organization of Canadian River Gas Company and owns and has always owned all of its capital stock, for an initial investment of one dollar. Southwestern Development Company also controlled at the time of this transaction; that is, at the time of the inception of Canadian River Gas Company—owned or controlled the Amarillo Oil Company who in turn owned the leases and wells which are the production system of the enterprise.

Q. Well, that has no direct bearing on this particular—

A. I think it does.

Q. Well, whatever amount had been paid by Canadian River Gas Company to Amarillo Oil Company has no bearing on the transaction here.

A. I still think it does, Mr. Dougherty.

Q. Well, you are going back into something that might have taken place if something else had been done.

A. Well, you asked me for my reason for not wanting to put that in there.

Q. All right, go ahead.

A. Now, the facts of the matter are that Amarillo Oil Company, a wholly-owned subsidiary of Southwestern Development Company, owned leases and wells. Southwestern Development Company had them transferred or sold, if you please, to Canadian River Gas Company for five million dollars, but it did not furnish the money for that. That money came from the general financing program.

In that particular method of handling the item, Southwestern Development Company was paid in full for the initial investment in the leases and wells plus a very substantial profit. In other words, in so far as their production system was concerned, they have already been compensated for that very handsomely.

Q. Well, when you say that you mean they have been compensated with respect to original cost?

A. That's correct.

Q. You are making no statement as to whether they got more than it was worth from a market standpoint?

A. I wouldn't know whether it was worth more or whether it was worth less from a market standpoint.

Q. You do recognize in the oil and gas business that there is such a thing as discovery value? A lot of times money that is put into an oil well can produce handsome results because of the results of drilling the well.

A. That is right.

Q. I mean, that isn't anything new—leaving out utility company operations, that thing happens.

A. As I see it, they ate their cake, but they still have it.

Q. That all depends on value. I appreciate what you are talking about is cost.

A. That's right. Now, in addition to that particular participation, as to the production system, it also received 42½ per cent of the common stock of Colorado Interstate Gas Company and initially it received ten thousand shares of the preferred stock of Colorado Interstate Gas Company. Those stocks were issued to it by Canadian River Gas Company in connection—as I understand the minutes—with the issuance or the execution of this gas sales contract.

Now, when you look at it from that basis, in the first place it would be very difficult to set a value on the intercompany sales contract—sales and purchase contract, and the value that has been set up for it is not necessarily cost because you had a no par value common stock for one thing and you set a value on that, and from an inspection of the minutes of the Board of Directors' meetings, I can't find that they authorized—who authorized the price or the value at which that stock was set up.

Of course, the preferred stock would necessarily be set up at par value because it was a par value stock, but that wouldn't indicate either that the contract was correctly valued.

Q. Well, now, I take it from your general description going back clear to the profit that lies between the five million dollars and the original cost to Amarillo Oil Company and your statement that this stock was then issued for the sale of gas from that same property, you really believe that those representing Southwestern Development Company sort of out-traded those representing the Standard Oil Company?

A. I certainly do. I never have understood how Standard Oil Company representatives would permit themselves to be out-traded, but to me it seemed they were.

Q. You recognized that so far as Colorado Interstate is concerned that the money was put up by the Standard Oil Company?

A. Absolutely.

Q. In Colorado Interstate's securities?

A. That is correct.

Q. Now I want to ask you a few specific questions to see if I can maintain the trading reputation of my predecessors. In the first place, I think you know that this contract for the purchase of gas provides that the price which Colorado Interstate shall pay is in effect based upon out-of-pocket expenditures of Canadian River Gas Company over this period—over this first period of twenty years?

A. You mean the cost of gas?

Q. Yes.

A. I don't interpret the cost of gas the same way that contract does.

Q. Well, now, I didn't say—I don't mean the cost of gas, but the price which Canadian River charges is based upon all of the out-of-pocket expenditures including the amounts necessary to retire their debt and interest on whatever the reduced amount is each year.

A. When you say "expenditures," instead of "expenses," I agree with you, yes, sir.

Q. Well, I am not trying to be technical, but the way it is done is that they charge a composite sum which is made out of all of these expenditures that we have discussed. Now, that transaction also has an option so that if Colorado Interstate wants to take gas after the first twenty years, it can do so and still pay for it on the basis of Canadian River's expenses in producing the gas, drilling the wells and whatever is necessary?

A. That's right.

Q. You recognize that the bonded indebtedness of Canadian River would be paid off in the first twenty years?

A. That is correct.

Q. And that there would no longer be accruing any interest on such funded debt?

A. That is correct.

Q. So that in the second twenty years there would probably be a reduced amount of expenditures by Canadian River Gas Company, certainly at any rate by that portion formerly paid to reduce the bonded indebtedness and interest thereon?

A. That is right.

Q. Now, unless there are a great amount of additional expenditures needed by Canadian River to continue to produce gas, it would be expected, wouldn't it, that after that first 20-year period the amount which Canadian River receives from Colorado Interstate for its gas would be less than during the immediate few years of the end of the first 20-year period?

A. Well, let's see if I can get my idea across on that.

Q. You understand what I am talking about?

A. I think I do, yes, sir. You are right so far as the bonded indebtedness is concerned. I listened to Mr. Rhodes, and I think Mr. Watson, and several other gentlemen here telling what additional facilities were going to be necessary by 1947, which is before the expiration of the first twenty years. The inter-company debt other than bonded debt; that is, the serial notes, are likewise being amortized over this first 20-year period—either, as I recall it, over a 20-year period or the remaining part of the 20-year period.

Q. That's right.

A. In effect, at the end of the 20-year period, then Southwestern Development Company will in effect own all of the Canadian River Gas Company properties for a total initial investment of one dollar.

Q. But still subject to the contract that Colorado Interstate has to call on for gas?

A. And Colorado Interstate, if they require additional facilities, and according to these gentlemen I mentioned, they are going to need a lot of additional facilities, Colorado Interstate would be required to put up additional funds and those funds in turn would again be amortized to a series of company notes.

Q. Now, that, of course, would be done if the volumes of gas available would justify further expenditures after 1948?

A. That is correct.

Q. If it did not, then Colorado Interstate has the option to end its purchase of gas?

A. So I understand.

Q. And upon that occurrence is when Southwestern Development Company, through Canadian River Gas Company, would own the facilities with whatever available gas there was remaining?

A. Yes.

Q. During that period Canadian River would have received no funds with which to pay any dividends during the first twenty years?

A. Possibly it was not intended to work out that way, but they actually, under existing conditions, have accrued surplus.

Q. But no funds with which to pay any dividends out of that surplus?

A. That's right.

Q. And that surplus comes about purely by reason of an income tax base on depletion that is different from the payment that the company—Canadian River—has to make on its debt?

A. I wouldn't say an income tax base, I would say by the application of more correct accounting principles.

Q. Well, it has to do with the matter of dealing with the Internal Revenue Department of the United States.

A. It was brought about that way, yes, sir.

Q. So it is really a bookkeeping surplus rather than dollars in the bank?

A. I wouldn't say it was a bookkeeping surplus. It is right that it is not dollars in the bank. It is a surplus arising because of the difference in applying to the gas billings to Amarillo Oil Company and to Public Service Company of Colorado the expenditures made to liquidate or amortize debt as compared with what the Internal Revenue Department or Bureau advocated as proper allowances for depreciation and depletion on the primary production facilities and Canadian River Gas Company's pipe line.

Q. Did you use the term "Public Service Company" there?

A. I intended there, if I didn't—Public Service Company of Colorado. In other words, the contract here is what I am referring to.

Q. You are referring now to the contract to sell gas to Cities Service Company? I don't understand how—

A. Did I say Cities Service? I intended to say Public Service.

Q. I don't understand how that comes into it.

A. Well, that contract provides for the substitution—not just that way, but this is my interpretation of it—for the substitution of amortization of debt for depletion and depreciation.

Q. I thought that was the contract between Canadian River and Colorado Interstate rather than—

A. That is what I meant. You are right. I beg your pardon. You are correct. I just got a step ahead of myself there.

Q. Well, it is a fact and would be a fact that at the end of the first 20-year period, all of the money which Canadian River collects from Colorado Interstate would be in turn paid out by Canadian River for the things which you would agree are operating expenses, and then for the additional expenditures for the payment back of debt and interest thereon?

A. That is right.

Q. There is no accrual or accumulation of anything like a profit over and above these various expenditures in determining what Canadian River shall receive for this gas?

A. There is an accrual of surplus because of those differences.

Q. Well, I mean other than that.

A. Other than that, I don't think so.

Q. Now, from an accounting standpoint, isn't it appropriate that so far as this type of a contract is concerned, which is not the usual type of gas purchase contract, would its value be determined by the officials of the company who have to deal with it; that is the way it was determined in this instance, of course?

A. I don't know how it was determined. The record doesn't indicate that.

Q. Well, do you follow accounting principals in determining whether it has any value or not, or is that some other set of rules and regulations you have to follow?

A. I don't see how you could put an accounting interpretation on the value of that particular contract.

Q. Well, in the first place the Code provides, does it not, that if cash is issued for property—or, rather, put it this way—starting off with Definition 10, it reads:

"'Cost' means the amount of money actually paid for property or services or the cash value at the time of the transaction of any consideration other than money."

A. That's right.

Q. Now, there was issued as consideration for the execution of this contract a consideration other than money?

A. That's correct.

Q. And I take it that whether that stock has been issued to Canadian River or Southwestern Development Company has no bearing on your adjustment here.

A. Yes, I would say it has. If you were looking at the consolidated picture of the enterprise as a whole and that stock had been issued to Canadian River Gas Company, there would be a wash transaction in making your consolidation between the two, and it wouldn't have any effect.

Likewise, the earnings would be taken care of on that basis.

Q. Well, there is no basis for consolidation of the operations of Canadian River and Colorado Interstate on any accounting principles.

A. Only in so far as we are trying to determine the original cost of the properties necessary for this Denver pipe line project. To that extent—strictly from an accounting standpoint I would say no. The only point there is, of course, the ownership by Colorado Interstate Gas Company and the bonds of Canadian River Gas Company.

Q. Well, that doesn't justify consolidating your property accounts or income accounts, does it?

A. That is correct.

Q. What you are talking about when you say "consolidating them" is for rate case purposes?

A. That is right.

Q. Now, having in mind that on the books of account of this company, when this classification is made and filed with the Commission—and by "this company" I mean Colorado Interstate—that summary has to be made. The stock, whatever its determined value on the books, would be the same irrespective of who owned it.

A. Well, on that common stock which has no par value, you could put almost any stated value you wanted to on that.

Q. Well, whatever the stated value is, however, it is there, irrespective of who the stockholder is?

A. Yes, but what I am trying to say is that that is not an indication of the true value of a contract.

Q. Now, I am still talking about the consideration given for the contract rather than whether or not the contract was worth the consideration, because there is a difference—you recognize that?

A. Yes.

Q. As a matter of fact, you have previously said that what was received for this stock in effect was not worth what Colorado Interstate did give for it.

A. I said that was my idea.

Q. Yes, that's what I mean. I understand that.

Now, in determining the cash value of a consideration other than money, that requires some exercise of judgment, I assume, because the Code does say we have got to put some cash value on the consideration given.

A. That is right.

Q. Now, that same thing is referred to in gas plant instruction 3 under Paragraph D, where it says:

"When the consideration given for property is other than cash the value of such consideration shall be determined on a cash basis."

Now, as I interpret that, Mr. Schutte, that means you determine the cost or the value of the consideration, not on the basis of the value of what you got for the consideration but on the basis of the cash value or the cash basis of the thing you gave up; that is, in determining the appropriative value of the stock which was issued for this contract, and I am now speaking only of the Canadian River contract, we would determine the value of that stock on a cash basis and not on a basis of what the contract is worth.

A. In other words, you determine the value of the stock rather than the value of the contract.

Q. Exactly, and isn't that what you have to do in accordance with this instruction? It says: "When the consideration given for property is other than cash, the value of such consideration shall be determined on a cash basis." Now, doesn't that mean that you find out if you can what the cash basis is or cash value of the stock was?

A. That's right.

Q. Now, that was arrived at—I understand that you are correct, that the Board of Directors did not formally make any declaration of the declared value.

A. I couldn't find any declaration.

Q. Well, I couldn't either. It is quite apparent, how-

ever, isn't it, that the cash basis or the cash value of the stock that was issued to Southwestern Development Company was based on the actual cash paid for a similar quantity of stock by Standard Oil Company?

A. It would appear to be so, yes, sir.

Q. That's just it. There it is.

A. There it is, and you can't get away from it.

Q. So that isn't it a fair assumption to make that the cash basis or the cash value of the stock issued to Southwestern Development Company was two million dollars?

A. I think that could be said.

Q. Because somebody else had paid two million dollars for a similar quantity of stock.

A. That is right.

Q. So that on the basis of the cost to—and again, purely from an accounting standpoint, on the basis of the cost to Colorado Interstate, the cost of this contract was two million dollars, whether it was worth it or not. The actual cost, following the Code provisions, from an accounting standpoint would be two million dollars.

A. I think that is correct.

Q. Now, this is the first time that this contract ever had any value assigned to it. It wasn't on any other books of any other company at any value preceding the entry made by Colorado Interstate.

A. So far as I know there was no prior value assigned to such contract.

Q. Well, Canadian River had never assigned any value to the contract on its books to your knowledge?

A. To my knowledge.

Q. And Southwestern Development Company had never set up any value for this contract on its books?

A. That's right.

Q. So that the first time there was any entry made fixing a value on this contract was when this entry was made on Colorado Interstate's books?

A. That's right.

Q. And that has never been changed, either up or down?

A. That's right.

Q. Well, now, having those facts in mind, isn't it a little inaccurate to say, as you do, that this is a writeup of the plant account?

A. No, I don't think so. I think I am correct in making that interpretation from my ideas of it.

Q. Well, now, let's see where we differ. As I understand, a writeup means that the books of the accounting company at any particular time, containing an assigned value or a figure for some asset which is a greater figure than the same assets were set forth on either the books or at least—first on the books of that same accounting company so that if by some appraisal, for example, if the "X" company in the oil and gas business would have some leases which they later developed and were worth a lot more money, or by a re-appraisal of those leases would increase the book cost, that would be a writeup, wouldn't it?

A. That would be a writeup, yes.

Q. Now, do you consider a writeup where the "X" company sells property to "Y" company at a profit, if the "Y" company sets those assets upon the sale price rather than the cost of the selling company?

A. I didn't quite follow that.

Q. Well, what other kind of writeups do you have in mind?

A. Well, those are the primary kind. However, when securities enter into inter-company transactions, that is the sales, it has been customary to put the property into a pot, so to speak, and issue a bunch of securities against them and then later on evaluate the securities. That would be another type of writeup.

Q. That is, if any company—or the "X" corporation having its property on its books at a certain number of dollars would transfer that property to another affiliated corporation for stock?

A. That's right.

Q. And then later the property would later be put on the books of the purchasing company at a greater amount of dollars than it stood on the books of the selling company?

A. That's right.

Q. But in each instance, Mr. Schutte, don't you have to have some amount to start with so that you have got a difference between the first entry and the second entry?

A. In those instances you do, yes. In this particular instance, which is an entirely different type of item in-

asmuch as this common stock could be valued at almost anything one would wish—in other words, the Board of Directors need not have used the price paid for that stock by Standard Oil Company of New Jersey. They could have used some other value had they wished. Of course, you come back to that cash cost and you have a little different situation.

Q. As a matter of fact, in 1927, without knowing it, they were doing exactly what the Federal Power Commission later on would require them to do?

A. That's right.

Q. Isn't what took place here an evaluation or an appraisal of an asset rather than a writeup of it?

A. I really don't consider that the contract was valued. The stock was valued, but the contract was not. In other words, let me put it this way: You could have put that contract on your books at one dollar and taken the difference between that and the value recorded for the stock and you could have put that in some other account, had they so chosen.

Q. What was done, it is perfectly apparent, isn't it, was that the contract was deemed as having been received for this stock, that this stock was deemed to have a cash basis of two million dollars, and that that amount was assigned as the value of the contract?

A. That is what actually happened, yes.

Q. Now, on those facts alone, then you couldn't tell whether it had been over-valued or under-valued?

A. But I say—

Q. Isn't that so?

A. It appeared to me to be.

Q. As far as those accounting facts and as far as those transactions are concerned, that contract may be worth five million dollars instead of two million dollars. From an accounting standpoint there is nothing, is there, Mr. Schutte, that has taken place which we have discussed that indicates that there was a writeup unless you get into an appraisal on that contract and its value?

A. Well, I considered that the company did make an appraisal of that.

Q. And wasn't that on the basis of the cash value of the stock that had been issued?

A. That appears to be a fact, yes.

Q. So that clearly, so far as the stock is concerned, it had that cash value and that would represent the cost to the company of this contract, whether it paid more or less?

A. Yes, I think I would have to agree with you.

Q. Yes. Now, if, for example, there had been no affiliation of any sort between Southwestern Development Company and the Colorado Interstate Gas Company, the issuance of stock to such an affiliated company in this amount for such a contract would properly be accounted for as it was here, wouldn't it?

A. It would probably be accounted for in the same manner.

Q. And the basis that you are attacking it is really not from an accounting standpoint, but from a rate case standpoint, because of the relationships between these companies?

A. Well, I think in any accounting examination I would handle it the same way whether for a rate case or for some other purpose. I certainly would point it out.

Q. Well, you might note that because of this relationship between Southwestern Development Company and Colorado Interstate Gas Company this transaction had taken place; that is, you might point it out where affiliations exist when you wouldn't have if that—

A. I think I would point it out in any event.

Q. Do you always in accounting examinations or audits point out transactions where stock was issued for property rather than cash?

A. I always have made it a point to do so, yes, sir.

Q. Now, this transaction would essentially have been the same, wouldn't it, if the stock had first been issued to Southwestern Development Company for two million dollars in cash and then if Colorado Interstate had paid Southwestern Development Company a cash amount of two million dollars for the privilege of having this contract executed with Canadian River Gas Company?

A. I beg your pardon. Will you read that?

(The question referred to was read by the reporter as set forth above.)

The Witness: Do you mean for the privilege of negotiating a contract, or do you mean for the contract itself?

By Mr. Dougherty:

Q. Well, for the same thing that was done here, namely, for the contract which was signed by Canadian River to sell gas under its terms.

A. I think it would be essentially the same.

Q. That is, in substance, it is really no different, whether the stock was given directly or whether it took two steps?

A. I think that is correct, yes, sir.

Q. So, don't we finally get down to this, Mr. Schutte, that your questioning of this transaction is based pretty much on your opinion that the intangible value received by Colorado Interstate was not of any substance; that is, there was no value received by Colorado Interstate when it got this contract and that, therefore, the asset has no value?

A. Well, I say, the value, if any, to be placed upon these privileges is referred to the Commission for determination.

Q. And I assume that that is because you do not consider that you are qualified as an expert to place a dollar value on the contract?

A. That is correct.

Q. And the Commission in your opinion should determine whether that contract should be in the plant account at nothing or at one dollar or two million dollars or at some place between those figures?

A. That is the general idea, yes, sir, and that refers to Southwestern Development—I mean the Canadian River Gas Company contract alone.

Q. All of my questions were about that.

A. That's correct.

Q. Now, this, I suppose could properly be termed a writedown if the Commission did put some value less than two million dollars on this contract?

A. You mean if the Commission determined a hundred dollar value as between the two million dollars, that would be a writedown?

Q. Yes.

A. Yes, a writedown as to the value shown on the books.

Q. That is a writedown just the same as the reverse process is a writeup?

A. That is correct.

Q. Now, is there any specific provision in the Code of Accounts that provides for making writedowns on the property of the company, tangible or intangible?

A. Why, yes, I think so, in connection with Account 107, Page 17, under Account No. 107, which is "Gas Plant Adjustments," under Paragraph B.: "The amounts included in this account shall be classified in such manner as to show the nature of each amount included herein and shall be disposed of as the Commission may approve or direct".

Q. It doesn't provide that the accounting company shall make any change? In setting it up, its original cost, in the first instance, whatever change is made, the Commission would have to make it?

A. That's right. In other words, the procedure generally followed, as I understand it, in connection with its original cost is that the company would submit to the Commission its reclassification of accounts. If that were found or determined to be satisfactory, an order would be issued advising the company as to how to proceed with such items as they might have classified as Gas Plant Adjustments.

If that report were not satisfactory, then if the company and the Commission could not get together on it and make it satisfactory, it would be subject to an accounting examination and a report by the staff would be issued. That report would be passed on by the Commission, and if unsatisfactory to the Commission, then I understand a formal hearing would be had and that, of course, would bring out the facts necessary to make whatever adjustments as were determined to be necessary.

Q. Now, Account 107, just as Account 100-5 contemplates that matters that are placed in those accounts have two values—if that is the proper word—at any rate, you should have an original cost and book cost of the accounting company?

A. That is right.

Q. In this case we don't have any such two costs.

A. In this case you would have book costs to the accounting company.

Q. Yes, and wouldn't it be more appropriate if you aren't going to put this two million dollar value of the contract in 303, to put it in 100-6 because all we have here is original cost to the accounting company?

A. No, I don't think so, Mr. Dougherty.

Q. Well, then—

A. Under 100-6, Note B, it says: "No charges other than as provided in Paragraph A above * * *"—which is also 100-6—"* * * shall be made to this account," and I don't think that this particular thing is applicable.

Q. Well, it says there: "There shall be closed to this account the book cost of gas plant as of the effective date hereof."

Now, what this contract would be considered is an intangible item whether it has any value or not, and therefore, if you don't put it in 100-1, wouldn't it properly be in 100-6, because you don't have an original cost and a book cost to the accounting company of original amounts, which I understand is required both by Account 107 and Account 100-5?

A. Well, it is my interpretation that it belongs in Account 107. I interpret Account 100-6 a little different than you do.

Q. Now, if the stock is issued for physical property by a company, do you enter into a questioning of the value, of the physical value it received for it when you make an accounting examination?

A. Yes, sir.

Q. How do you determine what its value is?

A. The value of the stock, or the value of the property—

Q. Property?

A. By going back to the predecessor company.

Q. And you take that, of course, as the original cost?

A. If that is original cost. That may have been acquired from a predecessor, and you would have to go back further in that case.

Q. Well, now, let's close it with a property that had never been devoted to public use, but had just been constructed—I mean—put it this way: Let's assume that part of the pipe line of Colorado Interstate having been constructed by a contractor was purchased by Colorado Interstate from the contractor, or the contractor was paid in

stock instead of dollars, and that is not an uncommon thing in pipe line construction, as a matter of fact.

A. Presumably, in the case of a shoestring operator.

Q. That's right.

A. I think I would go back to that contractor's cost.

Q. Although that contractor who built the line had not yet devoted it to public service?

A. That's right. He wouldn't have devoted it to public service presumably, but you would be trying to get the original cost of that particular property if for no other purpose than to point out the profit accruing to an affiliate because he would be an affiliate in that case if he were given stock.

Q. Now, if he had been paid cash for the property, you would accept that as the original cost to the accounting company, even though the contractor had made quite a profit out of it?

A. I think I would accept that as original cost, but I might question it or I would at least point it out if I thought he had made an *exhorbitant* profit. Let me put it this way: I would compare the cost of that particular section of the line with some other comparable section, if I could, and would give those comparisons in questioning such costs.

Q. Well, then, do you consider it good accounting practice to make writedowns in the property account of companies because they have paid more than what you think they should have paid?

A. No, I wouldn't say that at all.

Q. Isn't that what you would have done?

A. I didn't say that I would have taken it out of the plant account. I said I would have questioned it.

The Trial Examiner: Would you question it, Mr. Schutte, if there was no indication to you that there was a lack of arm's length dealing between the contractor and the company?

The Witness: If there were a lack of arm's length dealing?

The Trial Examiner: Yes.

The Witness: I certainly would have questioned it in that case.

The Trial Examiner: Would you have questioned it in the reverse situation?

The Witness: If it seemed that the costs of that particular section were not comparable with some other section, I wouldn't necessarily remove it from the company's plant account. I don't mean it to that extent, but I would certainly question it and bring it to the Commision's attention, or if it weren't a rate case, to the attention of whateyer responsible party that I was to report to. In other words, I don't think I would be fulfilling my duty if I permitted something which I didn't feel was justified or I thought was out of line, if I didn't point such things out to my superiors.

By Mr. Dougherty:

Q. Well, now, what I am trying to get at is the difference between that process you feel you must do in an ordinary accounting examination and where a question of rate fixing is involved. Would you do it in both instances?

A. I think so.

Q. Well, now, does that mean, then, that when you make an ordinary audit or examination of the accounts of a company that you don't accept the books as representing the factual transactions, if you can follow them through to the vouchers, but you must go into the question of whether the company was out-traded or paid more money that it should in certain instances?

A. No, I wouldn't go so far as to say that. It would depend upon the purpose that the accounting examination were being made for. Most of my accounting examinations prior to my employment by the Federal Power Commission were in connection with the purchase of property, and in that connection it was always my job to point out anything that didn't look one hundred per cent to me, for the guidance of my superiors in making their contemplated purchases.

Q. Well, you were then assisting in the determination of value?

A. In a way, yes.

Q. Yes, and certainly that was your job to do that.

A. That's right.

Q. Now, when the Colorado Interstate Gas Company first classifies its accounts in accordance with the Federal Power Commission Code it is not doing it for the purpose

of determining value, but it is doing it, is it not, to reflect the facts of the expenditures of money on its books?

A. Well, now, we are talking about two entirely different things. I agree with you that from the standpoint of Colorado Interstate Gas Company making its original classification or its classification of original cost, I don't see any objection to their putting this particular thing in Account No. 302 because it will be definitely brought to the attention of the Commission as such and the Commission shouldn't in my opinion be satisfied with the amounts there recorded and the result would be that some adjustment—possibly not adjustment, but the matter would be given the full consideration of the Commission.

Q. And they would investigate it and we would have to satisfy the Commission that the value set up on that contract was proper?

A. Was equitable.

Q. I suppose if we convinced them that it was much less than what its real value was, they wouldn't direct us to write it up, would they?

Mr. Lange: Of course, that has no bearing on this proceeding, Mr. Examiner.

Mr. Dougherty: All right, I'll withdraw it, Mr. Lange.

Q. Now, do you recognize any element of value in a contract that is based on a principle such as this where the price paid for a commodity or service or what-not is computed by including interest, the payment of debt, and interest on the remaining debt rather than merely a contract for so many cents per thousand that might represent some profit in addition to the same item?

A. Do I recognize the value for such contract?

Q. Yes.

A. From an accounting standpoint I think it would be very difficult to determine a value. That doesn't mean that there would be no value, but I wouldn't want to make such a determination.

Q. Let me give you what I think is an analogous situation: Suppose you enter into negotiations with the owner of an office building for a lease for twenty years and this man—the owner of the property and you agreed that you

would work out a lease under the terms of which you would pay the taxes, you would pay the payments required on a mortgage that he had on the building; you would pay interest on the mortgage; you would pay all maintenance, all the operating expenses, and that is all you would pay during the twenty years, year by year, and he said, "I'll make that lease with you if you will pay me a cash down consideration of $100,000," or "X" dollars. That's more appropriate because we aren't talking about definite values.

Now, in the first instance, wouldn't such a lease have some value, namely, that you are having to pay only the things I have mentioned?

A. It might have.

Q. And whether or not that is the lump sum consideration that you might pay him, what that should be would be determined on all of the factors?

A. That's right.

Q. You know, I assume, that in many instances 99-year leases were made and then because of some change in economic conditions or rental values of property or what-not; those leases were sold for a consideration with the purchaser assuming those regular payments as the leases required?

A. That's right.

Q. Now, isn't this transaction, namely, the contract that Colorado Interstate has with Canadian River, one under which a then determined cash value, or value is placed upon the privilege of buying gas and paying for it under the terms set forth in that contract? What I have in mind, Mr. Schutte, is that in principle, isn't that the same thing, leaving out temporarily the question of whether over-value or under-value?

A. There might be some value attached to such a contract.

Q. So that at any rate the parties that were dealing on this basis apparently attached some value to it, as recorded in the books?

A. They attached a value of 42-1/2 per cent of the common stock and ten thousand shares of the preferred stock.

Q. And they measured that value by what someone else had actually paid for the stock?

A. That is what actually happened, yes.

(Vol. XLIII, pp. 5850-5885.)

Other testimony and documentary evidence is collected supra, under title "2. The Agreement between Southwestern Development Company, Cities Service Company and Standard Oil Company (N. J.) to undertake the Project of Constructing the Pipe Line from the Texas Panhandle Field to Denver."

(22) " 3/8/27

20. The Equivalent Original Cost of Colorado Interstate's Portion of the Physical Properties of an Assumed Denver Line Used and Useful for the Transmission of Resale Gas Only, to December 31, 1939, and Estimated Additional Cost, 1940 to 1947, Inclusive.

A description of the Denver Line for resale gas only was given in Exhibit 98, Witness Rhodes, and in this same Exhibit is shown the additional compressor station facilities that would be required up to December 31, 1943, which has already been abstracted *supra* under the heading, "Description of the facilities of an assumed Denver Line used and useful in the transmission of resale gas only." As there shown, the method employed was to reduce the main line from Bivins Station to the Arkansas River from a 22" line to a 20" line, and eliminate all laterals and metering stations not needed for resale gas, and to reduce the number and size of certain river crossings.

Exhibit 134, Witness Lusk (Vol. XXXI, p. 4269), shows the equivalent original cost of such a line. This was accomplished by taking the original cost of the line as actually built, and making adjustments on account of the different facilities required. Deductions on account of reduced size of pipe were made to reflect the lower prices actually paid for materials of the reduced size when the system was constructed. Deductions in the contract cost of laying the lines and in the miscellaneous costs were made in proportion to the reduction in the diameter of the pipe. In the case of river crossings, with reduced number of lines or reduced diameter of pipe, reductions in the original cost were made proportionate to the reduction in the number of lines or the diameter of the pipe. Deductions for laterals and other facilities used solely for direct sale of gas where made (p. 4270) at the original cost of such facilities, as shown by the books.

The costs of the additional compressor station facilities shown in Exhibit 98 to be required for the resale line up to December 31, 1943, were determined largely by the original cost of the initial Ullhart compressor station as completed early in 1940. (p. 4271).

Q. Do you know whether or not Colorado Interstate Gas Company or Cities Service Company owned any stock in that company at that time?

A. I do not.

Q. Do you know whether or not Consolidated Oil Corporation owned any stock in Colorado Fuel & Iron at that time?

Mr. March: I object to that question because Consolidated Oil Corporation was unorganized at that time, as I understand it.

Mr. Campbell: The witness can answer yes or no, can't he?

The Trial Examiner: The objection is overruled.

The Witness: I was about to make the same statement that Mr. March did. I don't know.

(Vol. XXXVII, pp. 5035-5042.)

* * * * *

Q. Now, do you know how much stock Standard Oil (N. J.) owned in Consolidated Oil Corporation, Southwestern Development Company, Canadian River Gas Company, Public Service Company of Colorado or Cities Service Company as of either November 5th, 1927 or June 1st, 1928?

A. I do not.

Q. It has already been testified here that Standard Oil (N. J.) acquired 42½ per cent of the common stock of Colorado Interstate Gas Company as soon as the last named company was formed?

A. Yes, sir.

(Vol. XXXVII, pp. 5043-5044.)

* * * * *

Q. What stock ownership did Standard Oil (N. J.) have in Colorado Interstate Gas Company as of either of the dates November 5, 1927 or June 1, 1928?

A. As a matter of fact, they didn't actually get their stock until after June 5, 1928, but they got 42½ per cent of the common stock of Colorado Interstate Gas Company, and that was 531,250 shares, and they also acquired 10,000 shares or fifty per cent of the six per cent $100 par preferred capital stock of Colorado Interstate Gas Company.

(Vol. XXXVII, p. 5045.)

Q. Do you know how those directors of either of those two companies; namely, Canadian River Gas Company and Colorado Interstate Gas Company, voted on that agreement of—sales agreement of January 3rd, 1928?

A. No, I do not.

Q. Now, Mr. Schutte, about that same time there was a similar sales agreement for sales of gas entered into between Colorado Interstate Gas Company and Public Service Company of Colorado. Do you know who the directors of Public Service Company of Colorado were at that time?

A. W. A. Jones, H. L. Doherty, Clare N. Stannard, E. W. Rollins, Thomas I. Carter.

Q. Do you know how many other directors there might have been on that date?

A. I do not.

Q. You don't know how any of those directors voted on that agreement?

A. No, sir.

Mr. Campbell: That agreement, by the way, is described in Exhibit 7, for the purpose of the record.

The Trial Examiner: It is in the record, Mr. Campbell.

Mr. Campbell: Yes.

Q. Now, about that same time; that is, January 3rd, 1928, a sales agreement was entered into between Colorado Interstate Gas Company and the Colorado Fuel & Iron Corporation for the sale of industrial gas. That is described in Exhibit 9 in this case. Do you know who the directors of Colorado Fuel & Iron were on or about that same time?

A. No, sir.

Q. Do you know whether at that time Standard Oil (N J.) owned any stock in Colorado Fuel & Iron?

A. I don't have that information, no, sir.

Q. Do you know whether or not at that time Southwestern Development Company owned any stock in the Colorado Fuel & Iron?

A. I do not.

Q. Do you know whether or not at that time Canadian River Gas Company at that time owned any stock in Colorado Fuel & Iron?

A. I do not.

The Witness: M-u-s-i-l.

—Thomas I. Carter, Warren W. Foster, Ernest H. Jones, Paul R. Rollins, John M. McMillin, Charles A. Frueauff, E. W. Rollins.

By Mr. Campbell:

Q. Do you know how many other directors there were on that date?

A. I don't know whether there were any other directors, but these have common directorates in other companies.

Q. Very well. Now, do you know how any of those directors that you have named of Southwestern Development Company voted on this agreement of April 5th, 1927?

A. I do not.

Q. Do you know how any of the directors of Cities Service Company that you have named voted on that same agreement?

A. No, sir.

Q. Now, Mr. Schutte, there was introduced in evidence in this case as Exhibit No. 16 a gas sales agreement dated January 3rd, 1928 between Canadian River Gas Company and Colorado Interstate Gas Company. Who were the directors of Canadian River Gas Company on that date?

A. That is also shown in Exhibit 143 at Page 3. Canadian River Gas Company: W. S. Fitzpatrick was President and Director; N. K. Moody, Director; A. R. Jones, Vice President and Director; J. M. Parker, Director; R. W. Gallagher, Director.

Q. How many other directors were there on that date?

A. I couldn't tell you that at the moment because these are the only ones that—

Q. Very well, if you don't know, just say so.

All right, who were the directors of Colorado Interstate Gas Company on that same date?

A. W. S. Fitzpatrick, Chairman of the Board; N. K. Moody was Director commencing June 5th, 1928; A. R. Jones was Vice President and Director; R. W. Gallagher was Vice President and Director; Christy Payne was President and Director; and I show W. A. Jones as Director commencing in September of 1928.

Q. Do you know whether there were any other directors on that date other than those you have named?

A. I do not.

The Witness: Yes, I recall the question but I don't have the information available as to the holdings Standard Oil may have had in Southwestern Development Company or Cities Service Company as of April 5th, 1927.

By Mr. Campbell:

Q. Very well, sir. Now, what stock did Southwestern Development Company own in Standard Oil (N. J.) as of April 5th, 1927?

A. I don't have that information available either.

Q. Very well, sir. Now, what did Cities Service Company own on or about April 5th, 1927 of Standard Oil (N. J.) stock?

A. I don't have that information available.

Q. Who were the directors of the Standard Oil (N. J.) on April 5th, 1927?

A. I don't have all of them, but several of them are shown on Page 3 of Exhibit 143.

Q. Name them, please.

A. Christy Payne. That's the only one I show here as a director.

Q. That is, of Standard Oil (N. J.)?

A. Standard Oil Company, New Jersey paren, yes, sir.

Q. Do you know how many other directors there were of Standard Oil (N. J.) on that date?

A. I don't have that information available just at the moment.

Q. All right, who were the directors of Southwestern Development Company on that date?

A. W. S. Fitzpatrick, H. K. Moody, A. R. Jones, J. M. Parker, Dana Kelsey, Frank E. Jones.

Q. Very well, who were the directors of Cities Service Company on that same date—pardon me, just a minute. Did you name all of the directors of Southwestern Development Company on that date?

A. I don't know that they are all of them. These are the ones that were interested in some of the other companies also.

Q. Very well, now, who are the directors of Cities Service Company as of that date?

A. W. A. Jones, H. L. Doherty, E. E. McWhiney, L. F. Musil—

The Trial Examiner: How do you spell that?

Q. Mr. Schutte, that was introduced in evidence in this case as Exhibit 1, a memorandum of stipulations *come* times referred to as a memorandum agreement between the Standard Oil Company (N. J.) and Southwestern Development Company and Cities Service Company, and that was dated April 5th, 1927. Now, how much stock did Standard Oil (N. J.) own in either Southwestern Development Company or Cities Service Company on that date?

Mr. March: I object to that question because this exhibit, if it please the Examiner, does not purport to show anything other than the dates indicated here. Now, we probably have another exhibit which will show the relationship as of that date. This purports to show the relationship as of December 31, 1939 and the other dates as indicated here. I don't object to asking any questions involving the exhibit here itself.

The Trial Examiner: Mr. Schutte made an investigation of this matter in which these two exhibits are involved and, of course, necessarily would come across certain information. Now, if Commission's counsel is going to put that in in a later exhibit, perhaps it might—

Mr. March: I think it is already in evidence that the Rockefeller interests holdings in Standard Oil were substantial at that date.

Mr. Campbell: If it please the Examiner, Mr. March is off track. I am not inquiring at this time about the so-called Rockefeller interests. In fact, I wouldn't be able to make an intelligent inquiry about that. I haven't yet discovered what he means by the Rockefeller interests. I am talking about Standard Oil (N. J.), Southwestern Development Company and Cities Service Company, as of April 5th, 1927.

Now, if the Examiner please, if the Commission is going to supplement Exhibits 141, 142 and 143 with other exhibits, why, I would like to defer cross examination until those other related exhibits are here.

Mr. March: I have no objection to that examination in spite of the fact that that is going in. It is already in evidence.

The Trial Examiner: Do you recall the question, Mr. Schutte?

A. The pages are not numbered.

Mr. Lange: Is that George MacDonald?

The Witness: I believe that is the name. I will follow him across.

Mr. Campbell: Which page are you on?

The Witness: The next to the last page.

Mr. Lange: It is the third from the last page, Mr. Schutte.

The Witness: That is George MacDonald. You are right, Mr. Lange. It is the second from the last page—the third from the last page.

Mr. Lange: I think, Mr. Schutte, for the sake of certainty about it, why not number every one of these pages in the whole exhibit and then they can be easily referred to?

Mr. Campbell: You mean number the pages?

Mr. Lange: Yes.

Mr. March: You are numbering the pages consecutively?

The Witness: I am numbering the pages consecutively.

Mr. Brock: Starting with the first statement?

The Witness: Starting with the first statement, and not including the index. That gives me seven pages.

Page 3 is the summary of the common officers and directors during the years 1927 and '28, between Canadian River Gas Company, Colorado Interstate Gas Company, Colorado-Wyoming Gas Company, and certain other companies shown on the corporate chart.

Pages 4 and 5 cover the summary of common officers and directors during the year 1931 between Canadian River Gas Company, Colorado Interstate Gas Company, Colorado-Wyoming Gas Company, and certain other companies shown on the corporate chart; and Pages 6 and 7 cover the summary of common officers and directors during the year 1939 between Canadian River Gas Company, Colorado Interstate Gas Company, Colorado-Wyoming Gas Company, and certain other companies shown on the corporate chart.

(Vol. XXXVII, pp. 5029-5034.)

panies as shown on the corporate chart. Now, in here I have endeavored to show the parties holding common directorates in the various companies, and it likewise indicates the offices held, and that is during the years 1927 and 1928.

Q. All of those companies there are shown on the corporate chart?

A. Yes, sir, every one of them except, I believe, the Pueblo Gas & Fuel Company, which I don't think is on the chart because that—

Q. It is not on the chart?

A. No.

Q. All right. That is the only one, isn't it?

A. That is right. That is the only one.

The next page is a summary of the common officers and directors during the year 1931 between Canadian River Gas Company, Colorado Interstate Gas Company, Colorado-Wyoming Gas Company, and certain other companies as shown on the corporate chart, and that also shows Pueblo Gas & Fuel Company which is not on the chart. All the others are.

Q. I notice there you have the Sinclair Consolidated Oil Corporation. That is on one of those schedules there. That is not on the chart. That is some predecessor company, isn't it?

A. As a matter of fact, I don't have any names in there either.

Q. You don't have any names under there at all?

A. No.

Q. On any of your schedules?

A. That is right, and the last two pages covered the summary of the common officers and directors during the year—wait a minute. I will have to go back there.

For the year 1931 I do have one name under Sinclair Consolidated Oil Corporation.

Q. Is that one of the companies that were merged into Consolidated Oil Corporation?

A. Yes, sir.

Q. It is a predecessor of Consolidated Oil Corporation?

A. That is right. That page belongs with the 1931. In other words, these two pages go together.

Q. Which two pages are you referring to?

[Testimony of Witness Schutte.]

Q. Mr. Schutte, I hand you a document entitled "Officers and Directors of Canadian River Gas Company, Officers and Directors of Colorado Interstate Gas Company; Summary of Common Officers and Directors—Years 1927 and 1928; Summary of Common Officers and Directors—Year 1931; Summary of Common Officers and Directors—Year 1939."

I hand you this document and I will ask you what it is and I will ask you to go through it, going through the few schedules in the document and stating just exactly what the nature is of the schedules?

A. This is a schedule of officers and directors of the Canadian River Gas Company and the Colorado Interstate Gas Company and certain other companies for the various years shown by the index, which was prepared under my supervision.

Mr. March: I will ask that the document be marked for identification.

The Trial Examiner: It will be marked for identification as Exhibit No. 143.

(Exhibit 143, Witness Schutte, marked for identification.)

By Mr. March:

Q. I don't think your explanation was quite full enough, Mr. Schutte. Will you go through each of the schedules here, stating exactly what you have in them?

A. On the first page we show the officers and directors of Canadian River Gas Company from the date of organization through December 31st, 1939. It shows the changes in officers and directors and the dates of such changes and the status as of December 31st, 1939.

The second page is a summary of the officers and directors of the Colorado Interstate Gas Company as of the date of organization through December 31st, 1939, and it likewise shows all of the changes and the dates of the changes, and the status on December 31st, 1939.

The next page is a summary of the common officers and directors during the years 1927 and 1928, between Canadian River Gas Company, Colorado Interstate Gas Company, Colorado-Wyoming Gas Company, and certain other com-

The final result, or equivalent original cost of a Denver pipe line for resale gas alone, is shown separately as between the portion thereof owned by Canadian and Colorado Interstate. The equivalent cost of Canadian's portion is shown on Statement F, Part 1, as of December 31, 1939, as $3,933,234; and on Statement 1, Part 2, it is shown year by year, 1940 to 1947 inclusive. For 1940 and 1941 it is $3,966,644; for 1942 it is $4,095,644, and for each of the years 1943 to 1947 inclusive it is $4,307,737. For Colorado Interstate's portion this is shown year by year by accounts from 1928 to 1939 on Statement 2, Part 1, attached to Exhibit 134, and as of December 31, 1939, it is $11,412,163 and in Part 2 of Statement 2 it is shown year by year through 1947. For the years 1940 and 1941 the figure is the same as for 1939, and from 1942 to 1947 inclusive it is $11,657,163.

[Testimony of WILLIAM A. LUSK.]

Q. Now, in this Exhibit 134 you have also made certain calculations with reference to amounts applicable to the construction of a proposed 20-inch line on the items of adjustment to general construction costs applicable to net property additions on Statement 1. Of what item is that a part?

A. That is a part of the same line number in Exhibit 67, adjustment for general construction costs applicable to net property additions in Line 7 of Exhibit 134 and Line 9 in Exhibit 67.

Q. Of what statement?

A. Statement 2—pardon me. Statement 1. It is Line 7. They are corresponding lines.

Q. All of these three exhibits, 67, 133 and 134, have been lined up to match all through because they all deal with property, and the description and the headings are all the same?

A. At least I have tried to have them made that way so there would not be any confusion.

Q. I see. And these adjusted amounts under those same descriptive items constitute a part of the items that were challenged by Commission's counsel in your Exhibit 67?

A. That is right.

(Vol. XLI, pp. 4303-4304.)

Q. Mr. Lusk, this Exhibit 134 is predicated, of course, on a prior assumption made by Mr. Rhodes in Exhibit 98 in so far as the matter of projecting a proposed entire 20-inch line is concerned?

A. That is correct, yes, sir.

Q. And you have assumed at the outset that that is what would be done and then made your calculations accordingly?

A. That is correct, yes, sir.

Q. And, of course, a 20-inch line the entire distance of this line doesn't, in fact, exist at present?

A. No, sir, it does not.

(Vol. XLI, p. 4285.)

---

21. Reproduction Cost New, and Less Depreciation, of Colorado Interstate's Portion of the Denver Line as of December 31, 1938, and as Estimated to June 30, 1940.

The witness Rhodes, who as chief engineer of FB&D, personally checked each item of the design and participated in the construction of the line and in its operation for a time, as the evidence already abstracted shows, gave in his Exhibit 70 his estimate of the cost of reproduction new and less depreciation as of December 31, 1938, of Colorado Interstate's portion of that line (Vol. XII, p. 1710). The line reproduced in Exhibit 70 is as it was originally designed by him and as it now exists. His summary by accounts of the cost to reproduce and less depreciation of the line is set forth as follows on page 32 of Exhibit 70:

Colorado Interstate Gas Company

Reproduction Costs New and Less Depreciation of Denver Pipe Line Properties as of December 31, 1938.

Summary by Accounts.

Acct. F.P.C. No.	Description	Reproduction Cost New	Accumulated Depreciation Per Cent	Accumulated Depreciation Amount	Condition of Properties (Per Cent)	Reproduction Cost New Less Depreciation
	Natural Gas Transmission Plant					
351-1	Land	$ 17,613	0.0		100.0	$ 17,613
351-2	Land Rights (Rights of Way	177,497	0.0		100.0	177,497
352-1	Pumping Station Structures	477,882	14.0	$ 66,903	86.0	410,979
352-2	Measuring and Regulating Station Structures	77,812	13.0	10,116	87.0	67,696
352-3	Other Transmission System Structures	209,536	13.0	27,240	87.0	182,296
353	Mains	7,891,490	5.0	394,574	95.0	7,496,916
354-1	Pumping Station Equipment	1,041,761	12.0	125,011	88.0	916,750
354-2	Measuring and Regulating Station Equipment	81,692	10.0	8,169	90.0	73,523
	Total Transmission Plant	$ 9,975,283		$632,013		$ 9,343,270

General Plant						
372	Office Furniture and Equipment	$ 28,679	20.0	$ 5,736	80.0	$ 22,943
373	Transportation Equipment	63,382	49.0	31,057	51.0	32,325
377	Tools and Work Equipment	34,686	20.0	6,937	80.0	27,749
378	Communication Equipment	152,923	16.0	24,468	84.0	128,455
	Total General Plant	$ 279,670		$ 68,198		211,472
Total of Above		$10,254,953		$700,211		$ 9,554,742
Undistributed Construction Costs		$ 1,895,320		$ 64,706		$ 1,830,614
Working Capital		120,000		.....	100.0	120,000
Total Natural Gas Transmission and General Plant (Exclusive of going concern costs or value)		$12,270,273		$764,917		$11,505,356

Records were made as to the general character, extent and severity of corrosion and of the principal conditions affecting corrosion in that location. The depth of many deepest pits were measured and recorded, generally 30 on each 24-inch section. This number was chosen as necessary to insure a dependable knowledge of the depths of the deepest pits. Special care was exercised in measuring these pits to clean them out thoroughly at the bottom thus insuring a full measure of depth.

"The depreciation suffered by the pipe lines was determined from a consideration of the field inspections above described. The records of the field work were tabulated and summarized. They were subjected to study and analysis both scientific and practical. Consideration was given to the many factors affecting depreciation through corrosion which are described in the succeeding paragraphs.

"Renewals of pipe are most commonly the result of a troublesome succession of leaks caused by corrosion. As leaks occur they are stopped by bolting band clamps around the pipe with a rubber backing over the leaks. Sometimes two or more leaks develop at widely separated dates in the same joint of pipe. The development of leaks first occurs in stretches of lines where for various reasons local conditions are favorable to corrosion. These are called 'hot spots' and range from a few joints to thousands of feet in length. When the leaks occur with troublesome frequency not only is the pipe in the 'hot spot' itself removed but also pipe for an appropriate distance on either side. In practice the worst joints of pipe may have two or more leaks. Stretches of pipe 100 feet long may contain five to ten leaks and other stretches may have no leaks at all. Some pipe is suitable for reuse with a simple cleaning operation, some pipe requires welding up the pits before it can be reused, and other pipe is reduced to junk.

"The progress of corrosion has universally been found to fall off with age. When pipe is first buried it starts to corrode rapidly. As time goes on the intensity of corrosion slows down. Not enough inspections were made of the company's lines nor was there enough range in age to permit a field determination of the extent to which this corrosion slows down. However, the United States Bureau of

Standards has investigated this characteristic of slowing down in corrosion as related to 47 soils scattered throughout the country. There were only 6 soils found in which the depth of pits increased more than 50 per cent through doubling the age and these soils are decidedly unusual in their characteristics. In soils characteristic of Colorado Interstate's territory the increased depth with doubling the age was much less than 50 per cent. Accordingly it was considered in determining the depreciation accumulated in the company's pipe lines that corrosion would slow down to such an extent that doubling the age would result in not more than a 50 per cent increase in the depth of pits.

"It is also the universal experience that the greater the lengths of pipe examined on inspection, the greater will be the average depths of the deepest pits found. A study of the relative depths of the deepest pits in the 24-inch sections was made, from which was determined by scientific analysis the average depths that could be expected in greater lengths of the company's pipe of 10, 20, 40 or 50 feet, as the case may be. This study also determined the number of pits required to be welded in reconditioning.

"Through a correlation and application to the field inspections of the rules of corrosion outlined above by the proper use of engineering methods, it was determined that Colorado Interstate's pipe lines had depreciated 5 per cent.

(Vol. XII, pp. 1726-1730.)

* * * * *

"The wear and tear and other depreciation that had developed in the compressor station equipment was determined from the detailed field inspection of all of the main units and a more general but complete inspection of the many units of auxiliary and miscellaneous equipment. Particular attention was given to the wearing parts such as power and compressor cylinder assemblies, valves and valve gear, and like parts. The condition of each important wearing part was determined and recorded in the field. The field reports were summarized, analyzed and studied and determinations made of the overall physical condition of the equipment in each compressor station. In determining the condition of this equipment, consideration was given to the fact that the greater part of the cost of the equip-

ment is in non-wearing parts which are subject to replacement only as the result of an accident.

"It was not reasonably possible to inspect in detail buried equipment such as foundations, piping, and so forth, and such equipment in each station related directly to each unit, was rated at the average condition of all of the equipment inspected in that station. The yard piping in the station, however, was inspected in the same manner as pipe lines and the condition so found was adjusted to reflect the high percentage of fittings less subject to depreciation than pipe.

"The observed depreciation accumulated in the equipment in the station was determined by a consideration of the factors outlined above. It was found that in the aggregate the Colorado Interstate's compressor station equipment had depreciated 12 per cent.

(Vol. XII, pp. 1730-1731.)

* * * * *

"The depreciation existing in the minor property accounts was in general determined by observation as in the major accounts, in detail appropriate to the importance of the respective accounts.

(Vol. XII, p. 1732.)

"The depreciation determined as having accumulated in Colorado Interstate's property is based on the system as a continuing property without important change except as to extensions. Items of equipment retired in such a property in the natural gas business are commonly replaced in kind and accordingly only a portion of the undistributed construction cost depreciates with the property itself. The replacement of that property involves little or no engineering cost, little interest and little or no cost of financing. Portions of the property, however, that are retired and replaced with property of a different type, which occasionally takes place, involve a repetition of most of the undistributed construction costs. All things considered, one-half of the total amount of undistributed construction costs is appropriately considered as depreciating with the property."

(Vol. XII, p. 1736.)

The general or undistributed construction costs shown in the statement arise principally from (a) the engineering work necessary to design, supervise and inspect the construction, and to test, check and to turn over to the management (p. 1732) an operative plant; (b) preliminary investigation and reports on the project, negotiations with the public authorities and others with respect to permits, taxes and other matters, expenses in connection with receipt and disbursement of funds and accounting therefor, payment of insurance and taxes applicable to the construction period, the assembling and advance training of an operating organization; (c) interest on the money expended for construction of the various parts of the project until they can be put into operation; and (d) cost of assembling the funds required for construction, which represents the difference between the amount of money provided by the investors and the amount of money available to the company to meet its construction requirements. (p. 1733.)

The cost of assembling funds required for the construction of the properties represents the difference between the amount of money paid by the initial investors in the securities when first issued, and the amount available to the new company to meet the requirements of its construction program. This is commonly termed cost of financing. During the years 1935 to 1938 inclusive, more than $9,000,000,000 in securities, involving much refunding of earlier issues, were registered with the Securities and Exchange Commission. The cost of assembling the funds obtained through the sale of these securities, shown by the reports of the Securities and Exchange Commission, amounted to 4.35%. (p. 1734)

The undistributed construction costs applicable to the development of the properties of Colorado Interstate were determined as follows: (p. 1735)

(a) Engineering and supervision during construction	4.5%
(b) Corporate and other company expenses prior to and during construction	4.0%
(c) Interest during construction	5.0%
(d) Cost of financing	4.0%

Interest and cost of financing are applied cumulatively, making the total amount of undistributed costs 18.482%.

One-half of the total amount of undistributed construction cost was considered as depreciating with the property (p. 1736).

All of the elements of cost described related solely to the construction of the physical property, and included no amounts whatever for the negotiation of contracts or for the costs of seasoning the property or of developing an efficient operating organization. The cost of reproducing the property of Colorado Interstate, set forth in the Exhibit, contains no allowance for the cost of establishing the property as a going concern, or what is commonly referred to as going concern value (p. 1737).

Working capital in the amount of $120,000, as determined in this exhibit (p. 1738), will be abstracted under the next title, where there is also included working capital requirements for the future.

The cost of reproduction new, with working capital in the amount of $120,000, was estimated at $12,270,273 and less depreciation at $11,505,356.

Exhibit 68 (Vol. X, p. 1383) in like manner estimated the cost of reproduction new of the transmission system of Canadian River from the intake at Bivins station to a connection with the transmission line of Colorado Interstate at Clayton Junction, in the amount of $4,217,175, including $60,000 as working capital, and reproduction cost new less depreciation in the amount of $3,772,382.

In Exhibit 71, the witness Rhodes brought this estimate of reproduction cost new, and less depreciation, down to June 30, 1940 (Vol. XIV, p. 1980), at which date the reproduction cost new was estimated at $12,328,153 and, less depreciation, at $11,551,077 (Statement 1), and for the transmission system of Canadian River, it was $4,378,603 as the cost of reproduction new, and $3,919,407 for reproduction cost new less depreciation.

Further Testimony of the Company's Witness Rhodes.

Q. What is the date of this exhibit, Mr. Rhodes?

A. As of December 31, 1938.

Q. When did you start accumulating the information contained in the exhibit?

A. In 1938.

Q. What time in 1938?

A. I beg your pardon—in the spring of 1939, we started accumulating the data.

Q. In the spring of 1939 you started accumulating the data?

A. That's right.

Q. What month?

A. I don't recall.

Q. Do you know approximately what month?

A. I think the spring is quite near enough. The work started in the early spring in a small way and it was most active in the summer. The field work was completed in the fall.

Q. How many men were working under your supervision in accumulating this information?

A. Oh, various numbers from two or three to as many as fifteen or twenty.

Q. Were they all employes of Ford, Bacon & Davis, Inc.?

A. All except the regular company employes that I mentioned in my testimony, that—where we had company men to take off certain data from the records because of their familiarity, which was important.

Q. What part of this report did they get the fundamental data for?

A. They took off from the records as to accounts of materials on the books; for instance, for the purpose of making—or getting our book figures and as to detail of materials as shown by the books, that was taken off and furnished to us. The company's men dug out their records as to maps and furnished them to us.

Q. Just what type of records did they have to consult?

A. We consulted all of the records of the company as to inventories that we could find, engineering department records during the inspection period, maps, surveys, the accounting department records, purchase orders of materials, everything that we could find that related to the inventory of the property.

Q. You would say none of this reproduction costs new has anything to do with present reproduction costs new on the property?

A. This reproduction costs new is of the inventory as it existed at December 31, 1938. I have already testified that the prices at which that inventory was priced prevailed through the year 1939, and incidentally they also prevailed up to the middle of 1940.

Q. How do you know?

A. Because I have made an investigation.

Q. You have made an investigation to ascertain that prices recorded in this inventory here are the prices which have prevailed straight through 1939 and up through the middle of 1940?

A. Substantially uniform price level as affecting this inventory.

Q. What have you got to support that?

A. Well, we made inquiries from manufacturers of the principal materials. We have been keeping up-to-date reproduction costs new on other similar properties and they all indicate that there is no—up to the middle of 1940 there was no appreciable change in the price level as affecting this type of construction.

Q. What other property are you keeping a reproduction costs new figure on?

A. Well, we have recently had occasion to determine prices as of the middle of 1940 for—reproduction costs determination of the property of the East Ohio Gas Company which is three or four times the extent of this property.

(Vol. XI, pp. 1437-1440.)

* * * * *

Q. What large purchaser of pipe did you consult?

A. I consulted—

Q. That you consulted personally in 1940. I am asking a question about 1940.

A. I am in touch by telephone quite frequently with a Mr. Kelly, who has charge of pipe purchases for Standard Oil Company of New Jersey, and I ascertained from him the trend in pipe prices, as well as the trend that we find from purchases we sometimes make ourselves. I asked him what he had been paying for pipe through this period.

Q. Through which period?

A. Well, I asked him first about through the year 1938, through the middle of 1939, and later have extended it to 1940. I found that he and the purchasing agents of other affiliates of Standard Oil Company of New Jersey are paying for some couple of hundred thousand tons of pipe a year, which is far more pipe than entered into this project, paying the prices I used in pricing my inventory. They are not in their purchases of pipe per year going into this project getting the ten per cent I was allowed in a discount. Furthermore, I have had furnished me for the purpose of a check a list of purchases for a part of that period by certain of the subsidiaries and I find that his statements are correct. Those papers were loaned to me and have been returned.

Q. I want you to produce those papers in the hearing-room because I want to ascertain just exactly what the situation really was.

A. I have stated what the situation really was. I do not have the papers and the papers are not in my possession.

Mr. Dougherty: Mr. March, I think I can get them.

(Vol. XI, pp. 1443-1444.)

* * * * *

Q. Of course, before you negotiate with the manufacturer of the pipe, naturally you have to have a contract, don't you, when you purchase the pipe?

A. When you negotiate the price of pipe you usually issue a purchase order.

Q. Don't you have a contract?

A. Usually not.

Q. You don't know whether there were any contracts involved in this pipe purchased by Standard Oil Company or not, do you?

A. I didn't inquire as to the exact machinery. I saw purchase orders they had issued. I myself have purchased pipe on a purchase order without a contract.

Q. You didn't do that in the case of the Canadian River, did you?

A. No.

Q. You didn't purchase any pipe for Canadian River, did you?

A. No, but I purchased more pipe than was required in this property.

Q. For Standard Oil Company?

A. No.

Q. Who for?

A. (Pause.)

Q. Who for, I said?

A. I think that is an affair of another client that I don't think should be dragged into this situation.

Mr. March: It isn't an affair of another client. It is an affair of this procedure. I want to know if this witness purchased this pipe for Standard Oil Company or any subsidiary of it, and I think I am entitled to know that. There seems to be a close cooperation between the Standard Oil Company and Ford, Bacon & Davis, Inc., and I want to explore the angle. They even consult Standard Oil Company before they can make a reproduction cost new estimate. They have to find out how much to put in the estimate. That is the reason I want to know.

The Trial Examiner: Please answer the question, Mr. Rhodes.

The Witness: I will state this: The purchase to which I referred was made by Ford, Bacon & Davis, Inc. for the company which was not a subsidiary of Standard Oil Company and nobody in Standard Oil Company at the time of the purchases had anything whatsoever to do with that company.

Mr. March: What is the name of the company?

The Witness: You have also made some statements—

Mr. March: I object to the witness talking that way. Let him answer the question.

The Witness: You have accused me of doing something which I haven't done.

The Trial Examiner: Just a moment, Mr. Rhodes.

Mr. March: I request that that be stricken from the record. The answer is not responsive to the question, Mr. Examiner.

The Trial Examiner: I think Mr. Rhodes answered your question.

Mr. March: He hasn't named the company and I want to check to see if it is a subsidiary of Standard Oil Company.

The Trial Examiner: I don't believe that it is necessary or essential for the record, Mr. March.

Mr. March: I take an exception to the Examiner's ruling.

The Trial Examiner: Very well.

By Mr. March:

Q. What other company have you purchased large amounts of pipe for?

A. That is the only one company in which I myself have participated in purchasing such large amounts of pipe.

Q. In your experience in purchasing pipe, has it been limited to that transaction?

A. I have been acquainted with the purchasers of pipe of course in these hundreds of millions of dollars or more of projects in which we have participated in as engineers or constructors, and at the time the purchases were made I knew the price that was paid.

Q. Do you know the price paid for the pipe in the Canadian River project?

A. I don't recall the price.

Q. You don't know, do you?

A. I knew at the time.

Q. You don't know now?

A. I haven't looked it up recently.

Q. Did you make any estimate as to the cost of the pipe before the Canadian River project was laid down?

A. The price at which pipe was to be sold was provided to me at the time the earlier estimates were made.

Q. Did you make an estimate? Did Ford, Bacon & Davis make an estimate of the cost of pipe to go into this Canadian River project prior to the time that the pipe went into the property and the pipe was purchased?

A. We were informed as to what the pipe would cost.

Q. Did you make an estimate?

A. One doesn't make an estimate of what the price will be.

Q. You didn't make an estimate?

A. Of what?

Q. Of the cost of pipe to go into this project.

A. The cost of pipe to go into this project was placed in there as furnished to us as to what the price would be.

Mr. March: Mr. Examiner, I request that the answer be stricken as not responsive to my question.

The Trial Examiner: Mr. Rhodes, just state whether or not you made an estimate.

The Witness: Of course I didn't make an estimate of the cost of pipe in that project.

By Mr. March:

Q. Ford, Bacon & Davis made an estimate?

A. No.

Q. Have you ever seen this sheet of paper?

A. I don't know whether I have or not. It looks rather familiar but it has nothing to do with the cost of pipe.

Q. I hand you this sheet of paper and ask you what it is. Do you know?

A. This is a piece of paper with the heading at the top entitled "Bids on Pipe Line Construction, Amarillo-Denver Line, Project No. 1." The list gives the names of five contractors, giving their bid prices on 86.33 miles of 22-inch pipe, and there is a note at the bottom saying, "Bids were given exclusive of paint. Williams Brothers bid for hot application was approximately 17½ cents and only a few cents for cold application. Other contractors' bids exclusive of Booth and Flynn were in the neighborhood of 15 and 17½ cents. Estimated cost was 70 cents a foot."

Q. Who made that estimated cost?

A. I think Mr. Hill did.

Q. Mr. Hill of Ford, Bacon & Davis, Inc.?

A. I think he did.

Q. How much did that pipe cost according to that tabulation?

A. This doesn't state how much the pipe cost. This is a bid for the installation of the pipe. Mr. Hill in estimating the project estimated 70 cents a foot for laying the pipe. He got the bid ranging from 52 cents a foot to 82 cents a foot and the bid was given to the 52-cents a foot bidder.

Q. In other words, Ford, Bacon & Davis estimated it would cost 70 cents per foot to construct this portion of the 22-inch line of the Canadian River Gas Company, whereas, as a matter of fact, it only cost 52 cents a foot, is that right?

A. 52 cents plus some extras.

Q. What were those extras?

A. I don't know.

The Trial Examiner: Mr. Rhodes, did you say the 70 cents a foot covered the cost of laying the line?

The Witness: Why, the 70-cent per foot estimate which I say—I saw Mr. Hill's initials were on this paper—was made for the purpose of informing the backers of this project how much money they were going to have to put up. In getting bids from the several contractors he got a bid of 52 cents per foot and I know in all the contracts that we have let there are provisions for extras such as rock-weighting the line and any of these unusual features that are not in the nature of ordinary construction.

(Vol. XI, pp. 1448-1454.)

* * * * *

The Trial Examiner: Pardon me, Mr. March. Just so that I might be clear: Now, this installation of pipe, what does that include? the ditching, the laying—

The Witness: It takes the pipe from the cars from the railroad siding where it is furnished, hauls it out to the line, strings it along the line, ditches the line, puts the pipe in the ditch, and back-fills it. The 60 cents is exclusive of certain welding work which amounts to little on this particular line. That is shown near—about a third of the way from the bottom of the page, it's being $1,150, for instance, and it is also exclusive of what is shown on the following page of certain pipe coating on that line at other prices for the application of the coating, but the 60 cents a foot is what we think of generally as the laying or installation of the pipe.

The Trial Examiner: It would apply to the bare line as well as to the coated line?

The Witness: Yes, and then you pay extra for any portion that is coated, depending upon the kind of coating.

The Trial Examiner: Yes.

The Witness: You pay extra for incidental welded joints and miscellaneous items of that kind that it is not possible to definitely foresee when you ask for bids.

(Vol. XI, pp. 1461-1462.)

* * * * *

You gave no consideration whatsoever in your estimate of the reproduction costs new of installation of pipe and

the original cost—you gave no consideration to the original cost in that reproduction costs new estimate, what it really did cost the company when they put the pipe down?

A. Only to this extent: We knew—were informed by the contractor who built this particular section of line that he did a little better than come out even. When it came to the rest of the Denver line, we know that the contractor made a satisfactory profit, but our figures weren't based on the original cost other than to that extent. They were based on our basic experience covering some thousands of miles of line whereby we have determined and have set down as the concensus of opinion of our men who were experienced in that work the performance of men and equipment in the several different classes of country into which we divided that through which the line is to be built. They are based not on any one line but on the experience covering a great many lines.

It is of interest, of course, to know how the results in any one particular project such as this compare with the prices actually paid ten or twelve years ago and that comparison has been made by me.

(Vol. XI, pp. 1464-1465.)

* * * * * *

Q. Why does it just so happen that in this particular case we are referring to here that the actual cost of construction of putting that pipe in the ground was something like 52 cents and you originally estimated it to be 70 cents and now you come along and say that the reproduction cost new would be 60 cents; is that an accident?

A. Yes.

Q. How many accidents like that have you got in here?

A. Well, any relation that might exist between the reconnaissance estimates and between the contract prices and between the prices I now estimate is an accident because I have estimated the cost of doing the work under the conditions which now exist, not the conditions which then existed.

Q. Do you mean to tell me that when Ford, Bacon & Davis, Inc. made the original estimate of the cost of installation of this pipe they didn't make a thorough survey, have thorough knowledge of the country over which this pipe would have to be put in the ground—they didn't make a

thorough analysis of the roads and vicinities of the road transportation facilities; they didn't take these other things into consideration that you now are taking into consideration?

A. No, but with qualifications.

Q. What are the qualifications?

A. Because the qualifications of these—in making reconnaissance surveys upon which people backing a project determine whether or not to put up the money, they do not require and are unwilling to pay for the cost of going into that detail. In this particular case the difference between the reconnaissance estimate and the contract price of 18 cents a foot was something of the order of three per cent of the cost per foot of the whole pipe line in place, and promoters of projects aren't willing to spend the money to go into the details to ascertain such minor differences.

Q. You call 20 per cent over estimate of costs originally a minor over-shooting of the proposition?

A. The people who put up the money speak of differences in terms of total cost, not in terms of the small part that might be under consideration.

Q. Now, who were the people who put up the money and did they refuse to make available to you enough compensation to go fairly into this project before they agreed to undertake the construction of the same?

A. Well, in answer to the first question it is a matter of record, I believe, that the Standard Oil Company furnished the money. In the second place, long experience in the engineering business leads us to the knowledge that people are unwilling to put up the money for detailed surveys in advance and we never asked to do it. It is generally acknowledged to be a waste of money to do it.

(Vol. XI, pp. 1466-1468.)

* * * * *

Q. Were these men working on anything else during this period?

A. During this period men have been working for me on this reproduction cost study of this Denver line project on economic analyses of the project and Mr. Lusk testified here as to the work he had done. He was one of the men who has worked on other features for me. I haven't the slightest idea what the average number of men was. It's

a thing that is meaningless to me. I haven't paid any attention to it.

Q. I didn't ask that question to you last. Here is the question I asked you, if you recall. I asked you: Were these men working on any other projects other than this reproduction costs new study here during this period?

A. You mean on work in connection with other properties?

Q. Other properties.

A. Some of the men were, yes.

Q. Were you working on any other reproduction costs, new estimates for other properties during this period?

A. Yes.

Q. And some of these men working under your supervision were too?

A. Some of the men who worked on certain phases of this work worked on other projects.

Q. Now, what were these other projects you worked on during—and these other men were working on—during the period they worked on this particular exhibit here, or the entire reproduction costs new in this exhibit which you have prepared in this proceedings?

A. Well, without being too exact as to date, which I cannot be because my memory isn't sufficiently accurate, during the period that this work was going on I have had made under my direction reproduction cost studies of Hope Natural Gas Company, of New York State Natural Gas Corporation, as well as this particular group of properties, on all three of which properties certain men carried out the same nature of work, for instance the determination of the construction conditions affecting the cost of laying pipe lines, putting the pipe in the ground, were carried out by the same group of men on all three of these properties and the estimates were made in an identical manner. The estimates of cost of reproducing compressor stations were in charge of the same men on the Hope property and on this property in as far as they relate to the performance of men and equipment. The work of turning those performances into dollars was carried out by different men. The inspection of the property for its physical condition was made by the same group of men in all three instances except as to the

compressor station condition of New York State Natural Gas Company which was not inspected by the men who inspected this property. I know I would say in general that the rest of the men working on this particular reproduction costs estimate were working on this alone except for incidental men who have been called in from time to time to help out.

(Vol. XI, pp. 1477-1479.)

* * * * *

Q. I believe that here you have assumed—you stated in your testimony that you are assuming that a newly independent and organized—a newly organized independent company would come in here and reproduce this project, you have assumed that?

A. Yes, that is the fundamental basis of the reproduction cost.

Q. You didn't assume that this project would be reproduced by the same parties that put the project in?

A. No, I assumed a separate independent corporation in order that this reproduction cost estimate would be equivalent to other estimates made where the people who developed the project were independent of these large operators.

Q. Then why did you consult Standard Oil Company as to the price of this pipe?

A. Because there has been so much question as to what the price of pipe is—as to what is the price of pipe I wanted to get the advice of a large purchaser to supplement my own information.

Q. And a company which was largely interested financially in the company in which you were making the reproduction cost estimate new for?

A. That was a minor incident. If there had been any other large purchaser of pipe I would have consulted them but I did not personally know of any other purchasing agents and I was able to get in touch with Mr. Kelly.

Q. There were no letters written between you and Mr. Kelly relative to this matter?

A. No, Mr. Kelly did not write me about it.

Q. Upon what basis do you assume that this project, if it were reproduced, would be reproduced for some independent and newly organized company?

A. Why, as a basis for setting up a reproduction cost

new comparable with other reproduction costs new that we made from time to time it is a standard method with us because these large operators always contribute something in the development of the project which never gets reflected on their books.

Q. In other words, not everybody can have John D. Rockefeller, Jr., put up all of the money like he did in this project?

Mr. Dougherty: I object to that question because that isn't the testimony of the witness.

The Trial Examiner: Objection sustained.

By Mr. March:

Q. Do you know who put up the money for the financing of this project?

A. Yes, the Standard Oil Company.

Q. Do you know how much in bonds John D. Rockefeller personally put up?

A. No, but the money was put up in the form of cash furnished to us, and the financing of the company was arranged for after it had been built. That is one of the details that are not possible with independent corporations. They have to go into the market for their money.

Q. In other words, an independent corporation would have a great deal harder time getting the money—

A. That is right.

Q. —than these parties?

A. That is correct.

Q. Why?

A. Well, they have no credit to start with, whereas I am sure Standard Oil Company have plenty of credit.

Q. It would have to first establish its credit?

A. An independent group would first have to establish the merits of the project to the satisfaction of the public.

Q. To the public.

A. Yes, to the buyers of the security; whereas, a project carried out by skilled operators can be done satisfactorily as to the merits of the project without quite so much difficulty. They are able to judge for themselves and after the merits of the project have been established the bankers have to sell the securities before there is any money to start the

building. For a great many projects of magnitude comparable with this it has been necessary to get the money from the public before the work has been started, at least in considerable part.

Q. You know, though, that if this project was reproduced it would be reproduced by these same parties?

A. No.

Q. You don't think it would be?

A. I don't know.

Q. Do you think it would be practical to reproduce this project in toto?

A. Of course nobody is going to reproduce something that exists unless it is destroyed in total. I am merely determining what it would cost to reproduce it if it were to be reproduced.

Q. You don't know whether it would be economically feasible to reproduce it or not if it were destroyed, assuming that?

A. I haven't investigated that phase of the situation.

Q. Therefore, you don't know whether these same parties would want to undertake the reproduction of these properties?

A. I have already said that I didn't know who would reproduce it.

(Vol. XI, pp. 1481-1485.)

* * * * *

Q. Now we come next to the question of accumulated depreciation. I note on Page 35 of your summary opposite "main" that you state the percentage of depreciation of the pipe line has been approximately seven per cent.

A. Yes.

Q. And I believe that is on an observed depreciation basis?

A. That is right.

Q. Will you define observed depreciation?

A. The per cent of pipe that has progressed towards complete depreciation physically.

Q. As observed—

A. The observed extent to which the pipe has progressed towards complete physical depreciation.

Q. You did not in any case here use straight line depreciation, did you?

A. I have used just what I stated, that this is the extent or percentage by which the pipe has progressed towards complete depreciation.

Q. As observed?

A. As observed.

Q. I am asking you a question as of whether or not you used this report at all in straight line depreciation, employed that method?

A. The words "straight line depreciation" have been so badly misused and has so many different meanings I am afraid I cannot answer your question until you are more definite as to what you mean.

Q. I will ask you to define straight line depreciation as known in the accounting and engineering world.

A. Straight line depreciation as it is frequently used is the application of an assumed life to a piece of property and the assumption that the property depreciates uniformly year by year and is completely depreciated at the end of that assumed life. That straight line depreciation I have not used.

Q. What straight line depreciation have you used?

A. I have found that this pipe has progressed seven per cent toward complete depreciation and I have represented the money as seven per cent of the total cost. It is straight line to that extent.

Q. Based, of course, solely upon observation?

A. Based upon observation.

Q. In other words, you didn't adhere so far as your calculations were concerned as to what date the pipe went into the line?

A. No, I was concerned only with that in the same way that you would be if you knew that seven per cent of the gasoline in the tank of your automobile was gone.

Q. How long would it take this pipe line to go out, to be completely depreciated?

A. More than a hundred years; that is, on the average. The pipe line itself can be maintained as a pipe line just as long as the company cares to do so.

Q. Yes, but assuming the pipe is in the ground and will last for over a hundred years?

A. The pipe line will, but some of the pipe will be replaced before a hundred years.

Q. A small portion of the pipe?

A. I don't know how much, but it is a fair portion of the pipe.

Q. In other words, this pipe line can be operated very well with minor repairs for a period of a hundred years from this date?

A. That depends upon what you mean by "minor." I have made no attempt to determine how much replacement of the individual joints of pipe would be required in the hundred years. I have merely ascertained that on the average the joints of pipe in the line have progressed seven per cent towards complete depreciation of the joints.

Q. I believe you stated you went along the line and, every once in a while you would dig a hole over the pipe, scraping away about three feet of dirt, so that you could get all the way down to the pipe and then you made an examination of that particular portion of the line. You did that right on down the line, did you not?

A. Your statement of what I said is not quite correct. I stated that at practical uniform intervals of about two-thirds of a mile the line was exposed and inspected. That is an adequate sample for the purpose of determining the extent to which the pipe has depreciated or deteriorated.

Q. If I bring several pieces of pipe in here Monday and put them on the table here, do you think you would be competent to tell me how much those pieces of pipe have depreciated?

A. That can't be done.

Q. You can't do that?

A. No. You can take and examine a whole line and determine the average result as affecting the whole line, but I wouldn't attempt to do it with respect to any one piece of pipe or any several pieces of pipe that you might bring in here.

(Vol. XI, pp. 1532-1535.)

* * * * * *

Q. When you take averages you have component parts of averages. When that man, whoever looked up that pipe, looked at it he had to give some sort of estimate from his observation as to just how nearly depreciated that particular piece of pipe was when he looked down in one of these holes, didn't he?

A. No.

Q. What was the situation?

A. He just recorded to me the extent and character of the corrosion he found, as well as the various factors that affect corrosion, such as the character of dryness and moisture of soil and so forth, but the principal thing which he did and recorded, and which controls the pipe, is the depths of the 10 to 20 deepest pits he finds by a proper study and comparison of those depths and their relationships one to another and the well known fact that corrosion slows down with time and to determine the most that that line could be considered to depreciate.

Q. He wrote a report upon every one of those little holes he examined, what the condition was of the pipe at every opening? In other words, it was a report of the erosion, exactly the state of the condition of the pipe, is that correct?

A. He took two feet of pipe, measured 20 or 30 or 40 of the depths—of the depth pits he would find in that pipe and reported their depths.

Q. He didn't report the condition of the pipe, is that right?

A. Other than the depth of the pits and the general appearance of the corrosion, and where it was worse—where the worst corrosion was located, and things of that nature, but he attempted to put no percentage condition or anything of the kind on the pipe as he saw it.

Q. You wouldn't expect one of your men to be able to look at a piece of pipe and observe how much it had depreciated, would you, what percentage?

A. It couldn't be done without measurements.

Q. That was not done in this case? Your men didn't actually take the measurements?

A. Yes, they took the measurements.

Q. They didn't measure the corrosion on the pipe?

A. They measured the extent of corrosion on the pipe and expressed it in fractions of an inch.

Q. What instruments did they use?

A. Depth gauges.

Q. How does this depth gauge work? Let's get the process that is followed. Do they first clear away a portion of the pipe.

A. Yes. I explained that the hole was dug large enough so they could get under the pipe, the sides of the pipe, and that it was cleared for about three feet, and the central two feet of it was completely and thoroughly examined.

Q. And how does—how do they apply the instrument you speak of, the depth gauge to the pipe?

A. The depth gauge to the pipe is an instrument that has a little needle on it, or the equivalent of a needle, that can be moved up and down with respect to the edge of the instrument, and there is a scale on it whereby when you put the edge of the instrument flat on the pipe with the needle pointing down and touching the bottom of the hole that scale will read the depth of the hole in thousandths of an inch or hundredths of an inch or whatever you want to use.

Q. Just the depth of the hole?

A. That's all.

Q. I am interested to know how you determine how much corrosion has taken place on the pipe.

A. The corrosion on the pipe as measured by the depth of the pits is the only thing in which we are interested because that is the thing which results finally in the pipe being retired and another piece being put in its place.

Q. You mean the depth of the hole?

A. That's right. Ultimately leaks develop and when the leaks develop because these pits have gone through the pipe, when they occur with troublesome frequency in any one location, then the men go in there and replace a section of the line.

Q. Did you have any instruments to measure the depths of the pits in the pipe?

A. Yes, that's the depth gauge which I have just described.

Q. Well, I am confused here as to your measurement of the hole, the depth of the hole and the measurement of the corrosion, or the depth of the holes on the pipe.

A. Well, they are the same thing.

Mr. Dougherty: When you say "the depth of the hole" you mean the hole that is dug in the ground?

Mr. March: I merely meant the hole in the pipe. I thought the way he was describing it he was measuring the depth of the hole in the ground, but I meant the depth of the hole in the pipe.

Mr. Dougherty: I think that's what he has been talking about.

By Mr. March:

Q. So this depth measure, measured the depth of the hole in the pipe?

A. That's right.

Q. Now let's see one of your reports. While he is getting that out, these reports are all that you had before you when you made your report—I mean when you made your estimate of seven per cent?

A. No, these reports had been studied and summarized and analyzed and certain determinations made from those, from this analysis to determine the extent to which this corrosion had progressed toward the point when leaks would occur in the pipe, and I had that before me when I reached the conclusion that seven percent fairly represented the depreciation in that pipe line.

Q. But would you feel competent—are you a chemist?

A. No, but I have studied chemistry.

Q. Do you have a chemist expert on your staff who helps you make these analyses of the condition of this pipe?

A. Chemistry has nothing to do with it. It is merely an analysis of the phenomena of corrosion that results from chemical action.

Q. And you feel confident by mere description of the condition of the pipe to—samples of conditions of the pipe to tell just exactly what extent the depreciation has been?

A. The inspections are made by men who carry out their instructions I give them?

Q. Do you feel competent to do that?

A. Yes, I have been studying corrosion of pipe lines intimately for the last ten years. I have cooperated with the Bureau of Standards in the study of corrosion phenomena and participated also with my associates in their corrosion conferences at the Bureau of Standards.

Q. Have you any reports you have written or articles you have written or reports that you have helped to write upon the phenomena of corrosion of pipe lines?

A. Yes, the Bureau of Standards in their files have reports of mine that were submitted to them in confidence.

Q. In confidence?

A. Yes.

Q. You wouldn't want to let us look at those reports, would you?

A. I have none of them with me and I'm sure they would be quite meaningless to a layman because they are highly mathematical.

Q. They certainly would make it possible for us to determine how much you know about corrosion.

A. I don't think they have any place in this proceeding. I have no copies and the nature of the work and the constructive work I have done with the Bureau of Standards is such that I don't think that they should be spread on the records of this meeting. I can show your engineers how it is done but I don't believe it would be understandable to a layman.

Q. I want you to show the Examiner on this record how it is done and have it on the record.

Let's see here, I notice here that you have "Pipe Inspection Report" here—"Main Line, Class: Transmission, Block No. 1, Section 1, County and State of Texas, Detail of Location, W. M. Green."

Now, would you go through that and describe just exactly the type of information that is contained on that report and by whom it was prepared?

The Trial Examiner: Is this a report now on the one hole, Mr. Rhodes?

The Witness: Yes. This is a field report made by one of our men, Mr. S. B. Brown; and it is inspection No. T-61, the location of which appears on a map which is in the working papers, and it gives the location of it in the usual coordinates of Texas as to the block and section and so forth, and it also shows it is located at Station 229 33, and it is also shown to be 1493 feet southeast of Drip No. 22. It can be located on a map. This shows that this inspector found the *peipe* was a 22-inch pipe. He measured it. He has a circumferential tape to measure the diameter so as not to guess. He found that it was steel pipe and lap-weld, that there was no joints or fittings uncovered in the hole. He showed that the topography was level. It was 100 per cent tilled ground. He showed where the test pit was the ground was level and he marked the contour "indefi-

nite." By that he means there was no particular slope around there anywhere. He said there was no drainage along the trench but the pipe had a slight slope of about a half a degree. There was a 28-inch cover over the pipe.

Then as to the surface of the line he said it was in a side of a property line in a field, that there was no pavement, of course, being in the field, that the general type of soil was loam and sand, or sandy loam as we interpret it; that it would be easy digging, and there was no pipe coating.

Now, that was general data which he recorded.

Now, then, he recorded as to general corrosion: First, as to the extent of the corrosion, it was slight and scattered over the surface of the pipe. Again as to location we have them record where it is heaviest or least and he said, "All over," and that means there is no particular choice.

Now, then, he records as to the nature of the soil or pipe scale immediately in contact with the pipe and he said it was negligible. Then he records in the length of 24 inches the depths of 30 pits, his instructions being to find the deepest he could and measure at least 30 if he could find that many and then he recorded the description of the pits themselves. He said they were shallow to medium in depth. This is the general description and they were small to medium in size, clean-cut, numerous and scattered, and they were generally all over the pipe.

Then he also recorded something which we are recording for future study as to what is called "a pit pattern." That is not used in this case.

Now, he also shows the field—the figures also showed that the F. P. C. inspector made certain pit measurements some of which are given here, F. P. C. men being Messrs. Hashmall and Hayne. It showed there was an engineer representing Denver by the name of Gilbert and that a Mr. Ferguson of Canadian River Gas Company was also there.

Q. How does the Federal Power Commission's pit measurements differ from the pit measurements of your men?

A. Well, I haven't compared them.

Q. Can you look right there now?

A. Well, the deepest that Brown found was 60 mills deep.

Q. That's your man?

A. Yes, and there were pits here 60 mills deep. The deepest I can find from the F. P. C.—I do not know what their A. B. C.—this A. B. C. is here—

Q. I notice here the F. P. C. says here it varies from 15 to 60; is that right—the depth of the pits?

A. The pits that they measured varied from 15 to 60 in this group A and they have another group here which varies from 30 to 60, and another one in another group from 30 to 45. I do not know what the meaning of these F. P. C. figures are. We didn't use them.

Q. Yes, you didn't give those any consideration?

A. We gave them no consideration.

Now, the deepest pit was 60 mills as Mr. Brown found it. That was taken from these figures in the office, by the way.

Q. What was the shallowest pit?

A. The shallowest pit that Brown found, or the shallowest that he measured here was 30 mills, but he took off in the office the average depth of the 10 deepest ones that he found, the deepest being 60 and the average of the 10 being 53. That was work done in the office.

Q. That's just about all that is on that tabulation?

A. That's right.

Q. You went through on each inspection in the same way—in the same manner?

A. Yes. All of the inspections were made in the same manner.

Q. Now, you had this report before you—first, I will ask you this: There isn't on the face of this any estimate at all by the individuals as to the per cent of the depreciation?

A. That's right. They have recorded only facts as they saw them.

Q. And a per cent would not be facts?

A. That would be an opinion.

Q. Yes, that would be an opinion.

Now, you took these reports and looked at them and averaged out the percentage of depreciation for the whole group, did you not?

A. No.

Q. Well, what did you do?

A. My people in the office tabulated all of this informa-

tion with respect to the depth of the deepest pit and the 10 deepest pits and by sizes of pipe, calculated the progress towards different conditions of corrosion. They calculated those based on two different rates of slowing down in corrosion that are very important factors.

Q. What are they?

A. The Bureau of Standards has been carrying on corrosion tests of pipe in various soils all over the country for fifteen years or more, and they have made a very careful study of the behavior of pipe in 47 different soils throughout the country, generally the most corrosive soils. They have found as a result of their investigations which have been published in the various Bureau of Standards' publications—

Q. Have you got the Bureau of Standards' publication you used here?

A. No.

Q. Can you get hold of that or give us a reference to it?

A. There are several of them, but I'd be glad to give you the references.

Q. Yes.

A. And they reported on 47 different soils of which they had completed tests. Without exception they found that the progress of corrosion slowed down as the time went on. In other words, there was more corrosion in the first five years than there was in the second five years and more in the second than in the third, and so forth, and all but about, I think it's six of the soils which they examined showed a slowing down in corrosion, such that in the increase in depth in the second five years, for instance, would be less than half as much as it was in the first five years. There were about six soils where the second five years, for instance, showed more than a half which were distinctly abnormal soils not characteristic of this pipe line, such as peat muck for instance. There was one up in Wyoming which was essentially one of the salt flats or dry lakes, conditions that were quite abnormal.

Now, of the soils that were characteristic of this country the second five years, for instance, showed an increase in pit depths of only about a third of that which occurred in the first period. Wherever we have a pipe line system with a long history and lines covering wide territory of different ages we are able to find the rate at which corrosion slows

down. I have done it quite extensively in the Appalachian territory, for instance, and I find that a fifty per cent increase in depth with doubling the age, that means if it went twenty mills in five years it would go another ten in the next five years—represents the least slowing down that we get in that country and that corresponds to all but the six abnormal soils reported on by the Bureau of Standards; so we made these determinations in one instance on the basis of the corrosion slowing down so that in the second five years, for instance, the increased depth would be about half of that which occurred in the first five years, that representing what I have found to be my normal experience, and we made other calculations where the slowing down was such that the second five years, for instance, would only be a third as much which is characteristic of the slowing down of corrosion in the soils of this East and Rocky Mountain country that are generally dry soils without much rainfall.

Now, these calculations were made in the office, as I say, separately for each size of pipe and they showed the progress of this corrosion to the point of where there would be one penetration where the hole had just gotten through the pipe in 10 feet, 20 feet, 40 feet and 50 feet. They made studies of the possibilities of reclaiming pipe through welding, because when you take pipe out of the ground in the event of a replacement it is only a part of it that is so bad that you have to throw it away. Other parts of it, the pits are welded up and it can go back into the ground. I took that into account, and in other words, the salvage value for reclamation which is the common practice of pipe lines today and I had that all before me, the result of a great deal of analytical work in accordance with certain formula that have been published as representative of the phenomena of corrosion, by the chief of the underground corrosion division of the Bureau of Standards.

Q. You are going to produce that for us, aren't you?

A. I will give you the reference. I don't have the extra copies of that particular publication, but I can give you the reference; and we applied those mathematical relationships which have been published and incidentally which I find are borne out by my examination of thousands of samples of pipe.

Q. Why didn't you examine any of the samples of pipe in this line?

A. Examine what?

Q. Any of the samples in this line.

A. I don't need to. I have been studying the effect of these relationships for years and I don't need to make these examinations.

Q. In other words, you don't need to observe the pipe in order to observe the depreciation, do you?

A. I don't myself. If somebody will tell me the shape of the gasoline tank in my car and say the level is 25 per cent of the way down, I can tell you what portion of the gasoline is gone. Now, that's the equivalent of what I'm doing here.

Q. Even I can do that, but will you kindly tell us this: You said—the kind of soil—what kind of soil is this on here—answer my question.

A. This just shows a sandy loam soil that is dry.

Q. Now, that is all that is recorded on there?

A. Yes. I don't care—

Q. I'm asking the questions here.

That is all that is recorded on there?

A. Yes.

Q. All right.

You have all this information before you here. Will you tell us what per cent of depreciation has been brought about in this particular stretch of pipe right here?

A. You can't determine with any one piece of pipe any more than one can tell the insurance company how long I am going to live. You could do that just as well.

Q. In order for the insurance company to insure people they have to know the length of the lives of a great number of people.

A. Yes, that is right.

Q. These are your component parts, aren't they? You took these average conditions and arrived at an average answer, didn't you?

A. Each one of these is an individual and the group is the group of individuals upon which I am getting group insurance.

Q. Yes. You have said that you are an expert and I presume you are on erosion?

A. Corrosion.

Q. Corrosion, yes, not engines?

A. That is quite a different thing.

Q. I want you to tell us and to tell the Examiner here from all of your expert knowledge, assuming that this was the only piece of pipe that we are requiring you to tell the per cent of corrosion or per cent of depreciation of, to tell us exactly what the per cent—you are familiar with the soil table; you are familiar with the Bureau of Standards' figures as to the per cent of depreciation—I mean the degree of depreciation—just tell us exactly from the information here what the per cent of depreciation is.

A. You are asking me to do something which nobody can do. It can't be done.

Q. If you don't have the component parts, you can't very well have the whole?

A. I have explained to you that it can't be done any more than anybody is going to tell you and I how long we are going to live.

Q. Are those the rest of the working papers there?

A. No, no, no. All of this is the field—

Q. I want to see the next step in this process.

A. This is a field inspection and this is an identification of these locations in typewritten form.

The Trial Examiner: We will stand in recess for five minutes.

(At this point a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

By Mr. March:

Q. I believe that this sheet that we were speaking of a minute ago, you say Mr. Brown's name is signed to that sheet?

A. Let me get the sheets again. (Examining documents.) His initials "S. B. B." are signed to most of these sheets.

Q. Mr. Brown is now working with you?

A. No, he is not. I don't know where he is.

Q. What happened to him?

A. He left us.

Q. What do you know about his ability along the lines of measuring these holes?

A. Well, among other things, he has—had been doing

it for us for about ten years and furthermore he was given specific instructions and was generally supervised by one of my assistants, Mr. W. G. Smith who worked with me very closely in the corrosion studies.

Q. Do you know all the men personally who worked on these studies?.

A. You mean of my own staff?

Q. Yes.

A. Oh, yes.

Q. All right. Now, let's go to another point here: Look over here on your schedule on Page 36. Let's go to F. P. C. Account 372, Office Furniture and Equipment.

The Trial Examiner: Mr. March, before you get away from this corrosion business I'd like to ask Mr. Rhodes a question or two. Mr. Rhodes, do you have any known hot spots on this line?

The Witness: Yes, there are a number of them. I don't recall exactly where they are. There is one in the Arkansas River Valley on which one of my staff has installed cathodic protection during the past year. I am talking now of the Denver line as a whole.

The Trial Examiner: That's what I mean.

The Witness: And there is one other hot spot in the nature of a small salt flat on Canadian River's line that has had cathodic protection applied, but not completely worked out yet. In general the corrosion is not very great on these lines on account of the dry soil, but wherever the soil is wet, in river valleys or any of these little wet spaces where it drains out of an arroyo, there are hot spots there that are requiring attention. There have been very few places where the pits have gone through the pipe at the present time, very few, I think two or three instances have occurred in the hot spot near the Arkansas River which I was describing.

The Trial Examiner: And some pipe has been replaced there in those hot spots?

The Witness: I don't think they have replaced the pipe. Ordinarily when a leak occurs a band is clamped around the pipe with rubber packing over the hole and that practice is kept up as a rule until the leaks develop so frequently in

that particular location that it becomes an expensive nuisance and then one goes in and replaces it. At the present time cathodic protection is being installed in those places before it gets bad enough to warrant replacement.

The Trial Examiner: To your knowledge, none of that pipe has, we'll say, any material portion of that pipe has been replaced?

The Witness: I personally know of none that has been replaced on account of corrosion. Of course, there has been washouts where pipe has been replaced.

The Trial Examiner: I meant as to corrosion.

The Witness: I know of none, but I wouldn't be sure there had been none, but it is a very insignificant problem.

(Vol. XI, pp. 1535-1554.)

• • • • •

A. I concerned myself primarily with the all important item of pipe lines on which I had made a special study. Other parts of the property were conditioned by other men, or at least the field work was, but the final per cent condition on everything had to be made satisfactory to me. I talked with the men who, for instance, who inspected the compressor stations, buildings, and equipment, considered his reports and from his reports and the per cent depreciation deterioration that he found I assigned a figure which I considered to be a maximum amount of depreciation that existed in that property.

Q. And who was the man who made—that you talked to about compressor stations—depreciation of compressor stations?

A. Mr. Whittlesey who has been building and repairing compressor stations for us for the last ten years.

Q. Did he work for you?

A. He did. He still does.

Q. Let's see, now—compressor stations. Let's turn to that here. Well, you can have it here and we'll go over some of these things Monday morning.

All right, let's see, compressor stations—what is the percentage of depreciation?—well, pumping station equipment, 17 per cent depreciated. Do you recall whether or not you just adopted his figure or did you change his figure?

A. No, I talked to him and found out just what he had recorded and I reached the conclusion, knowing the equipment as I do, that in order to include all of the depreciation that existed in fact it should be increased. I don't recall the exact figures by which I increased his field observations.

Q. Do you recall whether or not he looked at all the engines in the compressor stations or just certain representative ones and made the analysis?

A. He examined all of the large units of the compressors and the auxiliary units, talked with the operators in the stations as to their repair and accident records and determined the extent to which these various wearable parts had worn out in service, and he had confined his figures purely to that extent. I took that into account and also the fact that it cost something to replace these worn parts when they are replaced, and added it to the total amount of depreciation. He had found an amount to cover all of the depreciation I considered could exist in that property.

Q. Well, now, you can have that report ready—his report ready Monday morning and we'll go into it at that time.

In other words, I am just picking out some of these items here which I consider representative.

A. Well, his reports are field notes. The summary of his report I assume is what you have in mind, his final figures.

Q. I want the information you had before you when you determined that the compressor stations had depreciated to the extent to which you have reported in your reproduction costs new statement.

Now, honestly, Mr. Rhodes, is there anything in the gas business that you think that you couldn't just look at and tell—I mean anything in the operating of a pipe line you couldn't just look at and tell by looking at it how much it had depreciated?

A. Well, I think that by process of observation I can tell a great deal more about how much it has depreciated on that property than somebody else could guess how long it was going to last.

Q. You didn't see very much—you didn't attempt yourself, though, to examine and observe directly the depreciation, very much, of this property, did you?

A. No, human life is too short to make it possible for one man to do all that, but I have been in all of the stations and I have seen considerable portion of the company's pipe that has been exposed where the depreciation has been bad, when I was studying the application of cathodic protection on this property and I believe that a man familiar with the business and with years of experience in the business can tell by an examination of the property a great deal more about what has happened to that property than anybody can possibly tell in any other way.

Q. Did you examine the houses, the houses down at Bivins compressor station?

A. I didn't myself, no. I have seen them recently. I have been in several of them.

Q. Let's see, how much depreciation do you have for these structures? Where is that in your report here?—structures and improvement; is that it?

A. I think it is in 352.1.

Q. Is it Page 85; is that right, the breakdown?

A. Just a minute. The dwellings at the Bivins station are included in the general plant structures and improvements and the priced inventory of the dwellings begins on 148.

Q. Now, what is your average percentage of depreciation?

A. Well, the average percentage depreciation of all those general buildings, dwellings, the office there, the warehouse and storehouse and welding shop and the machine shop, and so forth is 19 per cent depreciated.

Q. Did you have your subordinates make individual examinations of each of the living quarters and the details of all the equipment in the living quarters?

A. They examined the houses as to the condition, the foundations, floors, frames, roof, walls, and so forth. Of course the equipment in the building in general is owned by the occupants. The furniture is usually—the buildings are provided unfurnished.

Q. The fixtures in the buildings?

A. Well, to the extent they applied and they represent a very small part of the cost, and you don't spend a lot of time trying to condition something worth five dollars, for instance.

Q. All right. Were these men who examined these houses capable of appraising the depreciation of a house engaged in

that sort of business? What sort of business were these men engaged in?

A. Well, I must check as to which particular man inspected these houses. Let's see if I can do that. I'll have to look that up for you, but my recollection is, which I'll verify, it was the same man that builds compressing stations and the houses that go with them and has been doing it for me for quite a number of years.

Q. You couldn't tell me by looking at this court room how much it was depreciated, could you?

A. No, we don't do it that way. We examine those things in a house which a skilled engineer knows are the things which cause it to depreciate. They do not examine the superficial things.

Q. Could you examine this court room carefully—do you feel competent to examine this building and tell us what percentage is depreciated?

A. That could be done but it would cost quite a bit of money to do it.

Q. I mean, do you feel competent to do it yourself?

A. Oh, I could do it, but I wouldn't want to attempt it because it would be just a fruitless job for me to do it.

Q. You don't feel competent to examine one of those structures down at Bivins station and determine how much it has depreciated, do you?

A. I could form my opinion, but it would be a waste of money to have me spend my time doing that. I own a house, and I know something about the condition of a house. I have had dozens and dozens of them built for me and I have seen houses dozens of years after I built them.

(Vol. XI, pp. 1557-1563.)

* * * * *

Q. Did you—what about this engineering and supervision during construction? How does that compare with the costs of—you mean that is to be performed by some sort of firm like Ford, Bacon & Davis, Inc.?

A. Generally the independent operators of necessity have to get somebody who knows how to develop and build their project.

Q. How does that compare with your fee and the original cost of this property?

A. I haven't compared it.

Q. Did you take into consideration at all your original fee?

A. No, I based this on the experience that we have had in these independently-financed projects and arrived at these figures as fairly representing what I believe would be incurred in a similar circumstance.

Q. Now, in arriving at this engineering and supervision during construction, of course you had to consider what these engineering firms like Ford, Bacon & Davis, Inc. would charge this company, this independent company, for this service, didn't you?

A. Well, on the contrary I figured what the independent people are willing to pay a firm such as ours.

Q. Well, now, let's see, what sort of investigation did you make to determine and arrive at this 4.5 per cent?

A. Well, there were a number of projects on which I had complete information—natural gas, other utility projects, and a toll-bridge project which sometimes is considered a utility, in which I had the overhead costs analyzed to break them down as between—as nearly as could be—as between engineering and supervision during construction. On the one hand that includes inspection of work in progress in the field as well as the supervisory engineering, these miscellaneous corporate expenses, interest, and where there was any cost of financing, I did that, but in general that has to be determined separately and I also segregated from these general expenditures of those companies expenditures which we have not allowed for here, having to do with contracts and unusual expenditures in connection with licenses and so forth which some companies incur. The cost of financing was determined—

(Vol. XI, pp. 1564-1566.)

* * * * *

Q. Presuming this hypothetical reproduced property was not an independent newly organized company, but the same persons, the Rockefellers and Standard Oil Company who put up the money to begin with in regard to this project, were the backers of the project, then your cost here in your reproduction cost new assessed to engineering and supervision during construction would be less than it is here actually in this statement, is that right?

A. I don't know what it would be if any Rockefeller

furnished the money, because we looked to Christy Payne for the money.

Q. Of Standard Oil?

A. Christy Payne was the man I looked to.

Q. If Christy Payne was still with Standard Oil Company and this project was to be constructed and it was to be reconstructed new according to the plans you have set out here, the estimates other than the engineering and supervisory service, would you say that the cost of engineering and supervisory service to Standard Oil Company would be less than to a newly independently organized company?

A. Yes, it would be.

Q. How much less, approximately?

A. I don't know. I think of these undistributed construction costs myself as the combined engineering and corporate overhead because they are so closely tied one to the other that it is hard to separate them, but if you take those two together I should say that it could be done for possibly 25 to 30 per cent less than when such work is carried out for an independently promoted operation.

The Trial Examiner: You mean 25 per cent of all the items or—

The Witness: In the aggregate. Take for instance the engineering and corporate overhead during construction. It amounted to about 8½ per cent. When the work is carried out under the conditions under which we have worked for Christy Payne—I mention his name because our relations have been solely through him—that from 2 to 2½ per cent could have been saved of that, making it 6 to 6½ per cent or 7 to 7½ per cent.

By Mr. March:

Q. Who has your relations been with since Christy Payne retired in 1933? Whom did you deal with in Standard Oil?

A. In connection with construction of projects such as this we have done none for them.

Q. I mean, who did you negotiate your present retainer fee agreement with?

A. This retainer fee—I didn't negotiate it and I really don't know. I think it was negotiated with Mr. Gallagher.

Q. Of Standard Oil Company?

A. Yes, sir.

Q. In arriving at this engineering and supervisory charge during construction, did you not consult anybody, any other engineering firm as to what they would do the job for? You just relied upon your own firm's past experience with fees, so-called independent projects?

A. That isn't so. We have a few in which we have specific figures but we have been in business for more than forty years and these figures are not merely figures that are solely my experience but they represent the concensus of opinion of our principal men in the organization. As I stated, in the working papers I have my own personal experience explained which shows how that experience compares with these figures.

(Vol. XI, pp. 1574-1577.)

* * * * *

Q. Now we come to the cost of financing. I believe you have already testified that the cost of financing would be considerably less if Standard Oil were reproducing this property—Standard Oil and their associates?

A. I don't recall whether I have or not, but it is a fact.

Q. How much less?

A. Well, as related to this particular project, for instance, they made no specific charge for the cost of financing. Of course, when Standard Oil itself has to raise a lot of money in the market there are certain costs of financing involved, the extent of which I do not know as I haven't investigated.

Q. There wasn't any cost of financing at all assessed against this property?

A. I don't recall that there was.

Q. You don't know whether the Standard Oil Company had any trouble in getting hold of this money or not?

A. The money came as fast as required, which is more than happens on some projects.

Q. You didn't have any trouble in getting the money?

A. No, none at all.

Q. The cost of financing of this independent hypothetical company includes the financier's fee and all of that that goes along with it?

A. It includes all those things which represents the difference between the offering price of the securities as listed with the Securities and Exchange Commission and

the net amount of money the company gets. It includes the spread of the investment bankers who distribute the securities, it includes the out-of-pocket expense incurred by the company in connection with the issuance of the securities.

Q. I believe you stated here in the report that during the years 1935 to 1938 that the Securities and Exchange Commission's figures showed that the cost to the companies was on the average of 4.35 per cent to finance on the average—I mean the cost of financing?

A. That is right, 4.35 per cent of the net proceeds to the companies.

Q. You don't know what the cost has been during the last year, do you?

A. Oh, I don't recall. I haven't seen the figures during the last year.

Q. That is—

A. These costs have not been widely varied from year to year. They are dependent more on the type of business and on the type of securities than anything else. As I recall it, the cost of financing securities for the industries listed by the Securities and Exchange Commission as the extractive industries in which they list the production of oil and gas, that cost of financing is up in the neighborhood of 20 per cent or so.

Q. How much was it for gas?

A. They do not list them separately.

Q. How does it happen you made an analysis for this other far-fetched industry and didn't make an analysis for the gas industry?

A. I didn't make the analysis for these industrials. That is one of the classifications made by the Securities and Exchange Commission itself. It doesn't make a separate classification for natural gas companies. They are grouped with other gas companies and other utilities.

Q. You have just testified, as I understand it, that in considering the cost of financing it is very important to consider the type of industry that you are attempting to finance. You didn't consider the Securities and Exchange Commission's figures in regard to the cost of financing natural gas companies, did you?

A. I did not make a calculation at which I arrived at

four per cent but I did have an analysis made of the cost of financing of natural gas companies. I found tnat as related to the production end of it, which is classed as an abstractive industry, it was very much higher than the average, and as related to the natural gas companies whose securities have gone through the Securities and Exchange Commission, which are primarily transmission and distributing companies, even then the cost of financing was somewhat higher than the average, but the whole thing is complicated to such an extent by the exact class of securities issued that an exact figure cannot be assigned. It was for that reason I conservatively took a figure smaller than the average of the Securities and Exchange Commission.

Q. .355 per cent, less than one-half of one per cent?

A. It was almost ten per cent, one-tenth less than the average. You express it in dollars and the difference between four per cent and 4.35 per cent on a million dollars is a very tidy sum of money.

Q. I want to know the name of the publication of the Securities and Exchange Commission which you refer to here in order to get your average.

A. The annual reports of the Securities and Exchange Commission. It is just under that name. It will enable you to get at the average. They publish periodicals and other analytical reports giving the names of each and further details, which I don't recall. I have a list of such publications in my room at the hotel.

(Vol. XI, pp. 1582-1586.)

* * * * * *

Q. So you didn't give any consideration to the size of the companies in these particular cases, then, in view of the fact that one company is two or three times the size of the other and you used the same per cent?

A. Well, my sole thought in both cases was to use a figure that was lower than the average experience in financing, hoping that it would avoid a lengthy cross examination as it did in that case.

(Vol. XII, p. 1613.)

* * * * *

Q. Did you leave out any definite figures in regard to

going concern value because you wanted to keep from being cross examined?

A. No, I was requested not to consider going concern value except to explain that I had omitted it.

Q. Who asked you that you were not to give any consideration at all to going concern value?

A. My clients in this case.

Q. I thought here that—you say here on Page 31 in regard to going concern value:

"All elements of cost described above relate solely to the bare bones of the physical property or plant of the new company."

What do you mean by "bare bones"?

A. Well, that is a descriptive term indicating that the properties there, there is no business connected with the property which involves the expenditure of money in the negotiation of contracts. It means that while it may have an organization there to run the property, nevertheless, the organization has not yet learned how to run the property. In other words, we have something like a new automobile that you have to take back to the service station every two hundred or every thousand miles to put in shape, where fortunately the price of the automobile includes that service, but it costs somebody a lot of money.

(Vol. XII, pp. 1614-1615.)

* * * * *

Q. Well, let's see—so in the allowing of costs for training of your personnel and taking care of seasoning the line; you do allow for those two costs?

A. I have made no allowance for them in this reproduction costs new.

Q. I know, but you have in your going concern?

A. I have made no allowance for going concern. I have made no attempt to determine how much more it would cost to get this property seasoned after it was built.

(Vol. XII, p. 1622.)

* * * * *

Q. But you have here all the costs for a 22-inch main included in your reproduction costs new estimate?

A. No, not all the costs. I do not have the costs of

carrying the difference between the 60,000,000 a day and the 125,000,000 a day until the growth of the territory used it up. There is nothing in there to cover that, and that is the cost—one of the costs that must be met by somebody in creating a going concern out of a property that has just been constructed.

Q. The rate payers usually have to pay for the cost of service, don't they?

A. Oh, no, the company pays for it out of its gross revenues.

Q. But they get the revenues from the rate payers?

A. In this case they get the revenues under contracts that were negotiated.

(Vol. XII, p. 1625.)

* * * * * *

Q. Are you going to have a corporate structure as distinguished from your operating structure, your operating organization? Are you going to have any common stock?

A. I don't know.

Q. Are you going to have any bonds?

A. I haven't made any assumption that I would have anything. I have merely assumed that a corporation would be formed, a newly-organized corporation without the benefit of the things which they get from the large operators of these properties, and that that company, whatever may be its corporate structure, whether it is bonds or whatever it may be, will have the property built for it. Whatever the bonds and notes and whatever other securities might be issued would naturally be pictured under such an event by the investment experts and the relation of bonds to preferred stock and common stock, or notes, or what-not might be different, depending upon what the investors were demanding. I made no attempt to take into account a specific financial corporate structure. It has nothing to do with these overheads that are incurred during the construction period except as it may affect the interest during construction, and in that case investors in properties demand that all of the securities be sold in advance and all of the money be put in the bank before the property is started to be constructed as has happened in my exxperience; then that item of interest naturally will be much higher than will be the case if the money is forthcoming exactly as

needed to meet obligations. To that extent the corporate structure will affect these undistributed construction costs, but otherwise I don't see that it makes any difference.

Q. What sort of a corporate structure did you consider in that extent?

A. I didn't consider it specifically. I assumed it would be a relatively ordinary structure.

Q. What is a relatively ordinary structure?

A. Well, I have heard them referred to by bankers as a company, we will say, with forty to fifty per cent bonds, or thereabouts, and twenty to thirty per cent preferred stock, and the rest common stock. I have heard that referred to as an ordinary structure.

Q. You considered this company would be that type of company and would have that type of structure?

A. Not specifically. I just assumed normal conditions and estimated a figure which I thought would fairly represent interest during construction for a ten-months' construction period.

(Vol. XII, pp. 1639-1640.)

* * * * *

Q. I want you to tell me what this form letter was sent out in regard to; what prices?

A. This form letter, or a letter closely related to it, was sent out to the manufacturers of the equipment other than pipe. As to the people to whom it was sent out, I don't recall.

Q. Will you read it into the record?

A. This letter reads as follows:

"The properties of this company include items purchased from you of the kind listed on the sheets enclosed in duplicate. We will greatly appreciate having you fill in these sheets your lowest cash prices as of December 31, 1938, to a substantial and financially responsible purchaser less all discounts applicable to purchases in the quantities shown together with shipping weights and f.o.b. points. After being filled in, one set of the enclosed sheets should be signed and dated at the place provided therefor and returned to us in the enclosed self-addressed envelope. The duplicate set is for your files. It will be very helpful if you will give this matter your prompt atten-

tion. We appreciate that in answering this request it may involve some expense on your part. If there is any charge for this service, please send your bill to us and it will receive our prompt attention.

"Very truly yours,

CANADIAN RIVER GAS COMPANY,
Purchasing Agent."

Q. You did send out form letters like that to certain of the manufacturers, is that right?

A. That is the general scope of all of the requests for prices which we made.

Q. I will ask you this question: In any of these letters to these manufacturers did you tell them that you were going to use the figures for a valuation study or production costs new study?

A. In general they were told only what was disclosed in this form letter.

Q. Did you tell any of them you were going to use any of the figures for a reproduction costs new study, a valuation study?

A. I don't recall specifically that we did.

Q. I refer you to the working papers in regard to answers from some of these companies. This letter is dated July 6, 1939, from Ingersoll-Rand Company. I will ask you if that is a part of your working papers?

A. Yes.

Q. I will ask you to read the last paragraph of that letter—first I will ask you to read the heading of the letter, from whom it was written, and give the last paragraph.

A. This is a letter from Ingersoll-Rand Company dated Denver, Colorado, July 6, 1939, and it is addressed to Canadian River Gas Company. It quotes prices on certain compressor units and ends with the quotation in this paragraph:

"These figures are given for valuation figures only, which we understand is the purport of your inquiry.

"Trusting that this gives you the information which you

require and welcoming any further questions you might have, we remain

"Yours very truly,"

Q. It is from the Ingersoll-Rand Company?

A. The Ingersoll-Rand Company and signed by W. S. Grimshaw.

(Vol. XII, pp. 1661-1664.)

* * * * *

Q. Mr. Rhodes, what explanation have you got with regard to that statement in that Ingersoll-Rand letter relative to these figures for valuations?

A. Well, first you will note that they said they assumed something which was a wholly gratuitous statement on their part. Second, I have had figures from manufacturers where they were unwilling to make a quotation which would be a firm quotation. They want to hold themselves free not to accept a firm order at the quoted price. It may be low. The letter of inquiry which I read into the record which was generally used was the best I knew how to tell the manufacturers that I wanted real prices and it was well known in the newspapers that this company was going to be involved in a rate case, I assume. I can't imagine their not being in a position to assume correctly that these figures were going to be used for the purpose of evaluation. I wouldn't attempt to say they didn't know, but I can't imagine their being quite so dumb, shall we call it, as to not be aware of what was going on.

Q. You think this is very exceptional, in other words?

A. It is exceptional for them to say anything about it in their replies.

Q. Because in your letters you didn't mention that it would be used for valuation purposes?

A. Well, I didn't say anything about that. I told them the kind of a price I wanted and I assumed they gave us a price of that kind, and in cases where we found that that was not the kind of price we have ignored that kind of price and used a competitive price which we knew was the price.

Q. And none of these letters which you state were to be used for valuation purposes, is that right?

A. No, we don't tell them so. That's one of the de-

vices we used to avoid getting the high figures that were once alleged to have been used on valuations.

Q. Then why did you so inform them in this letter—first I'll ask you: Who is L. B. Whitefield, purchasing agent?

A. He is the purchasing agent of the Colorado Interstate Gas Company and he sent this letter out—

Q. Just a minute—

A. Wait a minute. You're asking me about a letter.

Q. Yes, sir.

A. That was sent out—this letter was sent out before I had submitted the form letter that I wanted to be used. I don't know what's in it, but I do know that.

Q. This letter is dated March 14th, 1939.

A. That's right.

Q. And most of this information is for 1939, isn't it?

A. Most of the information is as of December 31, 1938.

Q. The letters were sent out in 1939, weren't they?

A. The letters were sent out in the late spring of 1939, yes.

Q. All right. I'll ask you to state for the record who wrote this letter and to whom it was written.

A. The letter on the face of it states that.

Q. Who?

A. The letter is written to the Dresser Manufacturing Company and signed by L. B. Whitefield, Purchasing Agent, who is the purchasing agent of the Colorado Interstate Gas Company.

Q. The date of the letter is March 14th, 1939?

A. Right.

Q. I'll ask you to read the first paragraph.

A. "Please quote us for valuation purposes and on the basis of having bolts shipped direct from factory present-day prices of Dresser steel pipe couplings, Style 38, with extra-heavy Paranite C rubbers in quantities and with specifications as follows:"

Q. All right. Here is another letter. This letter is from whom to whom?

A. This letter is a letter from S. R. Dresser Manufacturing Company to the Colorado Interstate Gas Company, attention Mr. Whitefield.

Q. Dated?

A. March 30th, 1939.

Q. Will you read the last paragraph in the letter?

A. "We trust that this will give you the information you require for valuation purposes, and remain,"

Q. All right. Here is another letter—yes, here is the letter right here. Will you state from whom this quotation is and—

A. This is a letter from the Naugle Pole & Tie Corporation; that is, an attachment to a letter from the Naugle Pole & Tie Corporation to the Colorado Interstate Gas Company, attention to the purchasing agent.

Q. What is the date of the letter?

A. The letter is dated June 2nd, 1939.

Q. All right. What about this attachment? What does it say here at the top?

A. The letter says—this attachment which they filled in, has stating at the top:

"Please quote for valuation purposes in the following poles:"

Q. In other words, this was for poles. Poles for what?

A. Telephone system. Excuse me a moment. Off the record.

(Discussion outside the record.)

By Mr. March:

Q. All right, now. Here is another letter. Will you state the date of that letter?

A. June 30, 1939.

Q. From whom to whom?

A. From Southwestern Engineering Company to the Canadian River Gas Company, attention of L. B. Whitefield.

Q. All right. Will you read the middle paragraph there?

A. "For estimating purposes we would think that you could formulate a sufficiently close approximation through the knowledge that in 1928 these units sold for $4,600 f.o.b. cars, Channing, Texas. The estimated shipping weight was 25,000 pounds each."

This paragraph in itself is somewhat misleading.

Q. Is that your statement?

A. Yes, because the first paragraph in the letter states:

"We must inform you that several years ago we discontinued the manufacture of Collins Water Tube Boilers, so that we cannot give you the information you asked for."

Q. All right. Will you state to whom and from whom this letter was written?

A. This is a letter dated December 7, 1939 from the General Paint Corporation to the Colorado Interstate Gas Company.

Q. What is the date of the letter?

A. December 7th, 1939.

Q. Read the first paragraph.

A. "From our inquiry, we assume the information requested in your letter of December 5th is for some purpose of valuation and that you are not currently interested in a purchase of such a large quantity of pipe line coating."

Q. Now, this Dresser Manufacturing Company letter, I want you to identify as to what products you were inquiring about in regard to that.

A. That was the Dresser couplings used on the main lines.

Q. Pretty large item?

A. Several hundred thousand dollars.

(Vol. XII, pp. 1665-1670.)

* * * * *

The Trial Examiner: What page is that on, Mr. March?

Mr. March: That is from Page 44—begins on Page 45.

The Witness: The field inventory and the pricing of all buildings were carried out by a man in our organization by the name of J. C. Cook. He had the—in determining his unit prices, he had the assistance of a group of men working for me on the valuation of Hope Natural Gas Company, and to make sure that we were all using the labor performances that are established in our office as proper for buildings. He also had the advantage of consultation with a Mr. C. C. Whittlesey, who is one of our construction men who participated in the construction of some of this property here and who has constructed compressor stations with their housing facilities aggregating—

oh, somewhere between 70 and a hundred thousand horsepower in the past few years.

(Vol. XIII, p. 1749.)

* * * * * *

A. He saw each and every building, checking the inventory in the field with the book inventory and he determined the condition of a large part of the employes' houses.

Q. Yes, but he didn't determine the condition of all the employes' houses?

A. No.

Q. But on some of the houses he went in and actually made an examination of the house to determine the condition the house was in—how much it was depreciated—all of that?

A. Every house has been inspected for condition. He inspected most of them. The rest of them were inspected by another engineer who also inspected the major structures on the property.

Q. Who was that?

A. Mr. Whittlesey.

Q. Where is Mr. Cook now?

A. He is in New York so far as I know, but by this time he may have been assigned to work in any part of the country. I don't know where he is at the moment.

The Trial Examiner: Is he still in your employe, Mr. Rhodes?

The Witness: Yes, he is.

By Mr. March:

Q. Do you think you can testify here on this record that Mr. Whittlesey actually saw these houses—the greater part of them, he actually from his observation determined the depreciation of each of these houses, the condition the house was in?

A. Mr. Whittlesey only saw a small part of the houses. It was Mr. Cook that saw the most of the houses.

Q. Mr. Cook—I'll change that. Mr. Cook, did he see almost all of these houses?

A. Yes.

Q. And he did himself from his observation of the houses determine the depreciated condition of the house?

A. Yes, he made a report on each house?

(Vol. XIII, pp. 1752-1753.)

* * * * *

Q. If it had a concrete foundation it was depreciated just the same as the rest of the house?

A. No. They depreciated the foundation as best could be done by an examination of the foundation near the surface of the ground. The foundations of these houses are relatively unimportant.

Q. I would like to see your breakdown here of this item of chicken coops just as an illustration as to how you depreciate these various items. I wonder if you could obtain your working papers and we could have it in the record, setting forth just exactly how much depreciation you assigned to that particular piece of property?

A. I can't show you that because I myself did not assign any per cent condition to any particular house. My men reported to me on the condition of the various parts of the various buildings as to whether they were excellent, good, fair, poor, or bad. Those various ratings were finally translated into a per cent condition by me based upon my knowledge of construction of this type of building and my general inspection of the property, and the details as they were reported to me.

(Vol. XIII, pp. 1755-1756.)

* * * * *

Q. Let's see. You have your men go out and inspect these properties. They didn't assign any specific depreciation to these individual houses or anything, but they merely rated them according to the formula which you set up, is that right?

A. That is right.

Q. What is that formula which you set up?

A. Well, if they saw—inspect a building or any part of a building and could find no evidence of deterioration they rated that part of the building as excellent.

The Trial Examiner: Now you mean, Mr. Rhodes, their minute inspection of a foundation—that is, they take the house in its several component parts and rate each part of the house?

The Witness: Of the larger structures, not of chicken houses.

The Trial Examiner: I am not speaking of them.

The Witness: They examine each part; the foundations, if there are any, the walls, the roof, the framework and if they can find no evidence of deterioration there—in other words, if there is a percentage of being new or the equivalent of that, they rate it as excellent. At the other extreme they have a rating of bad which they give when they find considerable depreciation and where heavy repairs are imminent. On older properties occasionally buildings or parts of buildings are found which are rated much worse than bad—several degrees worse.

The intermediate ratings are good, which is where deterioration is just beginning to show up, but no repairs are indicated as likely to have to be made in the near future.

In fair, the deterioration is more pronounced and some repairs are required, but not too soon; and then you have poor, which is between fair and bad, where considerable depreciation is in evidence and considerable repairs are required soon but not to the extent of bad. These three intermediate degrees between showing no depreciation or deterioration and the rating of bad included the greater part of their ratings. Each one of these particular parts of buildings of importance were rated in that way. That was their field work. They received uniform instructions from me on this job and the other jobs that had been going on under my direction. The office work in connection with that was to weight these good, fair and bad, to find a fair over-all rating for the building itself and group of buildings where similarly—the condition of good, bad and fair, and so forth—was determined by weighting the conditions of the individual buildings in proportion to the cost. It could have been done as a percent condition but we were interested in getting an overall rating and it is a simple thing to do mathematically or by figures as long as these five different ratings are given five consecutive numbers. You get the weighted average and you can tell whether the average is between good and fair or good and excel-

lent, and by that means you will get an overall rating for the building or group of buildings.

Now, generally speaking, I have found that anything that shows up as being badly deteriorated and in imminent need of heavy repairs may be considered as being half depreciated. It is not possible to arrive at an exact figure but that is the intent in rating anything as being badly deteriorated. Heavy repairs are something which in the opinion of the inspector has lived half its life. As I said before, we found some very very bad structures that were in imminent need of being torn down but not in this property.

By Mr. March:

Q. Not on Colorado Interstate's property?

A. No, we haven't found any buildings ready to be torn down.

Q. Let's see, when anything is excellent, what per cent depreciated is it?

A. Very little, possibly five per cent.

Q. Five per cent?

A. On the average, yes.

Q. I see you have 5 per cent assigned to this pipe. I won't go into that, though.

When it is fair, what per cent is it depreciated?

A. On the average the ratings are excellent—will average 95 per cent. A building or part of a building rated as excellent might be new on the one hand or have been used up to 10 per cent on the other hand, and 95 per cent is a fair figure as applied to a group of properties. The fair would range between 10 per cent depreciated—no, the good would range between 10 per cent depreciated and 20 per cent depreciated and so on. The bad ranges between 60 and 50 per cent.

Q. Did you solely on your own initiative devise and invent this classification?

A. No, this clasisfication was the result of an extended conference with men, two men who have worked for me for a long time in the construction of buildings, a Mr. Whittlesey being one of them and Mr. Green another, who

have had long years of experience in construction and rehabilitation and conditioning of buildings.

Q. This Mr. Green, what is his profession?

A. Mr. Green is a Civil Engineer who has been working for us for fifteen years or more in work related to building construction, evaluation, and so forth.

Q. How many houses has he built: dwelling houses?

A. I don't know. Houses being a small part of it, I wasn't concerned. Mr. Whittlesey has built, however, the dwellings and all of these compressor stations we have built, probably two or three or four hundred of them. I don't know the exact number.

Q. Did he give any consideration to the date upon which he built the houses?

A. The date in itself is meaningless and we give no consideration to that except indirectly in old buildings which of course don't apply here. In old buildings—

Q. Where did you have old buildings?

A. On several properties that I have been making reproduction cost new studies on.

Q. Not in connection with these two companies?

A. No.

Q. Mr. Whittlesey helped you on the other two properties?

A. Yes. In fact, the methods for inspection of condition was devised by Mr. Whittlesey, Mr. Green, and myself.

Q. What is Mr. Whittlesey's profession?

A. Mr. Whittlesey is primarily a construction engineer who builds for us and is now building compressor stations with their housing facilities, pipe lines, and so forth.

I will give you his earlier training.

He graduated from Washington University in St. Louis in 1921. He worked during the summer months on various jobs while he was being educated.

Q. What degree did he get?

A. He didn't state here on this piece of paper. I don't know.

Q. He is—is he an engineer?

A. Yes. His earlier experience was with the engineering firm of McClelland & Junkersfeld in the building of

a large power station in St. Louis or East St. Louis that cost forty million dollars. He was an assistant civil engineer on that work.

After that and until 1925 he was with the Engineering Department of the Missouri Pacific Railroad, the Louisiana Division, making appraisals for the Interstate Commerce Commission work and in the investigation of wrecks, and so forth, for the Interstate Commerce Commission, and he was engaged in miscellaneous railroad construction work.

In 1925 I hired him personally to come to work with me in connection with a power station constructed in the Monroe Gas field. Since that time he has been with us primarily on construction work related to power plants, compressor stations, and pipe lines, and has done some rehabilitation work in connection with that and miscellaneous valuation work as it comes up from time to time; but he is primarily a natural gas compressor station construction man in the later years having, as I say, constructed for us a large number of compressor stations with structures almost identical with the structures on this property.

(Vol. XIII, pp. 1756-1762.)

* * * * * *

Q. Now, did he construct—on Page 46, I refe you to compressor house, one story and basement, steel frame, concrete foundation, walls and floors, and so forth and so on.

A. No, he didn't construct that house.

Q. Who constructed that house?

A. I don't know who constructed it.

Q. Has Ford, Bacon & Davis, Inc. ever constructed houses itself like that?

A. The Clayton station was constructed by one of the men on this property as selected by Mr. Hill and Mr. Trelease who constructed that compressor station and its various facilities. Just which buildings he constructed or which was sub-contracted I don't know. I haven't examined the records.

Q. Who was that man?

A. I don't recall his name.

Q. Did you consult him in the—

A. No.

(Vol. XIII, p. 1764.)

A. Here is the main compressor building at Clayton. The building is a type 2 building in which—which identifies the pricing of it. It has a concrete foundation, concrete floor, steel frame, corrugated *asbestus* walls, and roofing, steel sash, steel doors; it's 309,304 cubic feet. The foundation of that building was inspected and found to be poorer than excellent. In other words, he didn't want to say as much deterioration as good, but it was a little poorer than excellent. This is Mr. Whittlesey's inspection. I think he worked in the construction of that building.

Q. Are his initials on here?

A. Yes, "C. C. W." He found the columns of that building to be excellent; the siding fair; the sash excellent; the doors, good; the floor was excellent; the floor finish was only fair; the roofing was fair; and he has a note here that eight of the sheets were damaged in some way. It is not clear. The condition of the paint was poor; the lighting was excellent; the heating system was excellent; the plumbing was a little better than good, and the ventilators were good.

Q. What's this note down here at the bottom?

A. Some main compressor building wall cracks. That's the corrugated *asbestus* wall and there was some floor cracks.

Q. All right.

Now, you're an expert. You have before you this sheet here. Now, I want you to give us the benefit of your expert knowledge as to just the per cent to which this particular piece of property has been depreciated.

A. Well, I haven't presumed—

Q. Well, could you?

A. —to assign a depreciation to a single piece of property.

Q. Do you feel capable of doing it?

A. If I were going to condition this piece of property and no other piece of property I wouldn't be able to take advantage of the averages which I gave you in the ratings

as to excellent. I would have to go into it in detail, but when you're inspecting many pieces of property, the condition excellent will average out very close to the 95 per cent, but as related to this piece of property the percentage might be 91 or 99.

Q. So, it's like taking an examination in school. You fail a certain percentage of the class and give a certain percentage A and to a certain percentage B.

A. No, not like that.

Q. All right, we've got this one piece of property here. I want to test your expert knowledge. We've got this one piece of property here and I want to know from the data which you have before you here, just exactly how much that piece of property has depreciated, what is the depreciated condition of that piece of property?

A. As related to this one piece of property, as I have already stated, this information is not as much as I would want.

Q. What else would you want?

A. I would want more information as to why he called the foundation a little poorer than excellent. I would want more information as to these wall cracks and so forth. I would devise a greater number of ratings. This building, as I say, might be anything within the range of these ten per cent steps.

Q. You couldn't tell from this?

A. But when you take a group of buildings, the overs and shorts average each other out and you have—if you are familiar with the buildings and the man who inspects them is familiar with the buildings—you can have a very good rating as to the condition of that building.

Q. You mean to say this, that if you had, say, we had a hundred compressor stations instead of one compressor station here—I have a hundred sheets of paper here with the same type of information on the paper that is on this one piece of paper—

A. That's right.

Q. —then you think you could tell what the depreciated condition of the group would be?

A. If the man who inspected it inspected this building.

Q. Well, isn't it true that the parts make up the whole? If you can't tell the depreciated condition of one compres-

sor station, how can you tell the depreciated condition of many compressor stations when you don't have any more information on the group that you have on the individual parts?

A. You do have one phenomena of nature, that you can always rely on, that when you rate a great many things with a range in the rating that the average of those ratings comes very close to being the middle. That is the case in almost everything that is encountered in nature.

(Vol. XIII, pp. 1766-1769.)

* * * * *

Q. Now, let's turn to one of these wooden houses—any wooden house there—any wooden house you've got there.

A. Well, here is a group of wooden houses that were inspected by Mr. Cook and they are concrete foundations and wood frame and roof with composition shingles and wooden sash. The foundations of all of them are rated as excellent. They were all built at the same time. The frames of all of them were good; the sidings were good; the sash was good; the doors range from fair to good; the floors were poor to fair; the roofing was a little better than fair to good, and the paint was fair to good, and in the different houses the condition of the electric lighting was good to excellent; the heating system was fair in most cases, good in one case, and the plumbing was fair to good.

Q. Now, is that for an individual house or for a group of houses?

A. The ratings assigned here are the ratings obtained by inspecting each house.

Q. Well, let's see, now. You're reading from this—this reading here, that is Dwelling No. 1, you were reading in regard to Dwelling No. 1, Dwelling No. 2, Dwelling No. 3 and Dwelling No. 4.

A. I was looking at the group of dwellings from 1 to 8 and giving you the range of the conditions of the parts as he found them.

Q. All right, I'll ask you the same question I asked you in regard to the compressor stations. Now here you have a little different picture. Instead of one house you have a group of houses. Now, from your vast knowledge of houses, I want you to tell me from that information the percentage of depreciation from those houses.

A. Well, I haven't determined that. I'll be glad to tell you what I did with respect to the total—with respect to all the buildings in that group.

Q. You have all the mental faculties you had when you did that, haven't you?

A. There is a great deal of work to be done before the mental faculties are brought into place.

Q. All right, let's go through that work.

Now, you have this information before you. What else have you got to determine the amount of depreciation there of these four houses—just ~~these four houses~~?

A. Well, I haven't determined it.

Q. Well, what else would you have to do if you did?

A. Well, if you had to do that you would have to assign a rating number to excellent, good, fair, and so on, which might be 1 to 5, or 10 to 15, or any other group of consecutive numbers you wanted to. It doesn't make a darn bit of difference which—leave out the "darn." We would know from the analysis of reproducing these houses that the foundations cost a certain per cent of the total, and the frames cost a certain per cent of the total, and the sidings and the sash and these various parts inspected cost a certain per cent of the total.

Now, these rating numbers assigned to excellent, good, fair, poor and bad would be weighted in the proportion that the parts contributed to the costs of the whole building and if, when they ended up, they averaged the number that we assigned to good, that particular group of houses would be called good as a whole. If it was between good and excellent, we might call it good plus or excellent minus, and we would thus have a rating of these—of this group of houses, which we wouldn't attempt any closer than good plus or good minus, or as the case may be.

Q. In other words, you would have to know first what foundations cost, plumbing cost, and the roofing cost, and that would be the first requisite, is that right?

A. Yes, that's the first step.

Q. Now, as I understand—I want to get clearly in the record just exactly your method. As I understand it, it is sort of like the judges do when they go out and have

a prize cow contest or something like that. The judges have rating sheets and they look at the cow and say, "This is good, excellent—the grade on the hind legs and front legs and horns—and the condition of her skin," and all that, and come up to a grand total, is that right?

A. No.

Q. How long would it take you to figure out for us right here in the hearing-room about these four houses, just exactly?

A. Well, it would be a waste of time for me to do it. I could figure it out, but I have figured out here, though, everything relating to the condition of the group of buildings in that account at that compressor station and I can show you just exactly what I did with respect to the whole, but I didn't figure the condition of the houses separately and it is not a part of my method.

Q. Say you were just an ordinary person and not an expert, and you see standing out here a steel building, a steel and concrete building, and standing over beside it is a wooden house. Which would you say would last the longer?

A. I don't know. I have seen wooden houses older than any steel building that exists.

Q. You wouldn't know?

A. Well, I've just answered. It depends entirely on how the building is taken care of.

Q. In making this study, you made no attempt to study the respective durability characteristics of wood and steel?

A. Yes. We took that into account by what could be seen by observation as to whether there had been deterioration or not, and the relative durability of the different materials in these particular buildings is shown by what has happened to them in the period that they have been in existence.

Q. Now, you threw in here and assigned, I believe it is 14 per cent depreciation to the same—to chicken houses, hose sheds, steel and compressor stations, five-room dwelling houses of wood—you assigned the whole group a 14 per cent depreciation.

A. To the group, yes, but to the individual buildings, no.

Q. Well, now, how much longer do you think, from your experience, do you think that those steel and concrete com-

pressor houses are going to last than this wooden hose house?

A. That depends on whether the company keeps them up or not. The wooden buildings could be kept in shape—could be made to last as long as the steel buildings if it was so desired.

Q. Well, what do you think about the respective life of these properties—these types of properties, if they are kept up in the ordinary manner that they are being kept up now? Do you think that the steel house might have 100 per cent longer life than the wooden hose house?

A. Ordinarily when you go to the extreme of a wooden hose house and a compressor station building you are taking a rather ridiculous range.

Q. That's just what you have done here, isn't it?

A. No.

Q. Well, you have here—I notice here you have tabulated in your Account 352-1, this steel compressor house and in the same account with your wooden hose house, and the whole group you assign a 14 per cent depreciation.

A. I assigned it to the group but not to the individual—

Q. Yes, but you do have all of it stacked in here in one account.

A. Yes, they are put in the account that calls for such structures to be—that calls for the coverage for such structures.

Q. All right, now, let's move along here to the pumping station equipment, say—354-1. Is that where your engines are located?

A. Yes, that's where the compressor units are included.

Q. All right. Let's turn to that. What page is that on—the breakdown?

A. Are you referring to the priced inventory?

Q. Yes.

A. It begins on Page 108.

Q. Now, these engines here, compressor engines, I believe they are concrete foundations, are they not?

A. Yes.

Q. And they are bolted down to these concrete foundations?

A. Yes.

Q. Now, what detail did you go into personally to determine the depreciation of the engines?

A. I personally determined, in consultation with Mr. Whittlesey, the method of finding the condition of these engines.

Q. What was that method?

A. Mr. Whittlesey went out to each and every one of these compressor stations and determined the condition of the wearing parts of the engines which wear out in service. For instances, in gas engines the cylinders wear out from time to time; the pistons and the piston rods, and the crossheads; the valve gear, and like parts. That represents approximately 30 per cent or thereabouts of the cost of such equipment. Generally the main frame and the shafts and the fly-wheels don't deteriorate. If they ever are replaced they are replaced as the results of accidents. That 70 per cent is not considered as depreciated.

Mr. Whittlesey reported to me as a result of his inspections, weighting the cost of these various parts which do depreciate, and gave me an overall rating that these wearable parts had worn out to a certain percentage.

Q. Where is that? Is it handy there—Whittlesey's report?

A. These are Whittlesey's reports.

Q. Let's see one of his reports.

A. Well, here is a report on the Clayton station. This would be main unit No. 3, and the company's numbering, and it's 1,000 horsepower, 125RPM unit, of Worthington manufacture, the bore of the power cylinders is 20 inches and the stroke is 36. That is in error because the bore is 22 inches, but that point is purely an error in writing down, and there are two compressor cylinders 15¾-inch bore.

Now, he rated the—considered the power cylinders, the parts that wear out. There are four power cylinders on each of those engines, two on each side, a right-hand and a left-hand; and he rated the valves and the cylinder castings in each of those four cylinders as excellent. He found the liners in the cylinders which are replaceable liners that wear out, as good; the cylinder heads as excellent; the

piston rods as fair; and the pistons and rings fair; and the packings good. They represent the principle parts that wear out in the power cylinders. Those parts of these power cylinders which can be seen are examined and their condition determined. The records of the station as to replacements and general performance of the engine is determined by consultation with the records and with the Chief Engineer of the station.

Then he rated the exhaust valve which involves a depreciation of wear and tear that is characteristically different from other things, and he determined the conditions of the valve casings as being excellent; stems, excellent; stem guides, excellent; the springs as good; the exhaust elbows as excellent; and the pipe and fittings in the exhaust of the engine as good.

Then he examined the other valves and mechanism, like the gas mixing valves, the air starting valves, and the camshaft and the valve mechanism and the cams and the layshaft and the gears and the governor mechanism, and they were all found to be in excellent condition.

Then he examined the bearings and cross-heads—determined them by the behavior of the engine in operation and found them to be in excellent condition.

Then he similarly rated the parts of the compressor cylinders and the liner and the piston rods and the piston rings and the valves which are rated as in fair condition; the unloading mechanism as in excellent condition, and the packings as poor.

Q. Now, what are these red things on here—94 and 82—what's that—in red on there—not a part of Mr. Whittlesey's writing?

A. These figures as related to each of the engines is a weighting of these excellents, goods, and fairs, and so forth, with the non-wearing parts to find the equivalent numerical rating which corresponds to 95 per cent being excellent, and so forth.

Q. So this—

A. This is a first step in determining the condition of the equipment in that station.

Q. Does that 94 per cent mean that it is 6 per cent worn out, this particular engine—this particular portion of the engine?

A. A group of engines with that rating would mean that 6 per cent was worn out, yes.

Q. I'm talking about this engine. This engine has 94 in red letters here in somebody else's handwriting besides Mr. Whittlesey's and I want to know here exactly whether or not that means that this engine—this portion of the engine, is 6 per cent worn out.

A. Not precisely. It may be plus or minus a number of points because the rating of each individual thing; that is, averaging up, is only within a range of 10 points, and as related to this particular engine, a more complete and detailed inspection might result in a somewhat different figure, but we find that as these inspections are averaged up with a group of property, that uncertainty disappears.

Q. Yes. Now, in other words, you want to change your testimony, then, that you didn't give individual depreciation ratings to these individual units?

A. Why, not at all. I have just testified that that is not the rating except within a range of uncertainty, but it is the first step in finding the per cent condition or the per cent deterioration in all of the equipment in the station.

Q. Which first step is the rating of these individual units, and you might change the overall group when you get all of the figures and consider them together?

A. If you took all of the engines in this property, all of the 1,000-horsepower engines, which is 8, the average of these figures would be rather close to representing the extent to which the parts of the engines had worn out.

(Vol. XIII, pp. 1770-1780.)

* * * * *

Q. Where is your sheet on the concrete foundations of the engines?

A. There is no sheet. I have testified in the explanation of this reproduction cost that the engine foundations, various piping, and so forth, connected with the engines was given the same rating as the engines. The prime reason for that is that in general when an engine is retired

permanently from a station the foundation and pipe are also retired from the books of the company. They go together so we put that equipment that depreciates very very little in the same condition as the engine. If we are going to keep the foundation and the piping for the instaliation of some other engine, we would have over-depreciated it, and if anything, it is over-depreciated by adopting that method.

Q. You say the concrete foundations are over-depreciated?

A. From the purely physical standpoint, yes. They are put in the same condition as the equipment in the station, not each engine foundation but all foundations as a whole.

Q. How do you know that they are over-depreciated here since you state that you did not make any attempt to ascertain the amount of depreciation of the concrete foundations?

A. Because physically they would all be rated as excellent because that is their condition by themselves, but they are less than excellent as far as usefulness is concerned because if the engines are 15 per cent depreciated and the foundations have to go with the engines, it would be foolish to say that the foundations were in 100 per cent condition, even though they might be physically so.

Q. So you took into consideration when you placed depreciation on items as to how useful they were, is that right?

A. That is not quite the interpretation of it, no, and I wouldn't say that I did that. On the other hand, I have depreciated at the Canyon station at a very low value a certain building, the usefulness of which is rather indefinite, and that building has been marked down on that account, but that has nothing to do with the fact that when an engine is permanently retired the foundation is retired with it. The foundation is 100 per cent useful all the time it is there.

Q. As a matter of fact, the foundation may outlast the engine?

A. I have said it does; that foundations are rarely retired—engine foundations—except when the engine itself is permanently retired from service.

Q. You wouldn't have to even look at the concrete, then, to determine the amount of depreciation of the concrete?

A. In general, no. There are stations which I have seen, however, where foundations have deteriorated to such an extent through ground settlement that the inspection of those engine foundations in that particular station would have resulted in a considerable mark-down which was later corrected by the installation of suitable underpinning.

Q. In determining the depreciation of concrete, would you think it would be advisable or helpful to take into consideration how long the concrete had been laid?

A. You can tell by the looks of a concrete foundation whether it is deteriorated or not, and whether or not that deterioration is likely to result in a heavy replacement of a part. That sometimes happens. Parts of foundations fall off due to the concrete not having been good concrete and they have to be replaced. If anything like that is found which rates a foundation below the corresponding rating, in the manner I have described, that foundation is so marked down in the determination of the depreciation.

Q. Say one of these engines down there would blow up. Would you say that you would put another engine on the concrete foundation?

A. That depends upon the extent of the blow-up. Furthermore, that is an accident against which it is not possible to figure depreciation.

Q. You don't really know much about concrete yourself, do you?

A. Well, there are hundreds of thousands of yards that have been poured on jobs which I have been closely associated with, and a considerable part of it on jobs where I have been out in the field and have been responsible to see that it is carried out.

Q. So much for that.

There is just one question so the record will be entirely clear on it.

Would you depreciate the concrete 12 per cent? That is the amount of depreciation of pumping station equipment. You would depreciate concrete foundations 12 per cent because the engine showed 12 per cent depreciation?

A. I assigned that percentage to the concrete foundation as a whole because the equipment and the station was depreciated 12 per cent, yes.

Q. Now, in order—

A. A small portion of the whole station depreciates less rapidly in fact than the engines has been depreciated by me as much as the engines.

Q. In order to really do a workmanship job of determining the depreciation of the engines it would really be necessary to dissemble some of the engines, wouldn't it, one of the engines, or something like that, and examine minutely the wear and tear of that engine?

A. If you did not know anything about engines and you had no information as to their past history for repairs, it would probably be necessary to spend five or six thousand dollars to dissemble one of these engines and put it together again, but to one who is familiar with engines and knows how they act, and knows what the conditions are, knows what the cost of replacements are, he can tell the condition of an engine by inspecting the visible parts, having the engine operated for him, and investigating the replacement records as for cylinders and pistons, and so forth, in the past, and he can arrive at a very good measure of the condition of that equipment; and when that measure of his is applied to a group of equipment the uncertainty washes out.

The Trial Examiner: Do you know, Mr. Rhodes, whether consideration was given to the past operating records of the engines as to replacement of parts?

The Witness: All I know, of course, is what Mr. Whittlesey told me that he did in carrying out my instructions, and after years of experience with the man I learned to believe him.

By Mr. March:

Q. I have something in mind here. I don't know how it will work, but before I even attempt it I want to know if it will be possible for you to tell the answer.

If I have a man come in here with one of these pistons and put the piston in front of you and I ask you how much that piston has depreciated, do you think you would be capable of telling me?

A. It takes more than just looking at the thing. It

requires some records in the case of these rapidly wearing parts, as to how long they have been in use since they were replaced, which information can be obtained from the records, and what has been the experience in that station. The visible evidence is only one of the things that you take into account. For instance, a piston rod may be worn, be very rough, and look as though it were going to have to be replaced very soon. A piston rod, however can be turned down on the lathe and go through a number of those experiences but finally there is so much of it that can be cut off that it has to be replaced. It takes skill and knowledge of equipment and it take a knowledge of what has happened previously to assign any condition to that particular piston rod.

Q. So you wouldn't attempt to tell me the depreciation of the piston?

A. It takes this other information.

Q. You wouldn't attempt to observe the piston and tell what percentage of the depreciation had taken place just from observation?

A. No. One could have a piston that had been turned a number of times for putting in new piston rings so that the next time it happened it would have to be scrapped, or the piston might be a brand new piston that apparently had some cracks in it, or the piston may be one that had been subject to overheating through overload or through scale forming inside, and you could have a piston that looked perfectly good by itself but if you didn't know anything about its past history you couldn't condition it.

Q. In other words, I would have to bring the record with me as to the life of the piston and what it had been used for and how much it had been operated and all that?

A. Those things would have to be taken into consideration. You will recall my stating that the rating of any individual thing may be within quite a range of uncertainty, but the rating of the large aggregation of those things iron out those uncertainties.

Q But in examining these engines, the various parts of these engines, you have testified here as I understand it that you did not have to have before you the record of performance of the engine.

A. I have not testified to that effect.

Q. It was necessary to know when the engine was purchased and its record, wasn't it?

A. I didn't say anything about the age of the engine itself but the length of time the various parts had been used. Take, for instance, an engine may be 20 years old and used very very little. That engine is almost in the same condition that it was in when it was bought. On the other hand, an engine may be given terrifically hard use continuously for four or five years and be in very bad condition. Age itself is only one of the things. Indirectly it counts as it offers an opportunity for the engine to be used.

Q. What else did you have the record of in making this, the record of how much these houses were used?

A. Houses don't wear out except by rotting because they are static things.

Q. They wear out depending upon what type of people are in the houses, don't they?

A. It is perfectly evident what has happened to houses—you can tell what has happened to the house when you look at the house. The parts that wear out from the people being in them are quite obvious. The thing to look for in houses are the hidden parts, the under-pinning. When that rots—once in a while we have termites that cause extensive damage to a house but those are not the things that wear out—that are worn out by the occupants.

Q. Some of the engines—you just looked on the outside of some of the engines and you didn't attempt to determine the condition of the inside of the engine.

A. The engines were not dismantled for the purpose of determining their condition.

Q. You don't think any engineer could go down to one of your plants and by observation determine the depreciation of the engine unless he had before him the record of the operation of the engine, do you?

A. He should know what had happened to that engine. He should know about the policy with respect to replacements and whether the engine had a good operating record or one that was subject to frequent breakdown. He takes those things into consideration and if he is experienced and knows what he is doing he can fairly determine the extent to which a group of these engines has deteriorated as related to anyone with less prescision, but as related to the

group he can determine, I believe, quite accurately. You must bear in mind that very little equipment from the standpoint of wear and tear ever gets worn down to more than 30 per cent depreciation and he is trying to find where it is, somewhere between the 70 per cent and the 100 per cent.

The Trial Examiner: We will stand in recess for five minutes.

(At this point a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

By Mr. March:

Q. Mr. Rhodes, you state, I believe, that it is necessary for you to have some record of performance of the engines before you in order to determine the depreciation. That is correct, isn't it?

A. You should have it.

Q. I want to see your working papers which will show the record of performance of these engines.

A. These working papers do not show it. That is one of the things the inspector determines by questioning and these particular engines have comparatively little replacement that has been suffered. In going over the inspection reports I haven't myself noted that, but it is not customary to make a record of that in these inspection reports unless there is some unusual feature involved.

Q. You don't have that information before you?

A. No. The man who rated the parts, however, had the ability to see the engine, to see it run, to see the station logs, to talk with the operators. You don't make a specific calculation of these specific things that have occurred. The individual parts are rated within a range of tolerance.

Q. Some of the engines may not wear out at all, is that correct?

A. If they weren't operated, they wouldn't.

Q. So part of the engines are comparatively not depreciated at all?

A. That is what I have stated. The main frames and fly-wheels and so forth are never replaced except as the result of an accident. There is no depreciation assignable to them because of the fact sometimes you have an accident.

Q. In determining depreciation here, why was it you took the engine in its repaired condition? You considered the engine in its repaired condition?

A. We took the engine as we found it.

Q. A large part of the engine might have been replaced?

A. Yes. It is conceivable it may have all been replaced. I have known of engines that have been completely overhauled and everything that was more than slightly worn was replaced, and when you get through those engines would rate as being in excellent condition even though they had been given terrible abuse for several years.

Q. Did you make any check to ascertain whether any of these engines had just been repaired and put in excellent condition before you made your—attempted to make your determination as to the depreciation?

A. I didn't, no. Mr. Whittlesey took into account everything he could ascertain as having a bearing on it. I took into account something else when I adjusted his final figures.

Q. What was that?

A. That was this, that a large amount of equipment in a number of compressor stations that have been well seasoned tend to approach the point of about 15 per cent depreciation. In other words, some parts last ten years, some fifteen, some five, but as this property gets seasoned with the various replacements of these parts the tendency is to approach about a 15 per cent depreciation. A property that has been abused or that is very old may well have depreciated more than the 15 per cent and a property that is relatively new and well taken care of will have depreciated less than 15 per cent.

Q. But you didn't give any consideration as to whether the properties were relatively new or relatively old?

A. Only to this extent: If a man reported to me that all of the equipment in the compressor stations that was very old was in 90 per cent condition he would have to prove it to me.

Q. I want to see one of those reports.

A. You have just been looking at one.

Q. This report doesn't say anything about age on there.

A. No, because I know just within what a few years—it doesn't make any difference. If I had a bunch of stations with engines in them twenty-five years old or more and he reported them to be in 90 per cent condition, he would have to prove it to me.

Q. In other words, you couldn't rely just on observation as to the depreciation? You would have to take into consideration the age?

A. I would question the work he had done. I mentioned that these variations in the overall condition are merely one of the guides to a man who is experienced in the gas business that can be used to determine whether or not his field men have done what he told them to do.

Q. What did you tell them to do? Did you tell them in this case to tell you how old the engine was?

A. No, I told them to find out how much the engine had worn.

Q. Say that I bring in a piston. Are you going to want to know how old it is?

A. I have already told you it wasn't practicable to condition a piston by itself.

Q. You couldn't tell?

A. We only determine the extent to which the condition of a piston contributes to the condition of the whole engine. These things are all inter-related one to the other. The piston itself doesn't depreciate very much. It is pretty much an accident that causes them to be replaced, but we take into account a condition of a piston if we find out that pistons are cracked, if we have a series of troubles with them as we have had in some stations with pistons cracking, and if that condition was continuing in the station, and hadn't been cured, those pistons would have been put on the average in bad condition. That is a condition that has been carried pretty generally in stations.

Q. Say that this desk here is an engine. You are on the stand up there, an expert, and I will ask you to tell us what the depreciation of the engine is. You are not going to want to know how old the engine is?

A. Only within a wide range of years.

Q. How many years?

A. We would be interested in knowing whether it was 10 or 20 years old but we would be much more interested in knowing how many hours it had run, whether it had been overloaded or underloaded or low speed or high speed. If you want to be specific with reference to a specific engine you have to take all those things into consideration, but as related to the group that can be taken into consideration more generally because the individual things—

Mr. Brock: Let me interrupt you there.

You said "condition" when you meant "consideration." You have said that a number of times.

The Witness: That is right.

By Mr. March:

Q. Coming now to the concrete again, you say that you know quite a bit about concrete?

A. I think I know something about it.

Q. Do you know whether concrete depreciates or not?

A. Some does, some doesn't.

Q. Did you ever hear of any concrete that didn't depreciate?

A. Well, I have known of concrete that has lasted a good many years without any evidence of depreciation, and I have known concrete to go to pieces in one year.

Q. Would you say that some concrete really gets better with age?

A. Up to a considerable length of time, yes, and just how long that is, we don't know, but for the purpose of supporting an engine it doesn't have to get better. As long as it doesn't get into the condition where it no long supports the engine it hasn't depreciated materially.

Q. So you handled the concrete in connection with its functional performance in regard to what it is connected to?

A. That might be one interpretation of what I have done as related to the engines, yes.

Q. That is all on that angle just for the moment.

I want to direct your attention to when we were talking about pumping station equipment. On this exhibit we are talking about now under Colorado Interstate you have 12 per cent depreciation. On your Canadian River you have for the same property 17 per cent. Can you explain any reason for that?

A. Well, there are a number of reasons for that. In the first place, the Canadian River field station and any other field station has a more continuous use than the line station. The difference is roughly in the capacity of this line to handle gas and whether all of the line stations are in or all of the line stations are out is only about 2 to 1, and consequently, there is a considerable part of the year where the stations on that line are not in use and they are not

being used so much—not being used so much they don't wear so much.

Another reason is that we found on inspecting the pipe—the piping around in the yard of the Bivins station, that there was considerable deterioration in excess of that found in the yards of the other stations.

Q. Is the pipe included in this pumping station equipment?

A. Yes, all of the pipe that forms a part of the station beginning with the suction main and going on through the intricacies of the station and ending with the discharge into the main. It represents a rather large sum of money.

Q. About how much?

A. Generally speaking, from 10 to 15 per cent. I can tell you more specifically as related to these stations. In these stations the pipe valves and fittings represent almost 42,000 out of a total of $338,000. That is more than the 10 per cent figure I mentioned.

Q. Can you think of any other reasons why pumping stations of Canadian River are so much more depreciated than those of Colorado Interstate?

A. The fact that it was found on some examinations really is controlling.

Q. I want to know what proof you have, what evidence you have that the Canadian River pumping equipment is operated more than the Colorado Interstate pumping equipment.

A. Well, I haven't checked into the details but I explained to you the characteristics of pipe lines that have the varying load that this Denver line has. They certainly don't operate engines just for the fun of it. They operate them when they need them. I know from having been out here that Colorado Interstate's stations for the most part have been practically cut down cold all summer long.

They are just winter stations. The Clayton station has been running more than the others. The field station on any pipe line that puts the gas into the line has to run all the time unless the suction pressures happen to be high enough to avoid it. That has happened at times here.

Q. Did you take that into consideration when you put a greater depreciation on the station?

A. No, not specifically.

I have explained to you that the depreciation we put on this equipment is that which was found there. It wasn't theorized on how many hours it was run. That was known to be sure, but going into the stations you can very easily find the operating records of the station.

There again it is not a specific factor where you write the station down for so many per cent for each hour the engine runs. You don't do that, but I explained these conditions in answer to your inquiry "Do you know any reasons why you would expect to find Canadian River's equipment depreciates more than Colorado Interstate's equipment?"

Q. The only reason you have here is because Mr. Whittelsey said so?

A. You might put it that way. It was a man thoroughly familiar with the equipment who himself inspected it that said it was depreciated more than that of Colorado Interstate. One learns whom he can trust and can't trust when he has been in the engineering business as long as I have.

Q. On the contrary, we find that Canadian River's pumping station structures—I presume that is the structure over the station—has depreciated much less than the structures of Colorado Interstate Gas Company.

A. Well, I think I have already made a reply to that question but I will be glad to give it again if you would like to have me do so.

Q. Is that just because Mr. Whittelsey said so, is that right?

A. No.

Q. Because Mr. Cooke said so?

A. No.

Q. What else did you have to go on?

A. I had to go on this: The Canadian River's compressor station's buildings are limited to compressor station buildings proper which are steel structures with asbestus siding that does not deteriorate rapidly, whereas, Colorado Interstate's compressor station structures include also the housing of the employees which does deteriorate more rapidly than the steel buildings. That is the reason you should expect to find more deterioration. Of course, these figures of mine are not based just on the say-so of men, they are based upon the determination made by careful inspection by men who know what they are talking about.

Q. So any man with common ordinary sense would know that the concrete structures depreciate at a slower rate than the wooden structures?

A. Generally, yes.

Q. I direct your attention to Account 352-2, Land Rights, Rights of Way. It is on Page 32.

A. Yes.

Q. I notice here that you have over $177,000 as reproduction costs new of [illegible] land rights, rights of way, haven't you?

A. Yes, that is correct.

Q. However, I believe you have already testified that you took the original cost there instead of the amount of funds it would be necessary to secure that property today?

A. In a broad sense, yes.

Q. What is it?

A. I took the amount they paid for the rights of way plus damages.

Q. Plus damages?

A. Yes.

Q. Why did you do that?

A. Because I considered that the damages paid to the farmers were just as much a part of the right of way as anything else. The damages have little relation to the fact but are more concerned with the trading ability of the farmer.

Q. My question was directed to why did you take the original cost rather than the reproduction costs new?

A. Why—

Q. The same answer you gave in regard to the other?

A. Yes. I explained it two or three times.

Q. I will ask you if you made any effort to ascertain the reproduction costs new of these land rights of way?

A. No. As I explained it before, the price paid is the best evidence of the cost of reproduction.

Q. All right.

Let's have the working papers pulled out here on the land. I think it is in an envelope labeled "Land and Land Rights." What page is your breakdown here of land rights in this exhibit on?

A. Land rights or rights of way begins on Page 41.

Q. I am interested in the land account 352-2.

A. That is where it begins, on Page 41.

Q. And—2, both?

A. Yes.

Q. Do you have the working papers on that?

A. I think so. I have 351-1 here.

Q. I hand you your working papers and I will ask you to identify a letter, stating from whom it was written and to whom that letter was addressed.

A. This is a letter from the Clayton Abstract Company, Inc. to Ford, Bacon & Davis, Inc., 39 Broadway, New York City.

Q. The date of the letter is what?

A. October 17, 1939.

Q. Will you read the letter, please, Mr. Rhodes?

A. This is a letter addressed to Ford, Bacon & Davis, Inc., 39 Broadway, New York City, relative to the Colorado Interstate Gas Company's Clayton compressor station site and the Certificate of Appraisal. It reads:

"Agreeable to your assignment we have reviewed the following described real estate, viz:

> "The North half of the Northwest quarter of the Northwest quarter ($N\frac{1}{2}NW\frac{1}{4}NW\frac{1}{4}$) of Section eleven (11), and the Southwest quarter of the Southwest quarter ($SW\frac{1}{4}SW\frac{1}{4}$), of Section two (2), in Township Twenty-six (26) North, Range Thirty-six (36), East, N.M.P. Meridian, (60 acres)

and estimate the aggregate value of the same, at existing market, to be Six Hundred and Ninety ($690.00) Dollars.

"This appraisal is of the land only, as it now exists, ignoring buildings or other structures of any nature thereon, but giving consideration to existing adjacent highways, general topography and accessibility. The valuation given is our estimate thereof as of December 31, 1938, and at the present time no change in value occurring during the interim.

"In making this appraisal no survey of the premises or search of the title has been made. It is assumed that the title is good, that the description as recorded is a proper description of the legal boundary lines and that no restrictions have been violated; that the property is free and clear of liens and/or encumbrances.

"No consideration has been given to the shrubbery, landscaping, or other improvements, sewer, water system, or other installations, upon or under the surface of said lands, incident to or used in connection with, the operation of said compressor station.

"CLAYTON ABSTRACT COMPANY, Secretary."

I can't read the man's name but it is signed as "Secretary."

Q. I thought you just got through telling me you had made no effort to ascertain the reproduction costs new of this property.

A. You were asking me with respect to the rights of way. Furthermore, I stated that I considered the actual cost of this property in the aggregate to be a better measure of value than any other.

Q. So you do want to modify your answer to admit that you made some efforts to ascertain the market value of the property, what it cost you to get the property?

A. Personally I didn't. I reached the conclusion myself, being familiar with the territory, that cost was a better measure of value.

Q. This letter wasn't written pursuant to your instructions?

A. No. My recollection is that these letters were written in accordance with a common practice in our organization to find out what the prices of property are—what they are currently assigned to the property.

Q. I want you to turn to the item listed at $690 under date of December 31, 1938 and I want you to turn to the item in your breakdown and tell us what value you have assigned to the property in your report here.

A. That property was valued at $1740, its cost.

Q. Are there any more instances where your company tried to find out the appraised value of this property?

A. I don't know. You have seen the working papers and I never saw that letter before.

Q. You didn't even consider these working papers?

A. I haven't seen the working papers on this job for some time and I have paid no attention to any letters of appraisal because I considered that no appraisers, even the Clayton Abstract Company, Inc. in Clayton, could tell about

a site located ten miles from a city surrounded by open prairies.

Q. Why did your firm ask for the information?

A. I have already explained that we get those appraisals as a matter of routine.

(Vol. XIII, pp. 1781-1805.)

* * * * * *

Q. Let's see how much you have this communication equipment depreciated. You have it depreciated 16 per cent, don't you?

A. That is right.

Q. All right.

You have likewise in your other report gotten it depreciated in regard to Canadian River as 16 per cent, is that right?

A. That is right.

Q. I believe that is the only place where the depreciation on both of the properties is the same, is that right?

A. Yes.

(Vol. XIII, p. 1845.)

* * * * * *

Q. Of course, I asked you about the purchasing power of the dollar, not the price of pipe, but I will ask you to tell me the difference between the purchasing power of the dollar and the price of pipe.

A. One expressed in percentage is the reciprocal of the other.

Q. Was there any 22-inch pipe in 1910 that was used by gas companies?

A. Very little. 22-inch pipe didn't come into common use until about the mid '20s.

Q. Now, I have just a few more questions here in regard to Page 29.

The cost of assembling the funds required for construction of the properties represents the difference between the amount of money paid by the initial investors for the securities and the amount available to the new company to meet the requirements of its construction program. I will ask this question:

In making this study, did you at all consider what the cost of financing was to the Public Service Company of Colorado?

A. No.

Q. Do you know that their cost of financing instead of being 4 per cent was—the cost of refinancing was 2.92 per cent and 2.40 per cent?

A. No.

Q. Do you know that in 1939 the cost of financing the Panhandle Eastern Pipe Line Company instead of being 4 per cent as you have it here was 2.61 per cent?

A. I think you are asking me questions as to things which are not so. You are reading from one of the Securities and Exchange Commission reports to which I had referred, which gives the cost of financing of certain parts of the financial structure of the company and not the whole cost of financing for all of the money required to build the properties.

Q. In other words, these are refunding costs—cost of refunding issues and not the cost of financing a new property?

A. What I had primarily in mind is that they do not cover all of the financial structures and all of the securities of the company; only a part of them, the underlying securities, security issues that are mostly bonds. In many cases they are very much the underlying bonds.

Q. This list that was being read from was the refunding of bond issues?

A. Yes, as I say—

Q. The cost of the refinancing of the refunding of the bond issues?

A. The cost of the refinancing of the refunding of the bond issues is not the cost of financing a whole property. It is only the part of it that is the easiest to finance.

(Vol. XIV, pp. 1871-1873.)

* * * * *

Q. In order to compute the cost of financing, what information would you have to have before you?

A. The Commission's statement as to the price of offering to the public or the price at which they were sold to the public, and also the statement as to the net yield to

the company. The Securities and Exchange Commission in its report shows both of those figures and also shows the price to the underwriter.

Q. That is all the information you would have to have before you in order to compute your cost of financing?

A. With respect to any issue, yes.

Q. All right.

I direct your attention to the Securities and Exchange publication for the Public Utilities Division secured issues of electric and gas utilities, from 1935 to 1939. Now, I direct your attention here to the Public Service Company, of Colorado where it is listed.

It is first mortgage three and one-half per cent, 1964; bond issue, $40,000,000, November 28—just a minute. Let me get my tracer so that I can trace it through more accurately.

$40,000,000, November 28, 1939; price to underwriter, amount 100; per cent, 3.50. Net cost to company, 99.12 per cent. Per cent cost, 3.55 per cent. Price to public, amount 102; yield, 3.38 per cent.

Now, I understand that is all of the information you would have to have before you in order to compute the cost of financing of these bonds?

A. Of that issue, yes.

Q. All right, Let us see you do it.

A. Well, the price to the public is 102 even. The net price to the company was 99.11. The spread between the price to the public and the net price to the company is 2.89 per cent—2.89. To get that into the cost of financing you divide that by .9911 which would bring it up to a little over three per cent.

Q. 3.0 per cent?

A. I haven't calculated it.

Q. It is 3.01 per cent?

A. Now, I was making a short-cut, and an approximation there that was wrong. My approximation was wrong. It is about 2.92 per cent. That was the cost of financing of that $40,000,000 issue.

Q. Is there anything here you didn't have before you

when you were computing the cost of financing this new company in so far as bonds were concerned?

A. As I told you, I took a 4 per cent figure which is lower than the average cost of all financing. I didn't compute it specifically.

Q. Now we will take another one of these gas companies—

A. The Public Service Company of Colorado, by the way, is only in a small measure a gas company.

Q. Oh, yes.

A. It is an electric company.

Q. Yes, that is right, but in your nine billion dollars there is not only included gas companies but it includes everything from electric utilities to companies engaged in the canning business, isn't that right?

A. That is true, but you are referring to a very large issue of that group of industries which enjoys a very low cost of financing, and furthermore, you are referring to underlying bonds rather than the whole property.

Q. All right. Take one company. Would you say the Northern Natural Gas Company was engaged in a similar business to this business here of the Colorado Interstate Gas Company?

A. Yes, quite similar.

Q. All right.

I refer you—

Mr. Campbell: Mr. Examiner, I wonder if the Examiner and Mr. March would object to a question from us from time to time here to avoid a misunderstanding?

Mr. March: Feel free to do so when—just as soon as I get through with this you can ask any question you want to.

Mr. Campbell: I don't want to interrupt you, Mr. March.

Mr. March: Feel free to ask questions.

Mr. Campbell: I would like to ask, before you leave the Public Service Company of Colorado, whether you know they also have in addition to the bond issue refunded a large issue of preferred stock and a very large issue of common stock?

Mr. March: Refinanced?

Mr. Campbell: That would have to be refinanced if you refinanced the Colorado Public Service Company.

Mr. March: I haven't made any study at all of the corporate structure of the Public Service of Colorado.

Mr. Campbell: That is a fact.

Mr. March: If he wants to testify, we would be glad to put him on the stand.

Q. I refer you to Page 7 of the same report which has the Northern Natural Gas Company bond issue, first mortgage, and first lien series A, 3-½ per cent, 1954, principal amount, $16,000,000; approximate date of offering, August 15, 1939; net price to company, 98.84 per cent; cost 3.35; cost to the public, amount 100; yield, 3.25 per cent. Can you compute the cost of financing of that issue?

A. Well, the price to the public was 100; the net yield to the company was 98.84. The spread is 1.16, and the cost of financing of that issue subject to a note that we must investigate, is the apparent cost of financing, is about 1.18 per cent. There is a Note P, however, mentioned in the price to underwriters: "Private sales to insurance companies and others, market prices are indicated where same security is outstanding with the public."

That is not a public offering in the sense that they have to have the same kind of a spread that is involved in the ordinary case.

Q. Well, we'll take the Oklahoma Natural Gas Company. The Oklahoma Natural Gas Company, I referred to you, is a bond issue, first mortgage, Series B, 3-¾ per cent, 1955; principal amount, $17,000,000, August 17, 1939, approximate date of offering; price to underwriters, 101—amount, 101.50; cost per cent, 3.63 per cent; net price to company, amount 100.88.

Cost per cent, 3.68; price to public, 103.50; yield per cent, 3.46 per cent.

A. Well, the spread between the price received by the company and the price to the public was 2.62. Dividing

that by the 100.88, the figure received by the company, gives approximately 2.6 per cent as the cost of financing of that issue.

Q. Now, how much bonds would you have to float in order to finance this proposed new Colorado Interstate Gas Company?

A. I haven't figured it out.

Q. Well, when you secure funds, you usually secure most of the funds by bond issues?

A. Well, there is a very conceivable combination of bonds —preferred stock and common stock has been used in the financing of companies.

Q. Yes.

A. —and it would be necessary to go to the investment bankers to find out what should be the corporate structure of such a property to get the lowest cost of money.

Q. You wouldn't know yourself, of course, what the corporate structure would be?

A. No, that would depend on negotiations entered into at the time.

Q. What is usually the corporate structure of one of these independent companies?

A. There isn't anything usual about it. The tendency is to finance pretty generally with bonds and preferred stock and have the common stock reflect the earning power over and above the coupon rates, but what would be done today I don't know.

Q. When the Colorado Interstate Gas Company was organized, do you know how much bonds—originally organized, do you know how much bonds it was necessary for it to issue?

A. I don't recall.

Q. You didn't give that any consideration?

A. No.

Q. This hypothetical new company would construct a property very similar to the one originally constructed by the original Colorado Interstate Gas Company, wouldn't it?

A. On reproduction of the property, yes.

Q. On Page 26, is bond discount included in the per cent here?

A. No, bond discount is the difference between the price received by the company and the par value, or face value

of the bonds. It has none but an indirect relation to the cost of financing.

Q. How do you know that to be so?

A. It is a necessary result. The cost of financing is the difference between the price received by the company and the price at which the security is issued to the public. The company might receive a hundred and one for the bonds and the public pay a hundred and five and there would be a premium on the bonds, or the public might receive—I mean the company might receive a hundred and it would be offered at one hundred five and there wouldn't be any bond discount, but on the other hand the company might get ninety and be sold to the public for ninety-five; then there would be a bond discount of ten points, whereas the cost of financing was only five points.

Q. You gave no consideration to that probability in regard to bond discounts?

A. That doesn't enter into the cost of financing except as the bankers may find the best combination of coupon rate and offering price to the public to result in the lowest cost of money.

(Vol. XIV, pp. 1876-1884.)

* * * * *

You have this office furniture and equipment in your Canadian River exhibit depreciated approximately 29 per cent and in your Colorado Interstate Gas Company exhibit you have it depreciated 20 per cent. Can you give me any reason why that difference?

A. None, except the opinion of the furniture expert who determined it for us.

Q. You had different furniture experts determine the Canadian River than Colorado Interstate, is that right?

A. Yes, and in each case it was a local man.

Q. You have made no check on these?

A. No, I haven't checked that.

Q. You don't know—you didn't know anything about the record of the use of this furniture in either properties?

A. No.

Q. Yet you did change the percentage, did you not?

A. If I recall correctly, I increased the percentage that was given by these men to make sure that it covered things they might have overlooked.

Q. Let's check and see if you did. Get his working papers out on that. Let's check on your Colorado Interstate first here.

A. Now, in Account 372, Office Furniture and Equipment, the percentage reported to me was 17 per cent depreciation.

Q. Colorado Interstate Gas Company?

A. That's right.

Q. Your sole reason for increasing it to 20 per cent was because you wanted it to be liberal?

A. I tried to make my depreciation allowances liberal, yes.

Q. Are there any other cases where you increase the percentage in any of the items here?

A. Which item?

Q. Depreciation items, account items.

A. Why, I followed that practice generally.

Q. You recall yesterday we found one case where you had decreased the percentage.

A. No, as I explained, I had misinterpreted my notes and I was comparing poles with poles, plus some of the fixtures where some of the fixtures weren't as much depreciated. I explained that already, but I know it was in the final overall figure for the account I did adjust upwards in depreciation.

Q. Did you increase the pipe, too, on this?

A. Yes, the figure found for the pipe by usual methods was 3 per cent depreciated which was what the field observations clearly indicated. I increased it to 5 per cent.

Q. Do you recall whether you did the same thing with regard to the Canadian River or not?

A. Yes, that was increased from 5 to 7.

Q. So all of the men who actually examined the property were wrong to approximately, on an average, of 2 per cent?

A. No, I won't say they are wrong. All I say is that I wanted to include in this reproduction costs new less depreciation an ample allowance for all of the depreciation that existed in the property.

Q. Well, in other words, if the men who gave you the report that the pipe was only depreciated approximately 3 per cent and you said it was depreciated 5 per cent—2

percent more—then, who do you think is right, you or the men who actually observed it?

A. Well, we're both right. I tried to give an outside figure. They reported on what they found. You don't see everything when you inspect a property. There are things that are hidden that you can't see without an undue amount of expense, and I have made it a practice to increase the observed amount of depreciation to reflect those things which escape the men in the field.

Q. So you would say, then, that on the average you would increase—if you had used the figures reported to you, you would have increased each accumulated depreciation item approximately 2 per cent?

A. Why, I don't know. I haven't thought of it that way. I have taken item by item and considered the nature of the inspections and made an adjustment to reflect those things which I think may well have escaped the men making the observation.

Q. What could have escaped them that you gave consideration to?

A. Well, if I knew specifically, why it would have been reported by them.

Q. What did you know about the depreciation of the pipe which the men actually making the examination didn't know.

A. The men that made the examination did nothing but measure the depth of the pits and record facts. Those facts were analyzed with the indication that the amount of depreciation was 3 per cent. If they—

Q. You—

A. Now, let me finish.

Q. Yes. Pardon me.

A. —instead of measuring the number of sections of pipe they did measure, they spent twice as much money and examined twice as many places, the figures as to pit depths that they obtained would be somewhat more dependable. There would be less chance for their having missed some depreciation. That's one of the things, but my prime consideration in determining the percentage of depreciation in here was to have it big enough—in other words, to show the most that I thought could be found in the property.

Q. How long would you say this pipe line would last if it has been running since 1928 and has only depreciated 5 per cent?

A. I couldn't quite hear you because you had your hand over your mouth. Did the reporter get it?

Mr. March: Read it.

(The question referred to was read by the reporter, as set forth above.)

The Witness: Why, the pipe line will last just as long as the company wants to keep it up.

By Mr. March:

Q. At the rate the company is keeping it up now, how many years would you say it would last?

A. Well, now, that depends on what you mean by the rate at which the company is keeping it up now. The company is keeping it up, replacing everything that needs to be replaced as fast as it needs to be replaced and if they continue in that policy which is the rate of maintenance or repair, or what you want to call it, the pipe line will last just as long as they keep up that practice.

Q. Did you give any consideration in determining the depreciation of this pipe to the replacements which the company has been forced to make since 1928?

A. They are relatively negligible.

Q. Did you give any consideration to them?

A. No. Anything that they may have done would be reflected in this overall result, however, subject to—as I pointed out before, the effect of the number of points of inspection.

Q. You didn't consider whether or not certain portions of the line had to be replaced or the actual replacements?

A. This figure takes into account what is there now, but it also takes into account the fact that some parts of the pipe will unquestionably have to be replaced before other parts of the pipe and that some parts of the pipe may last a very very long period of years.

Q. How long would this pipe line have to operate before it would be necessary to have replaced—would have been necessary to have replaced all of the pipe?

A. Why, I don't know, but several hundred years, probably.

Mr. March: That's all for the present.

Mr. Campbell: I have some redirect, if the Examiner please.

Redirect Examination.

By Mr. Campbell:

Q. Mr. Rhodes, Commission's counsel on cross examination handed you a publication of the Utilities Division of the Securities and Exchange Commission entitled "Security Issues of Electric and Gas Utilities, 1935, '36, '37, '38 and '39." Is that correct?

A. Yes.

Q. He asked you certain questions about the following companies listed in that document: "Public Service Company of Colorado;" is that correct?

A. That's correct.

Q. He had reference particularly to a $40,000,000 bond issue that was refinanced, is that correct?

A. Yes.

Q. Do you know whether that company has in addition to that capital security, common stock?

A. Yes, but how much I don't know.

Q. Do you know whether they have preferred stock?

A. I so understand, but I do not know how much.

Q. Do you know whether they have other bonds than that issue?

A. I do not know.

Q. Then you wouldn't be prepared to state that that $40,000,000 bond issue represented all of their capitalization?

A. I'm sure that it would not.

Q. He also asked you about the Panhandle Eastern Pipe Line Company, and particularly to a 4 percent bond issue. Do you know whether that 4 per cent bond issue represents all their capitalization?

A. What is the size? I have forgotten—$24,000,000 couldn't possibly represent all of the financing of that property.

Q. Will you examine this same document that we are

talking about, under the description here, and state for the record the nature of those bonds?

A. Panhandle Eastern Pipe Line Company, first mortgage and first lien, 1952.

Q. You are not prepared to say then, whether that bond issue represents all of their capitalization?

A. I'm sure it does not because $24,000,000 couldn't possibly finance the whole of the cost.

Q. Didn't he ask you about Northern Natural Gas Company bond issue—and I ask you to—pardon me. I will ask you to refer to that same document and read the description of that particular issue.

A. Northern Natural Gas Company, Notes 2-⅛ per cent, 1940 to 1946.

Q. The amount of them?

A. $6,000,000.

Q. Do you know whether that $6,000,000 represents all of their capitalization?

A. It does not.

Q. He also referred to Oklahoma Natural Gas Company bonds of a certain description. Now, I refer you to this same document and ask you to read from that document a description of 22,200 shares of 6 per cent prior preferred stock.

A. Well, that was prior preferred stock convertible, 6. per cent, $100 par.

Q. What was the price of that stock to the underwriters, as it is listed in this document?

A. The price to the underwriters was 96 even.

Q. And the cost in percentage to the underwriters?

A. 6.25.

Q. Now, what is shown in this document under the column "Net Price to Company"?

A. Note—

Q. Will you read that note?

A. "Offered for the account of others."

Q. And price to the public in that document is shown to be what?

A. 100.

Q. And the yield to the public?

A. 6 per cent.

Q. I want you to make a similar calculation as to the cost of financing that issue.

A. Well, the cost of financing that issue in the sense of the cost to the company is not determinable. These notes—I mean this stock offered to the public was not sold for the account of the company but for the account of some other owner and the price received by the owner of the stock is not disclosed but the bankers' spread from 96 to 100 is four points, making that rather over four per cent in terms of the price paid by the underwriters. That, however, is not all of the cost of financing.

Q. Now, referring to this same document, I refer you to another issue of Oklahoma Natural Gas Company, 5-1/2 preferred stock. Will you read the descriptive text on that particular issue from that document?

A. This is Oklahoma Natural Gas Company, cumulative prior preferred stock, convertible, $5.50, no par.

Q. Will you continue reading the other descriptive matter as to the price to the underwriters and the net price?

A. The price to the underwriters was 101 even. The net price to the company was 100.48 and the price to the public was 104. The cost of financing was the difference between 100.48 and 104, a little over three and a half—about three and a half per cent is the cost of financing that particular issue of 2,200 shares—no, 58,000 shares.

Q. I hand you this same document and I will ask you to read a description of the New Mexico Gas Company 5 per cent bonds as therein reported.

A. This is the New Mexico Gas Company, first mortgage convertible, Series A, 5 per cent, due 1951—there is a note which I will refer to later—the par value of it being $1,500,000. The price to the underwriters was 94. There is a Note L that indicates that they were offered not for the account of the company but for the account of others, so we don't know what the company received.

The offering price to the public was 99, the bankers' spread being 5 points. The whole cost of financing is not determinable.

Mr. March: You say that is not determinable?

The Witness: Not in that because it was not offered for the account of the company.

By Mr. Campbell:

Q. But you did state the bankers' spread?

A. That is right.

Q. I will ask you to refer to that same document and read the description with respect to this same company; that is, the New Mexico Gas Company issue of 6 per cent preferred stock.

A. The New Mexico Gas Company cumulative preferred stock, convertible 6 per cent, $50 par, 8,000 shares. The price to the underwriters was 40.

Q. State the par value of it.

A. $50.

Q. Is that shown in that document?

A. That is shown in that document.

Q. Proceed.

A. The price to the underwriter was $50—no, $40, and the net price to the company was the same.

Q. For the record, convert the par and offering price to one hundredths or percentage thereof.

A. On the basis of 100 points, the price to the underwriter was 80 and the net price to the company was 80.

Q. Proceed.

A. The price paid to the public in terms of the $50 par was 45 and in terms of 100 points was 90, the cost of financing in that case being the difference between 80 and 90 or 10 points. The cost of financing is 10 points divided by the 80 received by the company which makes it 12-½ per cent for the cost of financing.

Q. You stated there, I believe inadvertently, that the cost paid to the public—

A. The price to the public, offered to the public.

(Vol. XIV, pp. 1889-1896.)

* * * * * *

Q. I refer you to that same document we have been discussing and I will ask you to read the description of an issue of the company, the Kansas Pipe Line & Gas Company, 5 per cent bonds due in 1952.

A. This issue of the Kansas Pipe Line & Gas Company, first mortgage sinking funds, 5's due in 1952, is in the amount of $1,000,000. The approximate offering date was March 19, 1937. The price to the underwriter was 95; net price to the company, 93.86; the price to the public was 100.

Q. Approximately what would be the cost of financing there calculated according to the rule or principle that you have already here described?

A. About 6 6/10 per cent.

Mr. March: Just a minute. Will you state the date here?

The Witness: I did read it.

Mr. March: I didn't hear it. Please read it again.

The Witness: March 19, 1937.

By Mr. Campbell:

Q. Referring to that same document, I will ask you to describe the issue of the Kansas Pipe Line and Gas Company common stock.

A. The Kansas Pipe Line & Gas Company common stock, $5 par value, number of shares, 110,000; approximate offering date, August 27, 1936; the price to the underwriters, 4.82 as compared with the $5 par. The price to the company was 4.73 and the offering price to the public was $5.

Q. Now will you compute the cost of financing that issue in accordance with the principle that you have described here?

A. That was 5 8/10 per cent.

(Vol. XIV, pp. 1899-1900.)

* * * * *

Q. Will you refer to that same document and describe the El Paso Natural Gas Company's issue of 4½ per cent bonds?

A. The El Paso Natural Gas Company, first mortgage 4½ due 1951, seven and a half million dollars, approximate date of offering June 4, 1936; price to underwriters, 95.50; the net price to the company, 94.14, and the price to the public, 98.50.

Q. Tell us what the cost of financing that issue was in accordance with the rule that you have described here.

A. Well, the total spread between the net price to the company and the price to the public is the difference between 94.14 and 98.50 which is 4.36. That, based on the net price to the company, shows a cost of financing of about 4.63 per cent.

Q. Referring to that same document, will you read the description as to the El Paso Natural Gas Company 4¾ bonds?

A. These are El Paso Natural Gas Company convertible debentures, 4¾ per cent, due 1946, and in the sum of $3,750,000; approximate date of offering, June 4, 1936; price to the underwriters, 96.5; net price to the company, 95.16; price to the public, 100.

Q. Will you calculate the cost of financing that issue in accordance with the rule you have here stated?

A. The spread between the price to the public and the net price to the company is 4.84 per cent. This divided by the percentage yield to the company of 95.16 shows a cost of financing of 5.08.

Q. And referring to that same document I will ask you to read the similar description with respect to the El Paso Natural Gas Company's common stock.

A. The El Paso Natural Gas Company's common stock is at a $3 par. There was 60,000 shares offered on approximately September 10, 1936. The price to the underwriters was 19. The stock was offered for the account of somebody else other than the company and the price to the public was 20. We do not know there the cost of financing. All we know is the bankers' spread.

Q. Now, I believe you have already testified on your direct testimony that you and your subordinates accumulated all of the available data from the Securities and Exchange Commission and that that data included not only the gas companies but electric companies, and in fact, all types of industry, is that correct?

A. I accumulated all the data I could find up to and including 1938.

Q. And you arrived at your figure of 4.35 per cent on the basis of all of the issues so reported by the Securities and Exchange Commission?

A. That is true.

Q. Now, from your examination of those documents, did you discover whether or not those issues included not only bonds but preferred and common stock?

A. They did.

Q. In determining your reproduction costs new you assumed a new and independent company, is that correct?

A. That is right.

Q. I will ask you from your experience in the natural

gas business which you have already testified to here at great length about, as to whether or not it would be reasonable to expect that such a company could go and borrow from the public 100 per cent of the cost of the project?

A. I don't think it could.

Q. Could you borrow 100 per cent of the cost of building a house for yourself?

A. No.

Q. Do you, therefore, assume that a company would have to finance part of the cost of the project with a common stock issue?

A. I am sure it would.

(Vol. XIV, pp. 1901-1903.)

* * * * *

Q. Then I will ask you this question: Your reproduction costs new are not based on any assumption as to who would be the contractor if there was a contractor?

A. That is correct. I made no assumption as to who would do it except that the company owning it would be an independent operation.

Mr. March: Just one question here.

Recross Examination.

By Mr. March:

Q. Mr. Rhodes, I hand you a document that I examined as a part of your working papers. I will ask you if that is correct?

A. I believe this is some of the prices requests and applies to the Hope Natural Gas Company work which was shown to you at your request.

Q. Which you utilized for some of those quotations of this reproduction costs new exhibit?

A. We used them for the purpose of checking those we used in the exhibits.

Q. You didn't use any of these?

A. Well, they are identical. I wouldn't be willing to say whether I used these or those. We calculated it from the list price discounts. They were identical anyway.

Q. As to the work considered, I refer you to this letter in your working papers. Will you state to whom and from whom this is addressed?

A. This is a letter from the Jones & Laughlin Steel Corporation to the Hope Natural Gas Company.

Q. The date of the letter is what?

A. May 3, 1939.

Q. Will you read the last sentence in the second paragraph?

A. It states: "Our sales are made only at delivered prices; therefore, these basing point prices are to be construed as submitted only for estimating purposes."

Q. Whose handwriting is on that letter?

A. One of my men's handwriting. I don't know which one it is. I don't recognize it specifically, but the note says "Jones & Laughlin prices reflect ten per cent discount on large quantities but do not reflect ten per cent on small quantities, but do not reflect two per cent cash discount."

Q. The quotations of Republic Steel and Jones & Laughlin Steel Corporation, did they differ very much?

A. It just depends upon if you apply all of the discounts. Some of the people give you all of the discounts, including the ten per cent for bulk purchases, and some of them don't. Until you find out what they include and compare them, they mean nothing. Spang Chalfant gave the ten per cent bulk discount to the large items but not the small—I mean Jones & Laughlin Steel Corporation.

Mr. Brock: Instead of Spang?

The Witness: Yes.

Commonly in getting the prices they do not apply the ten per cent bulk discount.

(Vol. XV, pp. 2098-2100.)

* * * * *

A. Well, we have an estimate here for Colorado. If I recall correctly, five per cent covers all those delays.

Q. Now, I believe originally Mr. Hill, when he estimated cost of constructing this line to Denver, over estimated the cost of the line because he had been used to constructing lines down in the rainy parts of Louisiana, is that correct?

A. That is an assumption on your part that that was the cause of it. I asked him what was the cause of it and he said, "Well, I just went over the line and I put a figure down to have in mind when I was comparing the bids."

He made no detailed estimate.

NOTES:

Columns 1, 2 and 3 are from Exhibit 231 (and are taken from Respondents' Exhibits 68 and 70).

Column 4 is from National Tube Company General Catalogue, 1938 edition, page 189. (Same data are given in Youngstown Sheet and Tube Company Booklet No. 51, 1937, page 55.)

Column 5 is product of columns 2 and 3.

Column 6 is from Exhibit 231.

Columns 7 and 8 are from same source as column 4. Column 7 is weight per foot of regularly manufactured Grade "B" Seamless and Electric Weld pipe with working pressure equal to that of lapweld pipe installed in Denver Main Line, or in excess of 400 pounds per square inch.

Column 9 is product of columns 2 and 7.

Column 10 is product of column 9 and average cost of pipe delivered as shown in Exhibit 231. (Delivered price of pipe in Exhibit 231 is as follows: To Canadian River Gas Company, 22" pipe, $63.90 per ton; to Colorado Interstate Gas Company, 20" and 22" pipe, $66.56 per ton.)

Total cost of pipe delivered, shown in columns 6 and 10, excludes state sales taxes and "undistributed construction costs".

45 Data [illegible] pipe used in welded or [illegible] lines

[Testimony of Witness Hill.]

Q. Mr. Hill, I will ask you whether or not you have had occasion to examine Exhibit Nos. 68, 70 and 71 that have heretofore been presented in these proceedings?

A. Yes, sir.

Q. Have you also had occasion to make a study of the pipe prices and Dresser couplings?

A. Yes, sir.

Q. Have you made a comparison of pipe prices and Dresser couplings as you found them in—strike "In"—with those as presented in those exhibits, Exhibits Nos. 68, 70 and 71?

A. Yes.

Q. Is this the exhibit and written statement that you prepared in connection with that study?

A. Yes, sir.

The Trial Examiner: It will be marked for identification as Exhibit No. 231.

(Exhibit 231, Witness Hill, marked for identification.)

By Mr. Lange:

Q. Will you please read that written statement, Mr. Hill?

A. "Rebuttal Testimony re Exhibits 68, 70 and 71.

"Respondents' exhibits 68 and 70 present estimates of the reproduction cost new of the Denver pipe line properties of Canadian River Gas Company and Colorado Interstate Gas Company as of December 31, 1938.

"Pipe Costs

"Testimony concerning Account 353, Mains, and an examination of supporting working papers show that the prices of line pipe used in these exhibits are based on published prices and discounts as of December 31, 1938, with an additional deduction of ten per cent of the net discounted price as an allowance obtainable on large volume purchases.

"The records of Canadian River Gas Company and Colorado Interstate Gas Company (which are substantially in agreement with pipe quantities given in Exhibits 68 and 70) indicate that approximately 81,000 tons of line pipe were used in the construction of the Denver pipe line from Bivins Station to Denver including branch lines to intervening points.

"During 1938, 1939, and 1940, major pipe line projects were constructed by a number of companies. Some of these companies have submitted to the Commission, upon request, complete data concerning the amount of pipe purchased and prices paid therefor. Copies of purchase orders and invoices for steel line pipe purchased for major construction during the period from December 1938 to September 1940 were furnished by Panhandle Eastern Pipe Line Company, Northern Natural Gas Company, United Gas Pipe Line Company, and El Paso Natural Gas Company; and a sworn statement of transmission line costs was filed by Louisiana Nevada Transit Company. In addition, a statement of pipe purchased by Canadian River Gas Company and Colorado Interstate Gas Company during this same period was prepared from their records.

"The information furnished by the seven companies covered the purchase of over 900 miles of gas line pipe, ranging in diameter from 3½ inches to 24 inches, with a total weight of over 90,000 tons, at a cost in excess of $4,000,000. Practically all of this was double random length pipe, averaging 38 to 43 feet per joint. A considerable part of this pipe was 'Grade B seamless,' for which published prices are higher than for the 'Grade A lapweld' pipe used in the construction of practically all of the Denver line.

"The information submitted by the seven companies has been analyzed, the pipe purchases have been grouped into two classifications:

"1. Pipe with a diameter of 10¾" O.D. to 24" O.D.

"2. Pipe with a diameter of 8⅝" O.D. and under.

"This classification is based on the fact that United Gas Pipe Line Company purchased approximately 19,000 tons of pipe, in sizes varying from 10¾" O.D. to 22" O.D., at a single price of $43 per ton f.o.b. mill, at the time it built its Monroe-Jackson line; and that Louisiana Nevada Transit Company purchased all of the pipe used in the construction of its line from the Cotton Valley field in Louisiana to Okay, Arkansas (amounting to approximately 4,000 tons of 4½", 6⅝" and 8⅝" pipe) at a price of $50 per ton f.o.b. mill.

"The weighted average price of approximately 80,000 tons of line pipe of the first classification (10¾" O.D. to 24"

O.D.) purchased by the seven companies is $44.25 per ton f.o.b. mill. The weighted average price of approximately 13,000 tons of line pipe of the second classification (8⅝" O.D. and under) purchased by the same companies is $49.24 per ton f.o.b. mill. The prices paid on individual purchases vary from a minimum of $42.23 per ton f.o.b. mill paid by Northern Natural Gas Company, in the purchase of 315,836 feet of 16" O.D. pipe, to a maximum of $65.78 per ton f.o.b. mill paid by Colorado Interstate Gas Company, in the purchase of 265 feet of 22" O.D. pipe. The maximum price relates to a small purchase where published prices prevail, and the minimum to a large volume purchase based on negotiation. The weighted average prices reflect purchases in both small and large amounts, but are influenced primarily by the large volume purchases.

"Exhibit No. 231 compares the cost of the line pipe in Account 353, Mains, as of December 31, 1938, as shown in Exhibits 68 and 70, and the cost of line pipe based on the weighted average prices determined from actual purchase orders of the seven companies previously mentioned. For the purpose of comparison, the basic *cata* employed in the preparation of Exhibits 68 and 70, except as to the price of pipe, have been used in caculating the pipe cost shown in Exhibit No. 231. In this exhibit, state sales taxes have been omitted from the costs of pipe based on actual prices paid by the seven companies, and also from the costs taken from Exhibits 68 and 70.

"Dresser Coupling Costs

"The 22" and 20" transmission line from Bivins station to Denver, the 16" C.F.&I.-Pueblo lateral, and the 10¾" lateral to Arapahoe measuring station are Dresser coupled lines, which are built with single random length pipe averaging 19 feet per joint. Practically all of the pipe purchased between December 1938 and September 1940 by the seven companies whose pipe purchases were analyzed was double randon lengths, averaging between 38 feet and 43 feet per joint. If the Denver line were reconstructed, double random lengths would be used in accordance with present day practice, and the number of Style 38 Dresser couplings would be but 45 to 50 per cent of the number actually installed. In this exhibit, the higher percentage

has been used, and applied to the cost of Style 38 Dresser couplings shown in Exhibits 68 and 70; this results in a reproduction cost equal to half that shown in respondents' exhibits.

"Summary of Costs

"The reproduction costs of line pipe and Style 38 Dresser couplings required for the Denver line as of December 31, 1938 (excluding state sales taxes and 'undistributed construction costs'), as shown by Exhibits 68 and 70 and Exhibit No. 231, are as follows:

"Canadian River Gas Company

Line	Description	Line Pipe	Dresser Couplings	Total
	(1)	(2)	(3)	(4)
1.	Respondent's Exhibit No. 68	$1,535,978	$256,200	$1,792,178
2.	F.P.C. Exhibit 231	1,237,052	128,100	1,365,152
3.	Difference	298,926	128,100	427,026
4.	Percent difference	24.2	50.0	31.3"

Q. And for explanatory purposes you may state that the dollar figures in Line 2 are taken from Statement 1 of this Exhibit, isn't that correct?

A. Yes.

"Colorado Interstate Gas Company

Line	Description	Line Pipe	Dresser Couplings	Total
	(1)	(2)	(3)	(4)
5.	Respondent's Exhibit 70	$4,986,544	$717,448	$5,703,992
6.	F.P.C. Exhibit 231	4,120,934	358,724	4,479,658
7.	Difference	865,610	358,724	1,224,334
8.	Percent difference	21.0	50.0	27.3"

Q. And the dollar figures appearing in Line 6, I take it, are taken from Statement 2 of this exhibit?

A. That is correct.

Q. Proceed reading, please.

"Both Companies Combined

Line	Description	Line Pipe	Dresser Couplings	Total
	(1)	(2)	(3)	(4)
9.	Respondent's Exhibits 68 & 70	$6,522,522	$973,648	$7,496,170
10.	F.P.C. Exhibit 231	5,357,986	486,824	5,844,810
11.	Difference	1,164,536	486,824	1,651,360
12.	Percent difference	21.7	50.0	28.3"

Q. And the figures presented in Lines 9 and 10 are mere additions of those appearing under the two previous headings of the Canadian River Gas Company and the Colorado Interstate Gas Company on that same page?

A. That is correct.

"Exhibit 71, sponsored by respondents, presents estimates of reproduction cost new of the Denver pipe line properties of Canadian River Gas Company and Colorado Interstate Gas Company as of June 30, 1940. The unit costs used in Exhibits 68 and 70 in the preparation of reproduction cost estimates as of December 31, 1938 were also used in Exhibit 71 in the preparation of reproduction cost estimates as of June 30, 1940. Property in service on December 31, 1938 and on June 30, 1940, has been assigned the same reproduction costs in Exhibits 68, 70 and 71.

"Exhibit 71 shows that the changes in Account 353, Mains, between December 31, 1938 and June 30, 1940 were negligible. For Canadian River Gas Company the net change in the account was an increase of $356, or 0.02 per cent; for Colorado Interstate Gas Company the net change in Account 353 was a decrease of $6,320, or 0.08 per cent. It is evident that, for all practical purposes, differences shown in the preceding tabulation apply also to the reproduction cost of these properties, as of June 30, 1940, as shown in Exhibit 71."

(Vol. LXXVI, pp. 11249-11256.)

* * * * *

Q. Mr. Hill, referring to Exhibit No. 231-A that has just been identified, I will ask you whether this exhibit was prepared by you or under your direction and supervision.

A. It was, yes, sir.

Q. Will you give a brief explanation of it at this time?

A. Well, this is a substitution of seamless Grade B pipe for Grade A lapweld pipe used in Exhibits Nos. 68 and 70. It shows the footage taken from Exhibits Nos. 68 and 70 and the weights, the working pressure of lapweld pipe, and also shows the tonnage; also shows substitute weight of seamless pipe its working pressure, total tonnage and total cost of pipe delivered, and also the difference between the cost of the lapweld pipe and the seamless Grade B pipe.

Q. Does this exhibit reflect the difference in cost of lapweld pipe as computed by you?

A. Yes; that is, as compared with the seamless pipe.

Q. Is there any other matter in connection with that exhibit you desire to explain at this time?

A. I think the note at the bottom of this exhibit explains the way it was worked up and it also shows the difference between lapweld and Grade B seamless or electric weld pipe for both companies combined, Colorado Interstate Gas Company and Canadian River Gas Company.

Q. Now, referring to Exhibit No. 231, I will ask you whether or not the pipe prices that you had before you as a basis for that exhibit had reference to seamless and electric weld pipe?

A. Yes sir.

Q. As I understand it, this Exhibit 231-A relates only to the pipe in the main line.

A. That is correct.

Q. It doesn't relate to any pipe in the laterals?

A. That is correct,

Mr. Lange: I believe that is all for the present.

Cross Examination.

By Mr. Spencer:

Q. Mr. Hill, have you in your experience ever been in charge of the purchase of substantial quantities of pipe for a natural gas company?

A. I have bought a good deal of pipe. I have reviewed

quotations and purchases of pipe for large quantities of pipe.

Q. When was that, Mr. Hill?

A. Well, I bought a good deal of pipe when I was with the Sloss-Sheffield Steel & Iron Company.

Q. When was that?

A. From 1924 to 1929. I was with the Southern Natural Gas Company—

Q. Before we leave that, Mr. Hill, for what purpose was that pipe bought?

A. At that time we built about 12 miles of water lines, semi-mine properties, large-sized properties—

Q. What size of pipe was used?

A. If I remember right, offhand, it was about 14-inch pipe.

Q. What kind of pipe?

A. Steel pipe lapweld. Of course we use to buy lots of pipe for use around furnaces and byproduct plants.

Q. That covers the experience you have had in the purchase of pipe—

Mr. Lange: I think Mr. Hill was just about to add another matter when you asked him to include the other.

Mr. Spencer: I have that in mind, but there are a few questions about this particular experience that I want to ask him before he goes to the next one.

Q. That covers the experience in the purchase of pipe for about five years?

A. From 1924 to 1929, approximately five years.

Q. During that period, what was the largest single project for which you purchased pipe?

A. I think that 12 miles of water line was, the 12 or 14 miles of water line. I have forgotten exactly, but I think it was approximately that.

Q. All right, the next experience you had in the purchase of pipe was what?

A. In 1930 I reviewed a number of quotations for pipe purchased by the Southern Natural Gas Company, however, offhand I don't recall how much it was. It was a line from Benton Junction, Mississippi to Pensacola, Florida; and a line from Atlanta, Georgia to Milledgeville, Georgia.

Most of that pipe—I didn't actually purchase the pipe. I was just reviewing the quotations for the pipe. The purchasing agent purchased all of that pipe. Most of that pipe was 18 and 16 and 14 inch pipe and I think there was some 12-inch pipe from Mobile, into Pensacola. They purchased a line from the Southern Natural Gas Company main pipe line for Columbus, Georgia. It was 10 and 12-inch pipe.

I think it was 10, 12 and 8 on the Macon line.

Q. What period does that cover?

A. That was during 1930.

Q. 1930?

A. Yes, sir.

Q. You did not conduct the actual negotiations for the purchase of pipe for Southern Natural Gas Company?

A. I did not. I only made the tabulation on the pipe.

Q. The quotations were handed to you by the purchasing department?

A. Yes, we wrote the specifications and handed it to him and it was the uniform manner in which he got quotations.

Q. Do you know who actually did purchase the pipe at that time for Southern Natural Gas Company?

A. Bob Strickland was then purchasing agent. I am not sure whether he actually negotiated the pipe or Ingram actually negotiated the purchase of it. I am not sure about it as I don't know.

Q. Do you know what Ford, Bacon & Davis had to do with the purchase of that particular pipe?

A. Well, I don't know offhand. I know at that time Ford, Bacon & Davis had an operating contract over there and Mr. E. G. Hill was on the job at that time, but I don't know the particulars because I wasn't in on the negotiating of the pipe, that is, the actual purchasing of the pipe, and I don't recall the exact circumstances surrounding it, although Ford, Bacon & Davis did not do the construction work at that time.

Q. Did you actually purchase this pipe for the 12-mile water line that you testified about?

A. I was in the negotiations with the Chief Engineer, yes, sir.

Q. Who was actually responsible for the purchase of that pipe?

A. The purchasing agent, I imagine, if you want to know who actually purchased the pipe. The negotiations were carried on in our office and turned over to him. He always purchased everything under specifications from us.

Q. What other experience have you had in the purchase of pipe?

A. Well, I have purchased quantities of pipe for compressor stations for Southern. I have actually purchased the pipe myself—

Mr. Lange: You mean the Southern Natural Gas Company?

The Witness: Southern Natural Gas Company.

By Mr. Spencer:

Q. Small quantities of pipe?

A. Small quantities of pipe and fabricated pipe. It may have been a carload or something like that, including fabricated pipe.

Q. Now, referring to your written statement in Exhibit No. 231, you have made an examination in respect to Exhibits Nos. 68 and 70 presented by Mr. Rhodes?

A. Yes, sir.

Q. And from your statement here I conclude that Mr. Rhodes' prices of line pipe were based upon published prices and discounts as of December 31, 1938?

A. Yes, sir.

Q. In this Exhibit No. 231 you have a different approach to the matter of prices, is that correct?

Mr. Lange: You mean Exhibit 231-A?

Mr. Spencer. Exhibit No. 231.

The Witness: I don't understand that, Mr. Spencer.

Mr. Spencer: I will restate the question.

Q. In your Exhibit No. 231 you have not based prices on published prices and discounts?

A. No, sir, I have not. It has been based upon actual purchases of pipe bought over the period 1938 to 1940 by major pipe line companies.

Q. Now, where did you get your data and information on these purchases of pipe by what you term major pipe line companies during that period?

A. We received it from the pipe line companies themselves.

Q. I mean, where did you personally get it?

A. Well, it was sent to me from Washington.

Q. By whom?

Mr. Lange: The Federal Power Commission?

The Witness: To the Federal Power Commission, yes.

By Mr. Spencer:

Q. It was sent to you by the Federal Power Commission at Washington?

A. Yes.

Q. When did you receive it?

A. Well, I can give you pretty close to it.

Q. Approximately, Mr. Hill, is all that is necessary.

A. Well, I would say it was some time in either October or November. I am not certain.

Q. Of 1940?

A. Yes, 1940. I think it was sometime in October.

Q. Was it sent personally to you?

A. No, sir, it was not.

Q. It was sent to the engineering department of the regional office in Denver?

A. All of the mail goes through the regional director. It is a matter of form that is followed.

Q. Now, what instructions did you receive from the Washington office with respect to this particular data and information that they transmitted?

A. I didn't receive any information.

Q. Instructions?

A. No sir.

Q. None?

A. No, sir. My instructions are received out of this regional office, not out of Washington.

Q. Then for the purposes of this exhibit you have accepted information and data on pipe purchases which has been forwarded to you from the Washington office?

A. Yes.

Q. Now, in what form is that information and data set up with respect to these purchases that you use?

A. Well, they actually had a copy of the purchase orders and sample copies of invoices from the pipe line companies attached to the purchase orders. There might have been out of one case of the whole thing—there are also specifications of the pipe attached to the purchase orders and I think in one case they did not send sample copies of the invoice from the pipe company. The rest of them were accompanied by sample invoices from the pipe company.

Q. Do you know how this information and data regarding pipe purchases came into the possession of the Federal Power Commission in Washington?

A. No, sir, I do not.

Q. Do you know that the information and data forwarded to you regarding pipe purchases is all of the information and data that the Washington office of the Federal Power Commission in Washington has on this subject?

A. I don't know.

Q. Do you know why the Federal Power Commission office in Washington selected these particular pipe purchases to transmit to you for the purposes of this Exhibit No. 231?

A. Well I understand it is pretty generally—

Q. If you know, Mr. Hill.

A. No, I don't know.

Q. Now, aside from miscellaneous purchases that were made by the Canadian River Gas Company and Colorado Interstate Gas Company during this period, you have only five companies involved which you have used as a basis for your Exhibit No. 231, is that right?

A. Yes, sir, that is correct, with the exception of the Colorado Interstate Gas Company and the Canadian River Gas Company.

Q. And those are, as you state in your written statement, Panhandle Eastern Pipeline Company, Northern Natural Gas Company, United Gas Pipe Line Company and the El Paso Natural Gas Company?

A. And the Louisiana-Nevada Transit Company.

Q. That's right, pardon me. That makes the five of them.

A. Yes, sir.

Q. Your total purchases during this period which you have used expressed in tonnage amounts to about how much?

A. Well, there is about 90,000 tons, approximately.

Q. And the amount of pipe in tonnage required to reproduce the transmission lines of Canadian River Gas Company and Colorado Interstate Gas Company from Bivins station to Denver, together with the laterals, amounts to about how much, expressed in tonnage?

A. If I remember right, it was about 81,000 tons.

Q. Now, the purchases by the Canadian River Gas Company and Colorado Interstate Gas Company during this period amount to how much in tonnage?

A. I will have to figure it for you, Mr. Spencer. I don't have it right off.

Q. Just before you start figuring, Mr. Hill, maybe I can help you.

A. It was a very small amount of pipe.

(Vol. LXXX, pp. 11754-11764.)

* * * * *

Q. Mr. Hill, you take the pipe purchases of these companies during this period and you arrive at a weighted average price in your Exhibit No. 231. Tell me just briefly how you arrive at your weighted average price.

A. Well, we took the pipe purchases that we analyzed and put the actual purchase price in that this pipe was bought for, all f.o.b. mill prices and then we added the total tonnage, and divided into the total price of pipe and came out with a weighted average price per ton.

Q. The weighting, then, is all on tonnage?

A. Yes, this is all on a tonnage basis. This pipe was averaged in sizes from 10-¾ inches to 24 inches, inclusive, and from 8-⅝ down. It was averaged in arriving at an average price per ton.

Q. Now, will you turn to your working papers relating to pipe purchases of the United Gas Pipe Line Company?

Now, as I understand it, the invoices which you have covering these purchases state the delivered price per foot, f.o.b. destination; is that correct?

A. The pipe invoice itself?

Q. Yes.

A. Yes, sir, all pipe is billed that way, for the purpose of being able to check this pipe in the field, although the basic price of pipe is figured on the ton basis.

Q. Yes. Now, you took those prices f.o.b. destination and adjusted them to f.o.b. mill, did you not?

A. Not on the United Gas Company I did not, because they stated that all the pipe that they bought was at $43 a ton, f.o.b. the mill, and the $43 is what I used on the United Gas Pipe Line Company.

Q. What mill did it come from?

A. Well, most of it came from National Tube. In fact, I believe all of it was from National Tube.

Q. The location of it, I mean.

A. Well, the usual thing—most of this pipe was shipped out of Lorain.

Q. What state?

A. I believe it is Lorain, Indiana.

Q. Ohio?

A. I mean Ohio. Practically all this pipe was shipped out of Lorain.

Q. So that in that instance you accepted the pipe at the mill as given to you by the company, meeting the United Gas?

A. Yes, that is the way the purchase orders read.

Q. Take one of these cases where you didn't have that information on the mill price. How about Panhandle Eastern Pipeline Company?

A. The Panhandle Eastern Pipeline Company specifically states that their price is based at $48 per ton, f.o.b. mill.

Q. That is the purchase order?

A. Yes, sir, this is the purchase order for the pipe.

Q. What does the invoice say?

A. The invoice on the Panhandle Eastern is billed like all other pipe is billed, on a foot basis, all based back on $48 per ton f.o.b. the mill.

Q. Well, just tell me what the invoice says as to price, please.

A. This invoice states: "$188.13, 100 feet net."

Q. F.o.b. where?

A. This is the delivered price in Illinois. It was shipped from Lorain, Ohio.

Q. Well, in other words—

A. Mt. Auburn, Illinois.

Q. In other words, that invoice is based upon an f.o.b. price at destination and also on a footage basis rather than on a tonnage basis, is that correct?

A. That's right. Also on a footage basis. It is also subject to 2 per cent cash discount.

Q. All right, now, did you take that invoice and compute backwards to see what price you came out with at the mill per ton?

A. Well, I checked—I don't seem to have the work sheet on that, but where the ton price was stated I made a check back to the actual pipe invoice to see that it corresponded to the ton commitment and—

Q. Now, the invoice you are talking about I assume is the National Tube Company invoice, June 26, 1940, covering 434,800 feet of pipe weighing 15,488.88 tons, is that correct?

A. Just a minute, Mr. Spencer, I'll have to check it.

The National Tube invoice—I mean the purchase order to National Tube Company—

Q. I don't want the purchase order. I want the invoice, Mr. Hill.

A. Well, the invoice doesn't state the total footage, Mr. Spencer. If you want the total footage I will have to take that from the purchase order. These invoices are billed for so many pieces of 24-inch pipe. They do state it on the purchase order, that is, the quantity and feet ordered. These same purchase orders do not cover the entire purchase and they only show the footage shipped in this car.

Q. You are talking about the invoices rather than the purchase orders?

A. This is the invoice from the National Tube Company, yes.

Q. What price per ton did you use f.o.b. the mill for that particular purchase?

A. I used $45.50.

Q. $45.50?

A. $45.50—I will have to check that, Mr. Spencer.

Q. Also check to see whether that was before or after the deductions of the 2 per cent discount.

A. That was before it. I will tell you, Mr. Spencer, there was an additional 12 cents added onto the cost of that pipe for priming. I included that 12 cents, which made $45.62 less the 2 per cent discount which made the net $44.71.

Q. What I am getting at, Mr. Hill, is this: Did you make the computations to arrive at that price per ton or did you just accept some figures that were furnished to you by the Panhandle Eastern?

A. All of those prices—the purchase orders on this pipe have stated on the purchase invoice price $45.50 per ton f.o.b. mill. I checked this $45.50 back against the actual invoice to see that that was approximate. Of course, it never ran out on the exact $45.50 but it would check close enough so that you would know the basic price this pipe was bought at was $45.50 f.o.b. mill; that is, per ton.

Q. You testified a moment ago with reference to the United Gas purchase of pipe. You accepted the United's statements as to the price per ton, did you not? What I am getting at, Mr. Hill, is this: Didn't you treat the United Gas Pipe Line Company's purchase in the same manner you describe here?

A. I used the $43 per ton.

Q. That is the figure you got off of the purchase order, is it not?

A. That figure is shown on a number of purchase orders and it was relating back to the original purchase order.

Q. Did you also in that case check the invoices against the purchase orders to see that the price the company received was $43 per ton f.o.b. mill?

A. Yes, I did on the 18-inch ¼-inch wall which was the majority of the pipe they purchased.

Q. You have done all this checking yourself, Mr. Hill?

A. Yes, sir, these are all my figures. Of course, there are some corrections on this United Gas Pipe Line. If I remember correctly there was about 8,000 feet of heavy wall pipe that might have been computed at a different price but there was also a correction invoice checking it back.

Q. This Exhibit No. 231 has been prepared entirely by you, Mr. Hill?

A. Yes, sir. I made all of the calculations on this pipe and took all of the footages and what-not from exhibits 68 and 70.

Q. Statements 1 and 2 were also prepared by you?

A. Yes, sir.

Q. Do you recall how many steel mills you have involved for purchases made by these five companies?

A. The National Tube Company, the Youngstown—

Q. I am talking about plants.

A. I don't understand the question, Mr. Spencer.

Q. Well, you have had to make a calculation here to determine a f.o.b. mill price and I want to know how many different steel mills you used for the purpose of determining f.o.b. mill prices.

A. Well, I think I have that information here. I used Lorain, Ohio; Youngstown, Ohio, and McKeesport, Pennsylvania.

Q. Lorain, Ohio, and McKeesport, Pennsylvania?

A. Yes, sir.

Q. Just these two?

A. And Youngstown, Ohio.

Q. Youngstown, Ohio?

A. Yes.

Q. You did not use Milwaukee, Wisconsin? Wasn't there a lot of pipe received from A. O. Smith Corporation?

A. Well, we did purchase pipe from A. O. Smith in Milwaukee.

Q. Now, in obtaining your average freight rate I guess you show that on your Statement No. 2, Sheet 1, Column 5—no, wait a minute, it is Column 6. Can you find that?

A. Yes.

Q. Tell me how you figured that average freight rate.

A. I checked this freight rate and the freight rate used in Exhibits 68 and 70. The freight rate used in those exhibits was pretty close to what I had checked so I used the freight rate in Exhibits 68 and 70.

Q. Did you tie in your purchases of pipe from these various mills to the quantities shown in Exhibits 68 and 70?

A. Did I tie in the purchases of pipe?

Q. That's right.

A. I don't understand what you mean by "tie in," Mr. Spencer.

Q. Exhibit No. 68 and Exhibit No. 70 allocate the total quantity of pipe needed for certain mills, do they not?

A. If I am right on the thing, the freight on the pipe bought from National Tube Company on the large quantity purchases is usually equalized from Lorain, whether shipped from McKeesport or Lorain, and I think that is what is used in Exhibits Nos. 68 and 70.

Q. You divided your pipe into two classes, 10-3/4 and 24-inch, and the second type into four and one-half inch to 8-5/8 inches

A. That is correct.

Q. You state in your written statement that the purchases cover the period from December 1938. to September 1940. is that correct?

A. Yes, sir.

Q. How much of the first class of pipe purchases used were made in 1938?

A. There was very little of it purchased in 1938.

Q. Approximately 28,000 tons?

A. Well, it was a very small amount that was purchased in 1938.

Q. I should have said approximately 28 tons.

A. It is something like that. That is approximately right.

Q. Approximately 28 tons?

A. That is approximately right. I haven't added the whole thing up yet, but there was a very small amount purchased in 1938.

Q. You find no purchases of your second class of pipe during 1938, do you?

A. No, sir, I do not.

Q. Who made the purchases of the 28 tons of pipe used in 1938?

A. The 1938 purchases are shown here for the Colorado Interstate Gas Company.

Q. The Colorado Interstate Gas Company?

A. Yes, sir.

Q. And the Canadian River Gas Company?

A. Just a minute, Mr. Spencer, I will have to check this.

Q. I beg your pardon.

A. The only purchase I showed in 1938 was the Colorado Interstate Gas Company.

Q. In other words, none of your five principal companies purchased any pipe you used during the year 1938?

A. No, sir, there was not. There was a very small amount of pipe purchased in 1938.

Q. All right. I want to know approximately how many tons of both classes of pipe were purchased during the year 1939.

A. Well, the Panhandle Eastern Pipeline Company, they purchased—

Mr. Spencer: Off the record.

(Discussion outside the record.)

By Mr. Spencer:

Q. You do not have that figure readily available in your working papers, Mr. Hill?

A. The amount purchased in 1939?

Q. Yes.

A. I will have to read it.

Q. To save time, Mr. Hill, suppose I give you my figures which have been computed in answer to this question and you can accept them or reject them subject to check if agreeable with counsel.

Mr. Lange: Very well.

By Mr. Spencer:

Q. Now, Mr. Hill, my computation shows with respect to your first classification of pipe 10-3/4-inch to 24-inch in 1938 approximately 28 tons were purchased; in 1939, 60,556 tons—

A. That is the same classification now?

Q. Yes. And in 1940, 19,594 tons, making a total of 80,178 tons.

As to the second classification which is 4-1/2-inch to 8-5/8 inches, it is indicated as follows: 1938, no purchases; 1939, 11,442 tons; 1940, 1369 tons; total 12,811 tons.

A. Those were taken off my sheet, I imagine they are approximately right, Mr. Spencer, but I wouldn't say until I had time to check them. I would be glad to do that.

Q. Will you accept them as being correct, subject to check?

A. Yes, sir, I will.

Mr. Lange: Subject to Mr. Hill's check?

Mr. Spencer: Yes, or Mr. O'Connor's check, for that matter.

Let it be understood, Mr. Examiner, if this is not a correct computation counsel can put in a corrected one at any time, whether Mr. Hill is here or not.

Mr. Lange: That is all right.

The Trial Examiner: Very well, Mr. Spencer.

Mr. Spencer: I assume Mr. Hill will not take his working papers with him in any event?

Mr. Lange: No, they will be available here.

Mr. Spencer, do you have a copy of that computation so that Mr. Hill may have the information for the purpose of checking it?

Mr. Spencer: I will have a copy of it made.

Q. If these figures are correct, Mr. Hill, you have substantially no purchases in 1938, is that correct?

A. That is correct, a very small amount.

Q. The bulk of your purchases were made in 1939, were they not?

A. Yes, sir, and in the first part of 1940. The majority of the pipe was purchased in 1938 and some of the pipe was delivered in 1940.

Q. That might be so—

A. I mean purchased in 1939.

Q. You are not prepared to say, then, Mr. Hill, are you, that the average weighted pressure of pipe which you used in your Exhibit No. 231 is indicative of pipe prices existing as of December 31, 1938?

A. Well, most of the pipe was purchased in 1939 and 1940. I think the average price would be more during that period of time, 1939 and 1940.

Q. The prices of the pipe which you do use—the few purchases you did make in December 1938—were higher than those used in Exhibits 68 and 70, is that correct?

A. Yes, sir, but they were all purchased in small quantities. They were less than carload.

Q. Do you know how many miles of pipe line were constructed by natural gas companies during the period December 1938 to September 1940?

A. No, I don't

Q. Would you care to express an opinion on the amount of mileage that might have been constructed during that period?

A. I wouldn't know offhand. There were so many small lines and lateral lines built in that time and small quantities of pipe purchased, I think you would be making a guess on that if you did give a figure.

Q. How many miles of pipe is represented in the purchases you have made?

A. Approximately 900.

Q. You have small pipe in there, too?

A. Yes, sir, I have small pipe in there, too, but it was all bought on the same purchase order. I haven't made any attempt to determine the exact number of miles of pipe installed in the last two or three years.

Q. I take it that it follows, Mr. Hill, you do not know how many pipe line projects or how many major purchases of pipe during this period have been eliminated by you in arriving at your conclusions, is that right?

A. All I had to go on was the five companies I have used. It seems reasonable to me to believe that if they purchased pipe during this period at that price that other companies could purchase it at somewhat the same prices.

Q. You do know of pipe line projects that were constructed during this period which you have not included, do you not?

A. Not in any long pipe lines offhand with the exception of the line that was built to Milwuakee. That is about the only line I know of of any size or consequence built during this period. There was one line that was built from Panama City or Pass Christian during this period but I didn't have anything on it.

Q. You have no data on that?

A. No. It was just a small pipe, an 8-inch pipe, I believe, and as I understand it, I don't think the line has been completed yet.

[Testimony of WITNESS HILL (continued.)]

Q. I believe you testified before that you did not know whether the Federal Power Commission office in Washington furnished you with all the information and data they have on this subject?

A. No, sir, I don't have access to those files in Washington.

Q. Now, I will read you a list of companies here that are engaged in the natural gas business and I will ask you if you consider them major companies with respect to that business: Oklahoma Natural Gas Company, Lone Star Gas Company, Hope Natural Gas Company, East Ohio Gas Company, Arkansas Natural Gas Company, Cities Service Gas Company, Columbia Gas & Electric Company, Memphis Natural Gas Company and Southern Natural Gas Company.

Do you consider those companies major companies in the business?

A. Yes, sir. Since you mentioned those names, I can tell you more pipe that has been put in if you would like to have it. I couldn't recall it at the time.

Q. Well, I think it will suffice for my purpose to ask you just one more question.

You have not taken into consideration any purchases of pipe for any of those companies during the periods you have used?

A. No, sir, I had nothing on the purchases of the pipe by those companies.

Q. You do know they bought pipe?

A. Yes, sir, I know they bought pipe.

Q. And in substantial quantities?

A. I think the Memphis Natural Gas Company bought a good deal. They looped some lines. I know Southern Natural Gas Company looped some line in the last year, however, I don't know how much pipe was used but it was a good deal. I know they are looping some line over there now.

Mr. Spencer: Off the record.

(Discussion outside the record.)

By Mr. Spencer:

Q. In connection with this study, Mr. Hill, you have not made any inquiry of pipe manufacturers for pipe prices, I take it?

A. No, sir, I have not.

Q. Do you have any knowledge, Mr. Hill, of current quotations of pipe manufacturers for line pipe such as you have studied here?

A. Nothing more than what I have used in this exhibit.

Q. What would you say as to the general level of the prices on large diameter pipe during the year 1939?

Mr. Lange: What do you mean by "large level," Mr. Spencer? You might indicate what sizes you have in mind.

Mr. Spencer: Let's use his first classification.

The Witness: Will you read the question, please?

(The question referred to was read by the reporter as set forth above.)

The Witness: I would say it would be what pipe had actually been purchased for during the year 1935—I mean 1939.

By Mr. Spencer:

Q. Perhaps my question was not very clear. I mean the level of prices for such pipe during the year 1939 in relation to prices for such pipe during previous years.

A. I don't have any large quantities purchased in 1938 so I don't actually know what the large quantity purchases were in 1938. I have just a few l.c.l. prices for 1938 in comparison—

Q. Pardon me.

A. In comparison with 1939 and 1940 when the prices were practically the same. There wasn't a great deal of difference in them.

Q. What do you say about 1937?

A. I imagine pipe prices were lower in 1937 than they are in the present day market.

Q. What do you say about the relationship with reference to present prices?

A. With 1937?

Q. No, I am comparing 1939 prices, the 1939 level of prices with the present level of prices.

A. I would say—I really don't know, Mr. Spencer. I don't know what the first quarter prices of 1941 are as I have made no analysis of it.

Q. I don't want you to answer the question unless you do have some knowledge of it, Mr. Hill.

Taking all of the pipe that you have used here in your computations, do you know which of the pipe was rolled on order and which was delivered on what you might term "on mill run"?

A. I imagine all of the larger purchases were rolled on order. That is the way pipe is usually manufactured. The pipe companies very seldom carry a large stock of pipe. I imagine all of the larger orders of pipe were rolled on order.

Q. That is your opinion, is it?

A. Well, I think it is reasonable to believe there is no pipe company in the country that would carry as much pipe as some of these orders called for. I don't think they would do that.

Q. Well, look at your working papers on the El Paso Natural Gas Company. Do you find purchases made there from the Phelps-Dodge Mercantile Company?

A. Yes, sir, I am sure they purchased pipe through them.

Q. Well, does it seem reasonable to believe that pipe was rolled on order?

A. I have no reason to believe it wasn't, Mr. Spencer. It was shipped directly from the mill. If the mill had a stock of this pipe in the yard they might have shipped it off the yard, but they usually don't carry large stocks of pipe.

Q. But the seller here was Phelps-Dodge Mercantile Company, was it not?

A. Yes, sir, as agent for National Tube Company.

Q. Do you know whether or not Phelps-Dodge Mercantile Company hadn't acquired that pipe previously for a different purpose than what it was used for here?

A. I couldn't say that. I know this pipe was shipped.

directly from the mill, it wasn't shipped from Phelps-Dodge Mercantile Company. Whether they had previously placed an order for the pipe, I couldn't say.

Q. You don't know the details of that?

A. No, sir, I don't.

Q. Do you know the terms and conditions of payment for this pipe? By that I mean whether or not payment was made in cash or securities or in some other form of consideration?

A. I notice they took a 2 per cent cash discount on it, so I imagine the pipe was paid for in the limited time for the 2 per cent discount, which I believe was ten days. It may be a longer time for this outfit. Sometimes it is longer than that. I would say it was on direct sale.

Q. I am asking you generally about all these purchases you have involved. Do you know of your own knowledge what the terms and conditions of payment were for that pipe?

A. I don't know, Mr. Spencer, other than the majority of them took 2 per cent cash discount which would lead me to believe it was a cash transaction.

Q That doesn't necessarily follow, does it?

A. Well,—

Q. If payment is made in some other form of consideration than cash, the purchaser might still be entitled to the discount?

A. It might have been. I wouldn't say because I didn't see the money actually change hands.

Q. I asked you a question a moment ago about the general level of pipe prices in 1939 in relation to other years and I believe you answered that you hadn't made a study of that. I wish you would turn to your working papers on United Gas Pipe Line Company and read into the record the notation appearing at the bottom of the last page of the report or statement made by United Gas Pipe Line Company.

A. This notation is at the bottom of the page. It states: "Attention is directed to the fact that this pipe was purchased at abnormally low prices and in no wise is representative of prices paid by this company for other pipe in its system. The cost of pipe as shown herein is subject to minor adjustments for additional freight charges on cer-

tain of the pipe which was reconsigned enroute for which charges the vendor has not rendered invoices."

Mr. Lange: A copy of that invoice was made available to the company staff to examine, wasn't it?

The Witness: Yes, sir, that is right, it was made available.

Mr. Spencer: It is not only on the invoice but the whole thing was made available, Mr. Lange.

The Witness: This was not an invoice and it was not on the purchase order. This is a summary of purchases on purchase order 75131, dated September 18, 1939, and filed with the Federal Power Commission.

Mr. Lange: By the company?

The Witness: By the company, yes, sir.

By Mr. Spencer:

Q. Now will you turn to Statement No. 2 of your Exhibit 231?

A. Yes.

Q. Do you show the same cost per foot for all sizes of pipe from 10¾ inches in diameter to 24-inch diameter?

A. Yes, sir.

Q. Is that the usual practice of the industry?

A. Well, I wouldn't say it was the usual practice, Mr. Spencer. We found in analyzing the actual purchase orders for pipe that we had pipe from 10¾ inches to 24 inches that had been bought at the same purchase price per ton.

Q. Isn't it a fact that the pipe manufacturers charge less per ton for sizes from 4 inches to 6⅝ inches in diameter out of this whole group that you have used?

A. You say the least price per ton?

Q. Yes, the lowest price.

A. No, sir, I wouldn't say so.

Q. Would you say that they charged more per ton—

A. Yes, sir, I think they do.

Q. —for pipe in the bracket from 4 to 6⅝ inches?

A. We are speaking on a tonnage basis.

Q. Yes.

A. Yes, sir.

Q. That is not your experience?

A. No, sir, I think the smaller the size of the pipe the more the cost would be of fabricating that. I couldn't expect to buy a 1-inch pipe for the same tonnage price as I would a 4½-inch pipe.

Q. I didn't go down as low as one inch, but that is all right for illustrative purposes. When you make that answer to me, are you taking into account the different discounts that are granted upon different sizes of pipe?

A. Well, they vary all over the place as far as discounts of pipe are concerned. One person may get this discount and the other person over here may get something else. I know that if I buy a certain amount of 4½-inch pipe, over and above that amount I would get a special discount, or on any other size where you would order a quantity of it.

Q. Well, let me put it this way: Taking into consideration the whole scale of pipe sizes and quotations made under the same conditions to the same party, would it not be true that you get a greater discount for certain smaller sizes of pipe here which give you a much lower price?

A. If you would take it on quantity purchases and—I have seen the time when we could buy 4½-inch pipe on account of the quantity discount practically as cheap as we could buy 3½ inch pipe, but we bought enough 4½-inch pipe to give us that additional discount.

Q. Do you know what the current rates of discounts are on pipe purchases?

A. No, sir, I do not.

Q. Let's get at the problem this way: How do you justify using a flat price per ton for all classes of pipe?

A. Well, I have all classes of pipe from 10¾-inch to 24 inch at the same price per ton.

Q. Is that your answer, then, because it has been done in certain transactions?

A. It was bought in 1939 and 1940 at the same price. I merely grouped this pipe, that is, from 10¾ inches up to get an average price.

Q. It wasn't done in all the cases you have used, however?

A. I don't understand that question.

Q. It wasn't done in all the cases that you have used, however, was it?

A. You mean the grouping?

Q. In all the purchases you have used.

A. I don't understand what you mean, Mr. Spencer.

Q. You answered my question this way: You said that you had used flat prices for all sizes of pipe because you found the sales had been made on that basis during the period you have used, is that correct?

A. That is correct, from 10¾-inch pipe to 24-inch pipe.

Q. But it is not true as to all of the purchases you had utilized here in arriving at your computation?

A. Well, no, the majority of this small pipe was bought by the United Gas Pipe Line Company on one purchase order. The other pipe was in somewhat larger size and some of it was in somewhat smaller size.

Q. But not at a uniform price?

A. No, sir.

Q. Take one of those purchases where you say that the manufacturer sold all sizes of pipe at one price. How do you know what weighting the manufacturer did in order to arrive at that kind of a flat price?

A. I know that all steel is based upon a ton price. It makes no difference whether you are buying pipe or structural steel, the basic charge for that is on a ton basis and the United Gas Pipe Line Company, as I have stated before, bought all sizes and weights of pipe from 10¾-inch to 22-inch at the same price of $43 per ton, f.o.b. the mill.

Q. Do you know of any pipe manufacturer's quotations where they give a flat rate for all sizes of pipe?

A. I don't know of any quotations. It is according to the amount of pipe you are going to buy. If I am going to buy two or three miles of 22-inch pipe and I want a small amount of 10-, 8-, or 4-inch pipe, I can usually buy that small amount, having it thrown in for the same price at which I buy the other pipe.

Q. It is a matter of negotiating at the time of purchase, isn't it?

A. Yes, sir, it is.

Q. Isn't it possible that in applying this situation to Colorado Interstate Gas Company and Canadian River Gas Company that the flat price they came out with, assuming they were conducting these negotiations, would be different from the flat price United or somebody else came out with

because of sizes and quantities they had involved were also different?

A. If they stay by the larger quantities and larger sized pipe, it seems to me they should be able to get—

Q. I am only talking about differences.

A. They would differ—will you read the question, please, Mr. Reporter?

(The question referred to was read by the reporter, as set forth above.)

The Witness: They could be either higher or lower at negotiated prices.

Mr. Spencer: Mr. Examiner, I think we ought to take a short recess at this time.

The Trial Examiner: Very well, we will take a 5-minute recess.

(At this point a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

By Mr. Spencer:

Q. Would you say, Mr. Hill, that the pipe manufacturers' quotations covering prices and discounts as to various sizes of pipe was an indication of the manufacturers' idea or conception of the relative cost and value of the different sizes of pipe?

A. That would be all based on the quantity of pipe that you were purchasing, it seems to me.

Q. Well, assume the same quantities for the purpose of answering the question.

A. There would be some difference on the ton price for different sizes of pipe.

Q. Assuming the same quantities of pipe, that would be true, would it not?

A. There would be some difference.

Q. Now, you have made your working papers available to us, Mr. Hill, and we have computed the tons of pipe involved in the various sizes from 10¾-inch to 24-inch.

A. Yes.

Q. Which I will read into the record:

24	Inch	30,378	Tons	37.89	Per Cent
22	"	187	"	.23	"
20	"	2,180	"	3.50	"
18	"	15,260	"	19.03	"
16	"	23,344	"	29.12	"
14	"	185	"	0.23	"
12¾	"	7,838	"	9.78	"
10¾	"	177	"	0.22	"
		80,178	"	100.00	"

Now, subject to check by you or Mr. O'Connor and subsequent correction of the record, does that seem approximately correct to you, Mr. Hill?

A. I think it does.

Q. Now, as we figure it, the various sizes and tons of pipe which will be required by Colorado Interstate Gas Company in a reproduction of its present line would be as follows:

22	Inch	32,986	Tons	59.03	Per Cent
20	"	19,309	"	34.55	"
16	"	1,621	"	2.90	"
12¾	"	343	"	.61	"
10¾	"	887	"	1.59	"
10	"	737	"	1.32	"
		55,883	"	100.00	"

Do you think if your purchases of pipe which you have used here had had these sizes and this tonnage which would be required by Colorado Interstate Gas Company, that your average weighted price would have been different?

A. I think that since the majority of the pipe used—

May I take the two companies combined, or do you just want the Colorado Interstate? I have used them combined.

Q. For the purpose of answering the question you may take into consideration our computation as to the sizes and tonnage of pipe required by Canadian River Gas Company to reproduce its portion of the present main line, which is as follows:

.22	Inch	19,115	Tons	98.85	Per Cent
6⅝	"	32	"	.16	"
4½	"	46	"	.24	"
3½	"	107	"	.55	"
2⅜	"	38	"	.20	"
		19,338	"	100.00	"

Now you can answer them both together, Mr. Hill.

A. Well, I would say that if the Canadian River Gas Company and the Colorado Interstate Gas Company bought all this pipe at the same time that this amount of pipe involved—that they would undoubtedly get the same price for the whole lot; that is, as far as the tonnage basis goes.

Q. That isn't quite the question I had in mind. I asked you if you think your average weighted price would have been different.

A. Well, there might have been some small discrepancies there. As I say, all of these prices are negotiated. The majority of the pipe in the system being 20- and 22-inch pipe would have a greater bearing on it than the smaller sizes of pipe from a tonnage standpoint.

Q. That is to say, the average price that you come out with is influenced or predominated by the size of the pipe that you want the greatest quantity of, is that correct?

A. From the 10¾-inch to the larger size, 22-inch, which is the majority of the Canadian River and Colorado Interstate pipe. I have used a different price from 8⅝ inches down, based on the information that I had that the cost of 8⅝ inches down at that time is a different average price and somewhat higher than 10¾-inch to 24-inch.

Q. Well, is it true, assuming those figures are correct, that 22-inch pipe which you have used in your calculations constitute less than one per cent of the total tonnage of pipe used?

A. Yes, and the 8-inch pipe and the 24-inch pipe that I have used for my calculations constitutes a good sized portion of this pipe. I would think it would be reasonable to believe that the price of 22-inch pipe would be somewheres between the 18-inch and the 24-inch, although I didn't have that in here.

Q. Well, if you combined all of your prices between 18 inches and 24 inches, inclusive, what is the approximate

total percentage as shown by my figures? Just roughly, Mr. Hill.

A. Well, I figure something over 60 per cent of it.

Q. I think that's right. Now, what percentage of the 22-inch pipe is shown in my calculation for Canadian River Gas Company?

A. 22-inch pipe.

Q. Yes.

A. 98.85 per cent according to your calculations.

Q. That is to say, less than 2 per cent of the total tonnage of pipe required is represented by smaller sizes of pipe, is that correct?

A. Yes.

Q. Now, assuming that you and I are experienced pipeliners, and I make the assumption to cover myself rather than you, and we wanted to reproduce the present main line of Canadian River Gas Company and Colorado Interstate Gas Company from Bivins to Denver and assuming that we had construction contracts and we wanted to get the job done in the shortest possible time and it was up to you and me to buy the pipe for the line, to have it on the job at the proper time so as not to delay construction. How would we go about it?

A. I don't agree with the way we go about it, because if I was going to purchase this amount of pipe and going to build it I would never put the construction through in the field until my pipe prices had been negotiated and I knew that I had pipe coming out of the mill that I could put in the ground.

Q. Well, you line it up to suit yourself. We have got to build a pipe line here and we have got to get the pipe for it; so you line it up to suit yourself.

A. All right, sir. Then we would go into the open market, I assume, to buy this pipe and take quotations on it and we would buy it at the cheapest price we could possibly buy it for.

Q. What is the first thing you do about the purchase of pipe?

A. Well, the first thing that I would do about the purchase of pipe would write the specifications on it—the type of pipe I wanted.

Q. Would your specifications include designations of time and place for deliveries and matters of that character?

A. Well, that is usually taken care of at the time that you actually start shipping your pipe or at the time you make your negotiations for the price of pipe. Your order has to be placed, of course, before those shipping instructions can go out.

Q. Do you agree with me that the time element on the delivery of pipe is an essential element of our negotiation?

A. Yes, sir, it is, Mr. Spencer. Sometimes the agreement is usually made at the time of purchase—at the time of placing the purchase order the amount of pipe you want delivered, whether a mile or two miles or two and a half miles a day, after that pipe gets under way, you usually get the pipe pretty promptly.

The mills seem to be able to turn it out pretty well; however, I have allowed cost in Exhibit 231 for tracing shipments of pipe and making pipe available promptly so it won't hold up construction work.

Q. Well, let's eliminate the tracing for a moment. We are going to be very efficient for a moment and not do that. Let's assume that we have figured out our specifications and we know when and where we want the pipe delivered.

Now, I think you said you get quotations next, is that right?

A. You negotiate the price of the pipe; yes.

Q. We get the quotation before we start negotiating, do we not?

A. Well, that is usually the way.

Q. We get it from several companies, I assume?

A. Yes, sir.

Q. Do we take into consideration the location of these plants and mills from the standpoint of freight?

A. They do sometimes. A lot of times you purchase pipe of National Tube Company and if the purchase orders—I mean the quotations, are anywhere near close, why, whether the pipe be shipped from Youngstown or McKeesport or from Lorain, they will usually equalize that freight on such and such a point on a large part of the purchase.

Q. Now, we know what we want and we have these quotations. Now what do we do?

A. Well, take your quotations on pipe and make a sum-

mary of them and if you think the prices are too high, why, you can call the men in and do a little more negotiating. If you think the prices are right, if you have got a low bid in there, I think it would be proper to place that low bid with the pipe manufacturers that put that low bid in there.

Q. Is it fair to say, then, that we keep shopping around on these quotations until we get a proposition that seems most economical to us?

A. That is usually the way it is done. You aren't going out and pay an excessive price for pipe if you can get it cut down a little.

Q. Would you say that the amount of pipe and other factors involved in a transaction such as we are assuming would be a very large order for any steel mill?

A. Yes, it would be a pretty good sized order; yes, sir—81,000 tons of it. They wouldn't accept such an order a few years back.

Q. You could probably count the number of mills in the United States pretty easily that could handle an order of that size in the time limits that would be placed upon it, is that not true?

A. Pipe is usually split between mills on that account but they usually get the same price on it.

Q. Now, can you tell me, or can you say fairly that you have any purchase of pipe which you have used in your Exhibit No. 231 that is comparable to the transaction we have just discussed?

A. You mean according to the size—20 and 22 inch?

Q. Size and necessity and everything else.

A. I think all of these pipe purchases that were made by these different companies were negotiated just like we talked about them being negotiated. It is true that we don't have a great deal of 22-inch pipe.

Q. Well, what do you have in the way of tonnage as compared to the tonnage involved here, Mr. Hill? As I recall the figure we discussed this morning was approximately 30,000 tons for Panhandle Eastern as the highest.

A. That's about right, yes, sir. That's 30,000 tons to Panhandle Eastern and the United was the next largest purchaser that we have. Do you want to refer back to your pipe?

Q. Yes.

A. I think that the reason that I have averaged these

prices in here is to get an average price for the simple reason I didn't have a lot of 22-inch pipe in there, but it seems reasonable for me to believe that the largest purchase that I have was 18-inch and 24-inch pipe, but that price of 22-inch pipe would be some place between those prices; that is, between $43 a ton paid to National Tube Company by United Gas Pipe Line Company for 18-inch pipe and $47.04 per ton paid to A. O. Smith Corporation by Panhandle Eastern for 24-inch pipe.

Q. Well, I will ask you this question: Is there any way for you and I to tell at the moment what price might result from our negotiations in this assumed transaction?

A. I couldn't say, Mr. Spencer. I couldn't answer that because I don't know what price. We might go up there and get it for a much cheaper price than this I have used. That's the reason I have used an average price.

Q. And also it might be higher?

A. Also might be higher, yes.

Q. I think that's right. Now, in addition to pipe prices, you have also made some treatment in your Exhibit No. 231 of Dresser couplings, is that correct?

A. Yes.

Q. In that connection, I believe you stated that the Denver line was constructed with pipe, Grade A lapweld pipe with average length of 19 feet?

A. Yes, sir. That was taken from Exhibits 68 and 70.

Q. And in that way one Dresser coupling would be required every 19 feet?

A. Well, on the average. I say, it wouldn't be every 19 feet, because pipe doesn't run that way.

Q. Approximately that?

A. Yes.

Q. Now, I believe for the purposes of your computations in Exhibit No. 231, you are substituting Grade B, seamless. You are basing your computations upon pipe of a different grade.

A. Are we talking about couplings or pipe? I understood it was couplings.

Q. I am trying to get down to the point where you eliminate about half of the Dresser couplings. I may be going about it in a poor manner, but with that explanation you might explain what you have done here.

A. I have used double random length pipe instead of single random length pipe, which is a common practice.

Q. In other words, you have substituted double random pipe for the average 19-foot lengths?

A. Yes, taking into account that the price was approximately the same.

Q. And by doing that—I finally arrive—you eliminate about half of the Dresser couplings?

A. Yes, sir.

Q. This double random length pipe represents an improvement of pipe construction since the main line of Colorado Interstate and Canadian River Gas Company was constructed?

A. Yes, sir, it does. That is for large-sized pipe.

Q. You do not question the fact that the present line is constructed of lapweld pipe with an average of 19 feet per joint?

A. No, sir, that is the way it was constructed.

Q. Are you questioning the design of the engineers in constructing a pipe line with that type of pipe at that time?

A. No, sir, I am not.

Q. You also are not questioning the fact that the company bought, paid for and installed all of the Dresser couplings that are indicated in Exhibits Nos. 68 and 70?

A. No, sir, I am not.

Q. Have you taken into consideration any additional cost in installing your double random length of pipe rather than what was used?

A. I have not figured any construction cost whatever.

Q. Do you have any ideas on that subject?

A. Well, it would run approximately the same I think. It may cost you a little more to handle double length pipe, but you would have a saving there on cutting out one coupling. I really couldn't say about the construction cost, as I haven't gone into it, Mr. Spencer.

Q. Would you use double random length pipe throughout the whole line—I mean over the mountains and through the valleys and under the rivers?

A. Well, I have been over that line, Mr. Spencer, and there is approximately—this is offhand now—just offhand I would say there would be approximately 80 per cent of that line that you could use double random length pipe on.

In places like the Purgatoire River crossing there I would say that maybe some single random length pipe would go in there. It doesn't amount to a great deal.

Q. You think that at least 80 per cent could be constructed with double random length pipe?

A. That's just offhand. I wouldn't want to say without going back into my papers on it. This is just on the pipe price is all.

Q. Have you taken into consideration—well, if you can't use double random pipe throughout the length of the line, there would be no occasion to buy that much double random pipe, would there?

A. All but the exception of a small amount of it, you could use double length. On the other side of the Purgatoire River I might have a few joints in there going down one side of the canyon and up the other where I might choose to use single random length pipe, although I could put the double random in there, I think.

Q. You made no adjustment for that is these calculations?

A. No, sir, I have not.

Q. Now, would you consider the fact that this line as now installed consists of single random length pipe evidence of obsolescence in the existing line?

A. No, sir. All I have done is take advantage of the development in the art of making pipe, that's all. I didn't take into consideration obsolescence.

Q. Well, do you consider that an improvement in the art of pipe line construction results in obsolescence?

A. Well, I wouldn't say that. I don't think you would have any obsolescence in the pipe, that it would become so that the gas couldn't pass through it. I think it will stay there.

Q. What I am trying to find out here, Mr. Hill, is, if you have given us enough credit in your depreciation studies here of this pipe line in view of what you think about single random length pipes.

A. It wouldn't have any effect on the lives that I have set on this pipe.

Q. It wouldn't?

A. No.

Q. The pipe is all right, is it, what we have?

A. Yes, sir, it is in good condition. It's all right.

Q. You have no criticism of that?

A. No criticism on the pipe.

Q. I take it your answer is, then, that you don't recognize any obsolescence in the existing pipe line?

A. No, sir.

Q. Now turn to your Exhibit No. 231-A, Mr. Hill.

A. Yes, sir.

Q. Start me off on this cross examination. Can I impose upon you to give just a brief explanation of what the intent and purpose is of this particular schedule?

A. You want me to explain it?

Q. Yes, please.

A. All that I have done here is—the majority of pipe that I analyzed was seamless Grade B pipe and most of it in double random lengths. All that I have done here is to substitute a seamless Grade B pipe for the lapweld pipe that is now in place in the line.

Q. Which results in what?

A. Which results in a saving of some $674,135.

Q. Because we have less tonnage?

A. Yes, sir.

Q. Now, I don't want to duplicate my questions, but I will have to ask you a few. There isn't any question but what the present line as it now exists is a Grade A lapweld pipe?

A. According to Exhibits 68 and 70, yes, sir.

Q. And the pipe that you are proposing to substitute here is a different grade and a different type of pipe?

A. It is a double random length pipe, Grade B, yes, sir.

Q. Now, how do you get less tonnage by the use of your substitute pipe?

A. You have a little less wall thickness for the same operating pressures.

Q. I thought so. Now what does wall thickness have to do with the life of the pipe, Mr. Hill?

A. Well, wall thickness and the life of the pipe depend on the soil conditions that the pipe is placed in.

Q. Would you say generally that a thick pipe has longer life than a thinner pipe under identical conditions?

A. I think it would, yes, sir.

Q. Now, what other differences are there in the two

types of pipe other than wall thickness—I mean important differences, Mr. Hill?

A. Oh, nothing except the working pressures of the two.

Q. What would you say about the metallurgical composition of the pipe itself?

A. Grade B is much higher than Grade A.

Q. Higher what?

A. Well, the tensile strength in it is much higher.

Q. It would have to be that or it couldn't stand the pressure.

A. That's right.

Q. Well, do you know whether there is any difference in composition which might lead one to deteriorate more rapidly than the other, leaving out the question of wall thickness?

A. Well, years ago they used to claim that maybe wrought iron or open hearth iron might last a little longer than steel but that is not prevalent in the practice of making steel today. Steel pipe today will last just as long as open hearth or wrought iron pipe, according to the steel companies' specifications on it.

Q. You make your substitution here of pipe only for the reason that it results in a lower cost?

A. Yes, sir.

Q. No other consideration?

A. It is a lower cost and if you are buying that pipe today or building this line today, you undoubtedly wouldn't use the single random length pipe. You would use a double random length pipe.

Q. And here again you are not questioning the design or construction of the pipe line in the first instance by its engineers?

A. No, sir. At the time that line was built that was good construction.

Q Well, I want to ask you to explain for the record the source of your formula for converting one type of pipe to the other type of pipe.

A. Well, all we did was to use the working pressures of Grade B seamless and the working pressures of the Grade A lapweld and took corresponding pressures in the seamless pipe equal to the working pressures on the lapweld.

Q. What tensile strength did you use for Grade A lapweld pipe?

A. Tensile strength in Grade A lapweld pipe is about 45,000 pounds per square inch.

Q. 45,000 pounds per square inch?

A. Yes, sir.

Q. Give me the same figures for the other.

A. For the Grade B?

Q. Yes.

A. 70,000 pounds.

Q. What is your source of information for those figures?

A. The National Tube catalogue.

Q. What date?

A. It was copyrighted in 1939.

Mr. Spencer: Mr. Examiner, I have completed my cross examination on Exhibit No. 231 and Exhibit No. 231-A in so far as I can go at this time. I think Mr. Hill may be released and if any additional questions need to be answered I understand from Mr. Lange that undoubtedly Mr. O'Connor can be made available to answer them and that will be satisfactory to me.

Mr. Lange: Of course, it would depend upon whether the additional information that you may seek at that time applies only to the matters of computations, because Mr. Hill is the one that has made this study, that is, the one who has computed the figures from the information he received that was furnished by the company.

Mr. Spencer: I am sure I will not want anything that Mr. O'Connor will not be able to testify to.

Mr. Lange: I see.

Mr. Spencer: And I may need nothing more.

The Trial Examiner: Do you have any redirect, Mr. Lange?

Mr. Lange: Yes.

Redirect Examination.

By Mr. Lange:

Q. Mr. Hill, Mr. Spencer referred to the matter of a number of companies, giving their names, who he says are

in the industry and they have had construction of considerable mileage of pipe lines. Now, as far as you know, that is just hearsay? You have made no investigation yourself?

A. No, sir, I have made no investigation myself.

Q. As to whether any of those companies had any construction or the mileage of any such construction?

A. No, sir, I haven't made a study. It is just a common practice in the gas business to grapevine those matters.

Q. That is the only way you heard of that?

A. Yes, sir, and from reading technical magazines.

Q. You have no knowledge as to what extent this line that you call the Milwaukee line has been built or what portion of that mileage or anything in connection with it? It is just hearsay?

A. It is just hearsay with me and what I have read in technical magazines.

Q. You haven't heard any line has been constructed into Milwaukee?

A. No, sir.

Q. You don't know whether any line labeled the Milwaukee Pipe Line has been in fact constructed?

A. I couldn't tell you.

Q. Reference was made as to the basic material you utilized in preparing Exhibit 231 which consists of, first of all of the invoices or copies of the invoices of pipe purchases, isn't that true?

A. Yes, sir, I have those invoices of pipe purchases.

Q. Those are actual?

A. Yes, sir, they are actual invoices from the pipe line companies.

Q. The invoices represent actual purchases, that is, they are photostatic copies of actual purchase orders?

A. Yes, sir, that is what they are.

Q. Reference was also made to what was termed sample invoices. Explain exactly what you mean by the use of the word "sample" in connection with those invoices.

A. I meant by that that I didn't have all of the invoices covering the purchase orders. It was just a portion of the invoices that were sent along with the purchase orders.

Q. But in the actual mechanics the purchase order was actually made?

A. Yes, sir.

Q. In following that certain deliveries were made under those purchase orders?

A. Yes, sir.

Q. Those certain deliveries were covered by what you would term sample invoices?

A. Yes, sir, that is correct.

Q. The word "sample" was utilized because there may have been some subsequent shipments under those purchase orders that had not been completed?

A. Yes, sir, there was. I don't have all of the invoices to back these purchase orders up.

Q. The reason I wanted to bring that out was the word "sample" might have been somewhat misleading, it being hypothetical. It is just the other way around, isn't it?

A. Yes, sir.

Q. It is the concrete performance of the purchase order, that is, one purchase of it?

A. Yes, sir.

Q. So that these purchase orders, when followed by sample invoices, show that the purchase orders were actually being put into effect and being carried out?

A. Yes, sir.

Q. And that obtains with reference to all of the sample invoices that you have in your working papers?

A. Yes, sir.

Q. They followed through on the original purchase orders?

A. Yes, sir.

Q. You were requested by Mr. Spencer to make some computations. I think the figures are reflected on one of those sheets given to you, the conversion of the 16 to 24-inches of the total. Have you calculated that?

A. No, sir, I have not.

Q. What I want to know is what the 16 to the 24 inches are to the total per cent.

A. I haven't figured that out. I will have to go through these working papers.

Q. You had it figured from 18 to 24. I wanted it figured from 16 to 24.

A. All right. That amounts, according to Mr. Spencer's calculations, to 88.77 per cent.

Q. Now, you have had occasion to carefully examine

Exhibits Nos. 68 and 70 in connection with the preparation of your Exhibit No. 231, have you not?

A. Yes, sir.

Q. I think in order to get into the record the tonnage figures—we have calculated those as to each of the companies, as well as to the total companies—I will ask you to check these figures to see whether you find them correct, and also the percentage of the main line to the total

A. Yes, sir, these figures check with my work sheets.

Q. Will you read those figures into the record, Mr. Hill, if they are correct as you found them from your examination? Are they correct as you found them?

A. According to my working papers, the tonnage that is shown on this sheet is correct.

Q. Are the percentages there calculated correctly?

A. Yes, sir.

Q. Very well, if you will read them into the record.

A. Canadian River Gas Company—

Q. That is, subject to any check Mr. Spencer may desire to make.

The Trial Examiner: Why not have them copied into the record by the reporter?

Mr. Lange: That is satisfactory.

(At the direction of the Trial Examiner, the following figures were copied into the record.

Canadian River Gas Company

Total Tonnage (Exhibit 68)	19,345 Tons
Main Line (Exhibit 231-A)	19,114 Tons
Main Line Per Cent	99 Per Cent

Colorado Interstate Gas Company

Total Tonnage (Exhibit 70)	61,392 Tons
Main Line (Exhibit 231-A)	52,295 Tons
Main Line Per Cent	85 Per Cent

Both Companies

Total Tonnage (Exhibits 68 & 70)	80,737 Tons
Main Line	71,409 Tons
Main Line Per Cent	88 Per Cent

By Mr. Lange:

Q. Mr. Hill, these copies of actual purchase orders of the companies, each one of them bears the date of the execution of it?

A. Yes, sir.

Q. I wonder if you could read those into the record with each company name. How many of them do you have?

A. There would be five major purchase orders.

Q. All right.

A. This is the purchase order issued to the National Tube Company by the United Gas Pipe Line Company, dated September 18, 1939. It covers shipments of pipe on into the year 1940.

This is a purchase order issued to the National Tube Company by the Northern Natural Gas Company, dated August 10, 1939.

This is a purchase order issued to the Youngstown Sheet & Tube Company by Northern Natural Gas Company, dated August 12, 1939.

This is a purchase order issued to Republic Steel Corporation by Northern Natural Gas Company, dated August 12, 1939.

Q. How many have you altogether in that list, Mr. Hill?

A. There are several purchase orders scattered through here and the same company may have issued two or three of them.

Q. They are?

A. Yes.

Mr. Lange: I think we may save time by having that list made up by Mr. Hill. Then we can put it in the record rather than have him read it into the record.

The Trial Examiner: You want to strike that portion he has read?

Mr. Lange: Yes.

The Trial Examiner: All right.

By Mr. Lange:

Q. Mr. Hill, will you prepare a list of the purchase orders and the names and the dates?

Mr Spencer: Off the record.

(Discussion outside the record.)

Mr. Spencer: I would suggest that he might add to it the outside diameter of the pipe, the weight per foot pounds, quantity, feet, total weight in tons, total price per ton, f.o.b. mill, total purchase price f.o.b. mill, that information. We have made up such a computation which we would be glad to hand to Mr. Hill for checking.

Mr. Lange: That would be fine, Mr. Spencer. That would give a complete picture of it and if you have that prepared—

Mr. Spencer: As a matter of fact, I have just found out we copied something that the witness had.

The Witness: It was taken from my working papers.

Mr. Lange: Mr. Spencer has it all compiled. If that checks out with Mr. Hill's figures we can use it.

The Witness: I think it is the same as shown on my working sheet that I let Mr. Roberts have.

The Trial Examiner: All that would be required would be to make copies of your working sheet?

The Witness: Yes.

Mr. Lange: That will give the actual picture.

The Trial Examiner: Very well.

By Mr. Lange:

Q. Now, on Exhibit 231-A, Mr. Hill, I just want to ask whether the Grade B seamless and electric weld pipe that you have set forth in that exhibit as compared with the lap-weld pipe represents an improvement in the art of pipe construction.

A. Yes, sir, it does.

Q. And manufacture, too?

A. Yes, sir.

Q. And the Grade B seamless pipe is largely used in

the industry at present as distinguished from the lapweld pipe?

A. The majority of pipe we analyzed from these pipe companies was Grade B seamless pipe.

Q. In these purchase invoices?

A. Yes, sir.

Q. And this computation that you made that is designated as Exhibit 231-A was made in connection with Exhibit 231?

A. I didn't understand you.

Q. This computation you made of Exhibit 211-A was made in connection with your Exhibit No. 231?

A. Yes, sir.

Q. The main distinction to be borne in mind, however, with reference to Exhibit 231-A is that it covers only pipe on the main line?

A. Yes, sir.

Q. And no laterals are included?

A. No, sir, just the main pipe line.

Mr. Lange: I believe that is all, Mr. Examiner, excepting that Mr. Hill is to check these various computations and if he finds any corrections or changes to be made either he or Mr. O'Connor will testify with reference to them.

The Trial Examiner: Do you have any further questions, Mr. Spencer?

Mr. Spencer: I have just two or three questions here.

The Trial Examiner: All right.

Recross Examination.

By Mr. Spencer:

Q. As a matter of fact, Mr. Hill, you have not utilized any quotations on Grade A lapweld pipe in your Exhibit No. 231?

A. No, sir, I haven't. It has all been electric weld and Grade B pipe.

Q. Why do you restrict Exhibit 231-A to the main line and eliminate laterals?

A. Well, the majority of the pipe was in the main line

and that is the only reason I didn't take into account the lateral lines.

Q. Is that the only reason?

A. I could have taken in the lateral lines. That is the only reason, though, the majority of the pipe is in the main line. A very small amount is in the lateral lines.

Q. You said that if you included 16-inch pipe in your pipe sizes you would have in excess of 88 per cent of your pipe purchases representing sizes between 16-inch and 24-inch pipe, is that correct?

A. Yes, sir according to our figures.

Q. According to the figures you have?

A. Yes sir.

Q. However, those figures and that percentage is restricted to your first class pipe, that is, it is limited to the classification you have between 10¾-inch pipe and 24-inch pipe?

A. Yes, sir, that is right.

Q. If you include all sizes of pipe in both classifications you would have a smaller percentage, would you not?

A. I think you would, yes, sir.

Q. Isn't it obvious you would?

A. Yes, sir, it is.

Q. Now, the percentage given for Canadian River Gas Company of 98.85 per cent is based upon all sizes of pipe without any split between the two classifications?

A. Yes, sir.

Mr. Spencer: That is all.

Mr. Lange: That is all.

The Trial Examiner: I wonder if we might not reserve Exhibit No. 231-B for the work sheet of Mr. Hill when it is presented?

Mr. Lange: I think that would be in line, Mr. Examiner, because we could then have them all together.

The Trial Examiner: Very well. As I understand it, Mr. Hill will be excused from the hearing?

Mr. Spencer: Yes, sir, that is agreed between counsel.

Mr. Lange: Yes, sir.

Before that, I would like to offer these two exhibits, being Exhibits 231 and 231-A.

Mr. Spencer: I have no objection to the Examiner passing upon the exhibits at this time, but I wish to object to the exhibits themselves as being irrelevant, immaterial and incompetent, particularly because the exhibits purport to reproduce and show the cost of reproducing an existing plant with a substitute plant which I feel has no bearing or foundation in law or any rate procedure regulations that I know of.

The Trial Examiner: The objection will be overruled and Exhibits Nos. 231 and 231-A will be received in evidence.

(Exhibits 231 and 231-A, Witness Hill, received in evidence.)

The Trial Examiner: I think perhaps, Mr. Spencer, if it is satisfactory, we might take up Exhibit 231-B. Could you have that available sometime this afternoon, Mr. Lange?

Mr. Lange: Yes, I think so.

The Trial Examiner: Off the record.

(Discussion outside the record.)

The Trial Examiner: On the record.

Mr. Lange: I will offer this exhibit at this time, Exhibit No. 231-B.

Mr. Spencer: I will make the same objections to the offer I made to Exhibits Nos. 231 and 231-A, Mr. Examiner.

(Vol. LXXX, pp. 11766-11823.)

The complainant, the City and County of Denver, did not offer evidence as to the cost of reproducing new the entire properties of the respondent as they now exist, but did offer, through its witness Tamblyn in his Exhibit 232 (Vol. LXXVII, p. 11260), estimates of the cost to reproduce certain buildings of the respondents by way of rebuttal to the estimates of the engineer Rhodes. This evidence of the City was the only evidence of the City, except copies of the annual reports filed by Colorado Interstate with the Sec-

retary of State of Colorado, abstracted supra, offered by it in support of its complaint. From 1914 to 1937, the witness was in business for himself as a general contractor constructing buildings of all types and sizes. He listed six large buildings including Colburn Hotel, ten stories; Cosmopolitan Hotel, twelve stories; and Continental Oil Building, ten stories, all in Denver, which he had constructed. At one time he conducted an evening school to give instruction in plan reading and estimating and in 1922 he published a book entitled "The Building Labor Calculator" (pp. 11263, 11264). In 1937 he was employed as an appraiser in the office of the Assessor of the City and County of Denver and was at the time chief appraiser in the city assessor's office (p. 11267).

He was instructed by the City on November 25, 1940, to check valuations placed on certain buildings of respondent as presented in Exhibits 68 and 70. He visited and inspected the buildings at Sullivan, Denver, Devine in Colorado and Bivins in Texas (p. 11268). He accepted Mr. Rhodes' material costs and labor scales as being correct. He assumed a contractor's profit of 10% (p. 11269). In his exhibit he shows for the Devine Station building $82,543 as against $110,643 in Exhibit 70. His figure for the Denver Meter Station was $11,912 against $20,910 in Exhibit 70. For the Sullivan Station he showed $26 as compared with $371 in Exhibit 70. Upon being questioned as to the breakdown of his several unit costs he answered: "It's all judgment." (Vol. CI, p. 15695). He visited the Dalhart Station but did not go to the Canyon Station. The general range of costs was fairly close throughout the period from 1927 to the present time (p. 15716). If the costs were greater from 1937 to date than they were in 1928, it would be due in part to less efficiency of labor and some raises in wages in some branches of work (p. 15715). He noticed construction work going on at the company's Devine Station but made no inquiry as to buildings of Canadian or Colorado Interstate recently built, although he knew another compressor station was being built at the time of his investigation (p. 15719). He did not make any inquiry as to the cost of such structures being erected at Dalhart during 1939 and 1940 (p. 15719). It would not mean anything to him if the Dalhart main compressor building was constructed in 1939 and

1940 at 23c per cubic foot, as compared with 12½c per cubic foot, arrived at by taking his cost and the cubic content of the Devine main compressor station. It would all depend upon how the cubing was done (p. 15720).

For dwelling No. 11, built in 1937 at Devine at a cost of $4,477, as shown on page 68, Exhibit 139, his valuation was $3009.

"Q. Now, then, the Devine five-room dwelling No. 11, built in 1937 at a cost of $4,477 as shown on Page 68, Exhibit No. 139, is next. The valuation you have placed upon that building is $3,009. In view of what you have said about the comparative cost of building construction between 1927 and 1928 on the one hand and 1937 on the other hand, does that mean anything to you, your $1400 under the actual cost?

"A. If your costs that you are talking about are based upon the kind of figures I find in this exhibit, it doesn't mean a thing to me.

"Q. The same thing would be true of Dwelling No. 12, which is a five-room house built in 1937 at Devine, cost $6576, shown on Page 68, Exhibit No. 139. With your cost of $4221, that still doesn't mean anything to you?

"A. It depends upon what you are including in cost. If you are paying a fancy salary and a lot of things I haven't considered as a part of the cost, it still doesn't mean anything to me. They are very cheap buildings, very cheap.

• • • • •

"Q. Just one other thing along that line is the Denver metering station. Your valuation is $11,912 and the book cost according to Exhibit 139 page 77, was $19-008.

"A. I am not figuring book cost." (pp. 15721, 15722.)

In the last five years he had only built two residences (p. 15724).

He never had any experience with gas pipe lines, and had never built a compressor station or any structure in connection with any compressor station (p. 15728).

His construction of the Cosmopolitan Hotel had not been profitable because it had been badly financed (p. 15730). He denied that he had underestimated that job or the Continental Oil Building job. He denied that he had overlooked a $25,000 item in estimating the Continental Oil Building job. "No, I didn't overlook it, but in adding up the figures, one sheet got out of the estimate and was not included in the total." (p. 15731).

"Q. How did it happen the surety company brought a suit against you and got a judgment against you in connection with that bond on the Continental Oil Building?

"A. They never brought a suit against me or a judgment or never asked me for a dime. They wrote me complimenting me upon the manner in which I had handled the job.

"Q. What was the name of the surety company?

"A. The American Surety Company of New York."

There was then marked for identification as Exhibit 310 a certified copy of witness' voluntary petition in bankruptcy. On objection the respondents withdrew the offer after the witness' attention was called to it and he then answered the questions as follows:

"Q. Mr. Tamblyn, I show you a document here marked for identification as Exhibit No. 310 and ask you if you have not listed there a judgment obtained against you by the American Surety Company in connection with the Continental Oil Building.

"A. Yes, it's coming back to me now." (p. 15734).

GEORGE M. TAMBLYN called as a witness by and on behalf of the City and County of Denver, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Gibson:

Q. State your name.

A. George M. Tamblyn.

Q. Have you had occasion, Mr. Tamblyn, to examine respondent's Exhibits Nos. 68 and 70 in this case?

A. Yes, sir.

Q. Have you been assigned by the City and County of Denver to go over the items shown on those exhibits?

A. I have.

Q. And you have made an estimate?

A. Yes, sir.

Q. What is your profession or trade?

A. Building contractor, appraiser and estimater.

Q. Have you prepared a statement showing your qualifications and experience?

A. I have.

Q. In connection with that statement, have you also included a written statement of the items shown in your exhibit?

A. I have.

Mr. Gibson: I would like to have this marked for identification as an exhibit.

The Trial Examiner: It will be marked for identification as Exhibit 232.

(Exhibit 232, Witness Tamblyn, marked for identification.)

By Mr. Gibson:

Q. Will you just read your statement, Mr. Tamblyn, into the record?

A. "Statement of Qualifications and Experience of Gordon M. Tamblyn.

"1. Name and Address: Gordon M. Tamblyn, 1108 South Steele Street, Denver, Colorado.

"2. Age and Place of Birth: Born in England, April 24, 1885; age 55 years.

"3. Education: 1888-1892: I received instruction at a private day school.

"1892-1900: I attended public school and passed the eighth standard (equal to twelfth grade in the United States).

"1900-1902: I was employed by a brick and stone con-

tractor assisting in various ways, and attended evening school.

"1902-1905: I was indentured as carpenter's apprentice for a four-year apprenticeship to David Tamblyn, contractor a cousin of my then deceased father. After serving three years my employer died and the business was dissolved. During this period I also attended evening classes in architectural drafting and other subjects which would advance me in the building and construction trade. During the period of 1900-1905 I was assisted in my studies by an elder brother who chose teaching as a profession.

"4. Employment: 1905-1906: I was employed as a carpenter and cabinet maker, at full journeyman's pay.

"1906-July 1907: I was a carpenter foreman in England; I came to the United States and located in Denver, Colorado, August 15, 1907, and have maintained residence here since that time.

"September 1907-1910: I was employed as cabinet maker and layout man in woodworking mill, and as detailed draftsman and estimator. During approximately two years of this period I was employed by McPhee and McGinnity Lumber Company, Denver's largest lumber dealers at that time.

"1910-1914: I was employed as chief estimator for Mr. Frank Kirchof now President of The American National Bank of Denver, who at that time carried on an extensive general contracting business. My duties consisted of making estimates on specially designed millwork and estimates on all types of buildings for bidding in competition. From the day I commenced work with this firm, I had full charge of all estimating, and contracts for complete buildings were secured and executed on the basis of my calculations.

"1914-1937: In 1914 I left this firm to enter business for myself, and continued in private business as a general contractor until 1937. My first contract was for the construction of a brick residence in the Country Club District in Denver. For some years I designed and built residences and other types of buildings of moderate size and importance, gradually increasing my business and executing con-

tracts for the erection of larger buildings. Some of the contracts I have executed and for which I furnished surety bond include the following:

	Approximate Cost
Boys' and Girls' Dormitory, Julesburg, Colorado	$80,000.00
Hearst Mercantile Building, Lead, South Dakota	$150,000.00
Colburn Hotel (10 stories) Denver, Colorado	$325,000.00
Cosmopolitan Hotel (12 stories) Denver, Colorado	$1,200,000.00
Norman Apartments (6 stories) Denver, Colorado	$370,000.00
Continental Oil Office Building (10 stories) Denver, Colorado	$1,000,000.00

"I have estimated the cost (and in some cases supervised the construction) of the following buildings for other contractors and architects:

Buckingham and Belmont Apartments
Country Club Apartments
Oxford Hotel
Albany Hotel
Erhard Hotel
Argonaut Hotel
Security Building
Midland Savings Building
Federal Office Building
Denver Post Office
State Office Building
Blayney Murphy Packing House
Ford Motor Company Factory
Children's Hospital
Presbyterian Hospital
St. Joseph's Hospital
Numerous Denver Public Schools
Fairmont Mausoleum
Great Western Sugar Company Warehouse.
All in Denver, Colorado;

Union Pacific Depot, Omaha, Nebraska;
Court House, Prescott, Arizona;
Oklahoma State Capitol (Plain and ornamental plastering);
Storage Warehouse and Apartment House, Billings, Montana;
Eleven Mile Dam (made models and estimated cost);
Other buildings of all types, too numerous to mention.

"I have also interested myself in improving and in teaching methods of estimating costs. In 1916 I opened an evening school to give instruction in plan reading and estimating. During the fall and winter of that year approximately eighty men, mostly building tradesmen, lumber men, contractors' sons, and others interested in the subjects, attended these classes.

"About the time the armistice was signed in the first World War, the United States Bureau of Vocational Training investigated the instruction I was giving in evening classes and, at its request I opened a day school and entered into contracts to instruct disabled soldiers in Estimating and Plan Reading. These men were sent to my school, 'The Western School of Estimating and Plan Reading,' from all parts of the United States and their tuition paid by the Government. These contracts were renewed for several years, and until such time as the number eligible for this training had dwindled to a point where it was uneconomical to continue the instruction.

"In 1922 I published a book entitled 'The Building Labor Calculator,' a system for estimating building costs. I have revised this book from time to time. Several thousand contractors, architects, engineers and others have purchased this book; and it has been sold in all parts of the United States, Canada, South America and in several foreign countries. Over forty universities and colleges have subscribed for this hand book.

"In 1923 I wrote a series of articles for 'The Contractor,' a trade journal published by the 'Association of Canadian Building and Construction Industries.' As a result of these articles and the widespread sale of my book 'The Building Labor Calculator' among Canadian contractors, I was in-

vited to address the Sixth Annual Convention of this Association, and spoke on two programs during the sessions January 23, 24, and 25, 1924, at Windsor, Ontario.

"At the conclusion of this convention a committee previously appointed to investigate methods of estimating building costs reported that the 'Tamblyn System' was the best they had discovered.

"In 1916 the Mountain States Telephone and Telegraph Company was compiling data for a rate hearing and had appointed a committee of four contractors to make a detailed appraisal of all its buildings in Colorado. This committee engaged my services and I made a detailed list of materials and labor for these structures. The pricing was done by the committee.

"Some few years ago I was engaged to make an appraisal of the Daniels and Fisher Stores Building, in Denver, in a case involving inheritance tax. This building was constructed in sections at different periods. The costs were estimated as of the years the various sections were constructed.

"Present Employment:

"In February 1937 I was employed as appraiser in the office of the Assessor of the City and County of Denver. At the present time I hold the position of Chief Appraiser. My duties require me to appraise real estate improvements for tax purposes. The work in this department involves the appraisal of almost every type of building construction. When disputes arise in valuations involving recently built structures, it often becomes necessary for me to check actual construction costs. It is obvious, therefore, that the work in which I am now employed affords me an unusual opportunity to keep posted on current construction costs over a wide field. I have recently prepared a manual of building costs for the use of my department.

"To summarize: My thirty-eight years of experience covers work as apprentice, journeyman, foreman, superintendent, contractor, estimator, appraiser, and instructor in connection with almost all types of building construction.

"Written Statement of Gordon M. Tamblyn.

"On November 25, 1940, I was assigned by the City and County of Denver the task of checking the valuations placed on various structures of Canadian River Gas Company and Colorado Interstate Gas Company by the engineering firm of Ford, Bacon and Davis, Inc., as presented by Mr. George I. Rhodes, in exhibits 68 and 70 in this case. Since that date I have visited the major stations of these companies and made careful inspections of the buildings and structures found at the following locations:

"Regulator Station at Sullivan, Colorado;

"Metering Station at Denver, Colorado;

"Pumping Station at Clayton, New Mexico;

"Pumping Station at Dalhart, Texas; and

"Pumping Station and Gasoline Plant at Bivins, Texas. It was determined from these inspections that buildings used for the same function were generally of similar construction and type at each location. Therefore, an analysis of the cost of a structure of a certain type, if properly used, will serve as a yardstick for determining the cost of other similar structures at that and other locations. I have prepared cost estimates on selected structures erected at the following locations:

Sullivan, Colorado; Denver, Colorado; Devine, Colorado; and Bivins, Texas.

"In my investigation and compilation of costs I have had access to and have made use of the following information:

"(a) Rhodes' material and labor rates.

"(b) Rhodes' unit costs, including materials and labor.

"(c) Rhodes' reproduction costs shown in Exhibits 68 and 70.

"(d) Inspection of structures as erected on the sites.

"(e) Plans of certain structures.

For the purpose of comparison I have accepted Mr. Rhodes' material costs and labor scales as being correct;

however, my application of these costs and rates to the inventoried quantities in the structures under consideration, varies widely from those of Mr. Rhodes.

"In order to simplify comparison with Mr. Rhodes' costs, I have followed the Rhodes' theory of reproduction and method of presentation. For example, I have assumed that the work is to be done by contractors who are to be allowed liberal funds to cover the cost of doing high-class work and a contingency fund to safeguard against any possibility of loss, plus a ten per cent profit. Wherever, due to lack of plans, or the use of plans which were incomplete, or whenever there was insufficient data for any other reason to determine quantities, I have accepted the Rhodes' inventory. In many instances I have omitted from analysis entire structures because of lack of information on which to base an accurate estimate.

"The estimates of costs and comparisons referred to in the foregoing statement are hereto attached and designated as follows:

"Bivins Station—Texas.

"Devine Pumping Stations—Colorado.

"Denver Metering Station—Colorado.

"Sullivan Regulator Station—Colorado.

GORDON M. TAMBLYN,
Chief Appraiser, Assessors's Office, City and County of Denver, Colorado."

Q. Mr. Tamblyn, I notice in the statement on Page 7 of this exhibit you state:

"For the purpose of comparison I have accepted Mr. Rhodes' material costs and labor scales as being correct; however, my application of these costs and rates to the inventoried quantities in the structures under consideration, varies widely from those of Mr. Rhodes.

"In order to simplify comparison with Mr. Rhodes' costs, I have followed the Rhodes' theory of reproduction and method of presentation."

Mr. Tamblyn, that being the case, to what do you attribute the differences shown in your estimates and those of Mr. Rhodes?

A. I stated in this exhibit I have accepted the market price of Mr. Rhodes for materials and the labor scale, or the rate per hour for labor employed in this work. The difference results from the number of hours applied to the various parts of the work and the amount of materials necessary to do that work by Mr. Rhodes, making a difference in the inventory quantities that I get and those of Mr. Rhodes multiplied by the same scale of wage and the rate of materials, or the cost of materials, results in the differences appearing in the exhibit attached.

Q. When you speak of the number of hours, what kind of hours were you—

A. That is one difference in instances where the Rhodes' breakdown on their unit costs show only hand labor. I have used either mechanical or team power.

Q. What about the materials?

A. The materials—speaking from memory, not referring to my itemized breakdown—as a comparison occurs in the amount of lumber required to build forms for the class of walls and foundations found in these structures. I think I can quote from memory that in instances where Mr. Rhodes shows three board feet per square foot, I consider two board feet ample for the work. In other instances where three and a quarter feet per square foot of forms are used, I vary again and use about two-thirds of that material and have always done so in my practice.

There is another item in form work where I think Mr. Rhodes uses 15 pounds of wire per square foot of wall, I consider 3-½ pounds ample of wire and nails, I should say —ample to do the work. That is merely an illustration of differences which occur. That is in temporary work which is necessary to pour the concrete walls.

Another instance I remember without referring to my detailed estimates drawn across Mr. Rhodes' breakdown, in the Bivins station I find 13-inch walls, a wainscot of 13-inch walls from the concrete foundation to the bottom of the window sills in which Mr. Rhodes has applied his unit cost of press brick, or face brick to the entire wall,

whereas only two-thirds of the wall is a press brick and the other two-thirds is of common brick. Some difference occurs there.

In one item the putting on of 26-gauge corrugated iron—and I am quoting from memory, and I believe it is correct—Mr. Rhodes uses two hours—just a minute. Make this clear. To lay 100 square feet or apply 100 square feet of corrugated iron, 26 gauge, Mr. Rhodes, uses two mechanics—skilled mechanics—one hour each, two semi-skilled, one hour each, and two helpers one hour each. I differ very widely from any such use of labor doing this kind of work.

Q. These differences seem to prevail to the whole number of items shown on Exhibits 68 and 70, do they not?

A. That is right. I should like to make one more reference and then if I am going to be examined on the details, I would like to go back to my files and get the detailed figures. I didn't know I was to be called this morning. I thought it would be tomorrow or the next day and I wasn't prepared; however, I want to quote one other difference.

In the excavations for the compressor buildings that are large excavations varying from approximately 80 feet to 137-some odd feet long and possibly 8 to 9 feet in depth, large areas in the breakdown of the cost applied to these structures where only common labor is used with a hand shovel and the unit cost is excessive, naturally. No such methods have been used in my time that I know of to do such work.

Q. Mr. Tamblyn, on December 19, 1940, Mr. Rhodes made a statement on the witness-stand in this case that his breakdown on this pipe line was not as accurate as his breakdown on the buildings. Assuming that statement to be correct, what in your opinion would be the minimum excess resulting from his breakdown on the pipeline?

A. Well, if the pipe line is figured less accurately than this, naturally the difference would be greater than the differences shown in my exhibit in the same direction.

(Vol. LXXVII, pp. 11260-11273.)

TOTALS				$1,134	$367	$767	209.0

22. **Working Capital of Colorado Interstate.**

The witness Rhodes, who participated in the management of the respondent's business for some years after his firm (FB&D) had constructed the line, and whose firm has managed many other natural gas pipe lines, estimated in his Exhibit 70 (Vol. XII, p. 1710) the minimum working capital requirements of Colorado Interstate. He determined that $120,000 was the minimum requirement for this purpose at this time. The formula adopted by him was stated as follows:

> "Working capital for Colorado Interstate's property included in this exhibit has been determined in accordance with a commonly accepted formula as the sum of (a) the average book cost of materials and supplies on hand, (b) one-eighth of the annual cash expenses for operation and maintenance of the property and (c) a cash working fund equivalent to the minimum cash balances carried with local depositories. In the actual operation of Colorado Interstate directed from Colorado Springs only small working cash balances are maintained with local depositories. Cash not needed for current operations is transferred to the New York office in the form of a demand account subject to withdrawal by the Colorado Springs office when needed. The net current position shown by Colorado Interstate's field balance sheet, as reported from Colorado Springs, is thus indicative of the actual working capital required. The average net current position reflected in Colorado Springs balance sheets for the 3-year period 1936 to 1938, inclusive, was greater than the working capital indicated as needed by the formulae. The amount so determined, of $120,000, is a minimum requirement and less than the working capital actually required by Colorado Interstate." (p. 1738).

Applying this same formula and using "the five year moving average of supplies and expenses, cash in local banks and one-eighth of the annual operating costs exclusive of purchased gas" (Exhibit 170, p. 1), the witness Lusk extended the necessary working capital of Colorado Interstate for the Denver Line as it exists and for a resale line only, as follows:

Year	Denver Line All Gas	Denver Line Resale Gas Only
1940	$127,000	$129,000
1941	134,000	133,000
1942	142,000	140,000
1943	150,000	147,000
1944	151,000	148,000
1945	153,000	149,000
1946	154,000	150,000
1947	155,000	151,000

(Exhibits 170, Statement 2; 172, Statement 2; 285, Statement 4; and 286, Statement 4; Lusk, Vol. XLVIII, p. 6611.)

Cross-examination of the Company's Witness, RHODES.

Q. You don't remember specifically what you told him to do about any of the details, do you?

A. No, I don't recall anything except the broad instructions to determine the working capital on this formula which he well knows and which we have used repeatedly in the past.

Q. What is the average lag in days between the date of delivering gas to the customers and the date the customers are required to pay for such gas?

A. I don't know.

Q. Did you take that into consideration when you attempted to determine what amount of working capital this company would have to have on hand?

A. No.

Q. Doesn't that make some difference?

A. I took all of the factors into consideration when I found the net current assets of the company were in excess of the working capital which was determined by this formula, which as I say, gives the minimum working capital.

Q. Did you know that some of these customers' bills accrued in advance—I will withdraw that question.

Mr. Campbell: I would.

Mr. March: Strike that question, Mr. Reporter.

Q. You don't know anything about the accrual of the bills of these companies?

A. No, I am not interested in that. I don't think that you can make any practical determinations of the amount of working capital by any such estimate of time lag and so forth. The actual experience in the operations of properties shows that you require more capital than indicated by any such study.

Q. Oh, so you are—I thought you weren't relying upon the actual experience of the company.

A. As related to this working capital it is perfectly obvious that I am basing it upon what this company has found by experience as being required to operate this property.

Q. Not the experience which had been secured at the time of the beginning of the operation?

A. There is no direct relation between the working capital that would have been required in 1928 and that which is required now for the properties that now exist.

Q. Do you know when royalty payments are due and payable?

A. I don't know. I would have to look at the leases.

Q. Did you take that into consideration in making provisions for working capital here?

A. No, I merely took into consideration that they are paid and how much is paid.

Q. You don't know anything about that?

A. Well, I wouldn't put it quite that bad, but I don't know when they are due on the calendar.

(Vol. XIV, pp. 1962-1964.)

• • • • •

Q. Do you know, Mr. Rhodes, the amount of time which has elapsed between the accrual of tax expense on the books and when they are actually paid in cash?

A. What taxes are you referring to?

Q. Advalorem and income taxes.

A. What?

Q. Advalorem and income taxes.

A. The only separate item of taxes that appears here are the severance taxes and the like which are paid monthly.

(Vol. XIV, p. 1966.)

• • • • •

Redirect Examination.

By Mr. Campbell:

Q. Mr. Rhodes, did I understand you to say on cross-examination that your formula for obtaining working capital in reproduction costs new was that such working capital was equivalent to one-eighth of the ordinary average expense plus average cost of materials on hand plus average cash on hand, is that substantially correct?

A. No. It is the minimum cash balance required rather than average cash.

Q. Now, on cross examination there has been developed that your assistant, Mr. Lusk, in figuring up the expenses of Colorado Interstate Gas Company and Canadian River Gas Company for the last five years, I believe, has eliminated certain extraordinary expenses. Is that correct?

A. Yes, that is so.

Q. I believe on cross examination it was developed that there has been eliminated all of the expense of the Colorado Interstate Gas Company that it has been put to in this rate case, for example. Is that correct?

A. That is correct.

Q. That is also true with respect to the Canadian River Gas Company?

A. Yes.

Q. I believe it was also developed on such cross examination that Mr. Lusk, your assistant, eliminated all lease facility expense?

A. That is right.

Q. Now, under your formula, does not the elimination of such expenses directly reduce the working capital?

A. Well, this leased property expense was in no way related to the Denver line.

Q. I will put it another way:

If these items which have been eliminated were included, would not that increase the working capital requirement?

A. The working capital requirement calculated on this formula, if they were included, would give a higher figure, yes.

Q. Is it not so that the working capital goes up one dollar for every twelve dollars of expense that you have included in the formula?

A. No, every eight dollars.
Q. Every eight dollars?
A. Yes.
Q. I beg your pardon.

Then your working capital has in effect been reduced by reason of these eliminations which have been testified to?

A. Yes, and in effect it excludes those expenses not related to the Denver line.

Q. If, for example, the expenses of this rate case and these attorneys' fees about which so much objection was made here were included, it would be included in the working capital?

A. That is right. It would result in a higher figure

(Vol. XIV, pp. 1967-1969.)

The Commission offered evidence through its accountant, Kenneth L. Smith, in his Exhibit 145 (Vol. XXXVII, p. 5110), of his estimates as to the necessary working capital required for the line as operated for the sale of all gas as shown for the year 1939, in the sum of $109,065 (pp. 5112, 5113).

Docket G-127

Schedule 1
Sheet 1 of 3

COLORADO INTERSTATE GAS COMPANY
WORKING CAPITAL REQUIREMENTS
BASED ON OPERATIONS DURING THE YEAR 1939

Line No.	Particulars (1)	Note (2)	Total	Transmission: Other Transmission System (4)	Transmission: Compressing System	Distribution (5)
1	Materials and supplies (average monthly balance during the year 1939)		$ 57,000.00	$37,994.73	$17,342.10	$ 1,963.17
	Operating revenue deductions, as adjusted by Examiner of Accounts:					
2	Gas purchased (Note 1)					
	Operating expenses	$425,013.63				
3	Less gas used in operations (Note 1)	13,374.21				
4	Balance	$411,639.42				
5	12½% of above, representing 45 days' operations (Note 2)		51,454.93	21,910.84	21,202.64	8,342.05
	Depreciation (Note 3)					
	Taxes (Note 4)	$45.19				
6	Nonrecurring expenses					
7	12½% of above, representing 45 days' operations (Note 2)		5.65			5.65
	Other items (Notes 5 and 6)					
8	Total working capital requirements		$108,064.24	$59,905.57	$38,754.74	$10,305.87

Notes:

(1) No allowance is made for gas purchased because revenue from the sale of that gas is, on the average, received before the gas is paid for by Colorado Interstate Gas Company.

Payments for gas purchased are due Canadian River Gas Company from Colorado Interstate Gas Company monthly, on the twenty-fifth day of the month succeeding the month in which the gas was delivered to Colorado Interstate Gas Company. Accordingly, on the assumption that customers of Colorado Interstate take gas in equal daily quantities, thus making the equated date for the delivery of the month's supply of gas to them the fifteenth of each month, payments are due Canadian River Gas Company, on the average, forty days after that company makes delivery to Colorado Interstate

Revenue - See Schedule No. 2 for computation of lag in payment of bills by customers — 11.4a.s

after delivery of gas to them

Number of days, on the average, that cash is due from gas sales before payment is due for gas purchased — 51.8a.f

(2) An amount equal to 1/8 of the company's operating expenses for 1939, or forty-five days' expenses is, in the Examiner's opinion, a liberal allowance to cover operating expenses which must be paid in the interval between the time of initial rendition of service and the time when revenue is received. The amount of operating expenses, $425,013.63, is taken from Exhibit No. [illegible] of a report on this company entitled "Income Accounts and Supplemental Data"

(3) No allowance is made for depreciation since this expense does not necessitate the disbursement of cash or the use of working capital.

COLORADO INTERSTATE GAS COMPANY
WORKING CAPITAL REQUIREMENTS
BASED ON OPERATIONS DURING THE YEAR 1939

2

Notes (Cont'd):

(4) No allowance is made for taxes in working capital, as revenues are realized in cash considerably in advance of the payments of taxes, as shown in the following tabulation relating to 1939 taxes:

Date Paid		Amount
March	1939	$ 15.00
April	"	2,678.61
May	"	21.30
July	"	2,677.48
August	"	4,495.00
October	"	2,827.56
November	"	12,281.28
December	"	2.00
Subsequent year (1940)		589,949.54
Total taxes for 1939, as adjusted		$614,947.77

(5) No allowance is made herein for the average value of gas in the transmission lines, for the reason that the Respondent has capitalized in its plant account the amount of $7,212.75, representing the value placed upon 81,043.4 MCF used in testing, blowing and/or packing the lines, as follows:

Year	MCF	Rate per MCF	Amount Capitalized	Pressure Base
1928	66,043.4	$ .0865	$5,712.75	16.4 pounds per square inch, absolute
1929	15,000.0	.10	1,500.00	Not indicated
	81,043.4		$7,212.75	

According to information received from the Bureau of Engineering the average line pack during the year 1939 was 55,362 MCF, at a pressure base of 16.4 pounds per square inch absolute.

(6) No allowance is proposed for minimum bank balances for the following reasons:

(a) A substantial average balance is provided by reason of the lag in payment of gas purchased for resale and taxes after the average date of receipt of revenues.

(6) (b) An examination of the company's records indicates that the majority of its customers actually pay several days in advance of the due date, thus providing in fact an additional source of funds for bank balances.

(c) A small duplication in the proposed allowances for material and supplies stock and operating expenses exists, to the extent of 12½% of the charges to operating expenses from the material and supplies accounts.

Docket G-124

Schedule 2
Sheet 1 of 1

COLORADO INTERSTATE GAS COMPANY
CALCULATION OF WEIGHTED AVERAGE LAG, IN DAYS, BETWEEN THE DATE OF DELIVERY OF GAS TO CUSTOMERS AND THE DATE WHEN PAYMENT FOR THAT GAS IS DUE
BASED ON 1939 REVENUES

Line No.	Customer (1)	Last Day of Billing Period (2)	Date Due in Following Month (3)	Lag in Number of Days Between the Time of Delivery of Gas to Customers, as Equated, and Date when Payment for that Gas is Due (a) (4)	Revenue for 1939 (5)	Dollar Days (6)
1	American Crystal Sugar Company	30th	20th	35	$ 40,432.06	1,415,122
2	Arkansas Valley Natural Gas Company	30th	20th	35	20,380.64	713,322
3	Atchison, Topeka and Santa Fe Railway Company	30th	20th	35	56,891.16	1,991,190
4	Citizens Utilities Company	15th	20th	50	50,470.68	2,523,534
5	City of Colorado Springs	30th	15th	30	212,957.45	6,388,723
6	Colorado Fuel and Iron Corporation	30th	10th	25	986,636.44	24,665,911
7	Colorado Portland Cement Company	30th	20th	35	193,109.10	6,758,818
8	Colorado-Wyoming Gas Company	25th	20th	40	495,450.81	19,818,032
9	Natural Gas Pipe Line Company of America	30th	27th	42	1,376,259.49	57,802,898
10	Public Service Company of Colorado	25th	20th	40	2,124,745.69	84,989,828
11	Pueblo Gas and Fuel Company	25th	20th	40	157,572.31	6,302,892
12	U. S. Department of Interior - Bureau of Mines	30th	20th	35	440.40	15,414
13	Veterans Administration	25th	20th	40	48,876.94	1,955,065
14	Totals				$5,764,222.47	215,340,749
15	Weighted Average Lag, in Days			37.		

(a) This lag consists in the number of days between the last day of billing period (Column 2) and date due in following month (Column 3), plus fifteen days as determined on the basis of the assumption stated in Note 1 of Schedule 1.

EXHIBIT No. 115

1653

[Testimony of Witness, Kenneth L. Smith.]

Q. Mr. Smith, in connection with the preparation of that exhibit I will ask you whether you prepared a written statement which sets forth in a summarized form the principal points in that exhibit?

A. Yes, I have.

Q. Will you please read that statement into the record, Mr. Smith?

A. "This study was made for the purpose of determining working capital requirements of Colorado Interstate Gas Company and is based upon operating figures for the year 1939 because they are believed to be indicative of present conditions. It consists of two schedules.

"Schedule No. 1, which develops a working capital requirement of $109,064.98, allocable to the company's transmission and distribution operations, is with its notes self-explanatory.

"Schedule No. 2, which is a computation of the number of days lag between the time of delivery of gas to customers and the date when payment for that gas is due, helps support the conclusion stated in Schedule No. 1, that revenue from the sale of gas is received before that gas is paid for. It, too, is self-explanatory."

Q. Now, in connection with the preparation of this Exhibit No. 145, Mr. Smith, as I understand it, the basic figures utilized were taken by you from the company's books and records?

A. That is correct. I might add to that and say that the adjustments employed by Mr. Early in his Exhibit No. 140 were, of course, taken into consideration by me in arriving at these results in this exhibit.

Q. And the results arrived at by you in this exhibit reflect in your judgment the correct result—strike out "result"—the correct amount that should be set forth for working capital of Colorado Interstate Gas Company in connection with this investigation?

A. Yes, in my opinion it is a liberal allowance for working capital requirements based upon operations for the year 1939.

Q. I note in the title sheet of this exhibit that it bears the approval of Mr. Harold Tomlin, Examiner in charge of regional office, and W. E. Baker, Chief accountant.

Both of these men are occupying those positions on the staff of the Federal Power Commission?

A. Yes, that is right.

Mr. Lange: That is all.

Cross Examination.

By Mr. Brock:

Q. Mr. Smith, in your statement you refer in the second paragraph to the company's transmission and distribution operation—just a minute. I am confused here.

The copy of the written statement which you read has Canadian River Gas Company up at the top of it. Was that merely to identify the document?

A. Yes, "Canadian River Gas Company" is there and "et al" is also there if you will notice it.

Q. Oh, yes. So this is intended for the Colorado Interstate Gas Company?

A. Yes.

Q. Now, then, what do you mean by the term "Distribution Operation" in connection with the Colorado Interstate Gas Company?

A. Well, I adhere to the same principles that Mr. Early explained in connection with the expenses that he classified as distribution. They relate to the company's measuring system.

Mr. Lange: Right there I wish to ask you this: They are classified in conformity with the Uniform System of Accounts for natural gas companies?

The Witness: Yes.

By Mr. Brock:

Q. In his exhibit and testimony he applied that term in connection with the expenses for the metering stations and you have the same thing there?

A. Yes, the metering stations, and in some of those contributions that were made for property on customers' premises which discussed in detail with him. Inasmuch as I have used his expenses as a basis—any of the explanations he made with respect to distribution expenses follows through in my exhibit.

Q. When you refer to "customers' premises," you have in mind just what he explained in connection with his exhibit?

A. Yes, sir, those are identical matters.

Q. Is this $109,064.98 an amount you arrived at as proper working capital for the company?

A. Yes. I described it as a liberal allowance for working capital based on the 1939 operations.

Q. Do you think that is more than you would need if you were operating the company?

A. I believe that is all that anyone would need.

Q. How did you arrive at that amount?

A. Well, it is shown on Schedule 1, which is Page 1, that is the summary. You might follow in Column 2 there. I show the amount of $57,604.40 as being the amount which the company requires for its stock of material and supplies—

Q. May I interrupt you right there?

A. Yes, sir.

Q. You refer to the average monthly balance. What does that mean? Does that take the end of each month or the beginning of each month, or how did you figure that?

A. Well, the company strikes monthly balances at the end of each month and this figure represents a summation of all of the monthly balances at the end of each month in the year 1939 and then it is divided by 12, giving the average monthly balance.

Q. So aside from your average it is a matter of the company's own books?

A. This is based upon the company's book figures, as I recall, without any adjustments. I do not believe—I am sure Mr. Early did not make any adjustments, and in applying this figure I didn't make any adjustments, so it is based exactly upon the company's experience.

Q. This amount that you have classified under Columns 3, 4, and 5, is that correct as between other transmission systems, compressing stations, and distribution?

A. Yes, sir, that total is broken down and those three columns are to identify the components of the total with the function of the company with which those materials and supplies are identifyable.

Q. Are those three items which make up the total under column 2; $57,604.40 on the books of the company, too, or, did you make the allocation some other way?

A. I am not sure that I understand your question exactly. Of course the items are on the books of the company and they have been described on the books of the company, and information which was available enabled me to put them in those three columns.

Q. Well, I was just wondering whether you found information on the books as to the three exact amounts under Columns 3, 4 and 5, or whether you made some sort of an allocation of your own as between the three branches of the business?

A. Well, I took the stock account, that is, the underlying accounts for the $57,604.40, and I put them in the three pockets in accordance with according to what I could find out as to the amounts which were represented in the warehouse or stock accounts on the company's books.

If you mean whether or not they are labeled within the three pockets on the company's books, why, that is not exactly the way the figures appear there, but there was information on the company's books which enabled me to put the amount in these three pockets.

Q. In other words $17,552.10 shown under Column 4 was the proportion of the total amount of $57,604.40 which you considered to be the materials and supplies properly applicable to the compressing system?

A. Yes, sir.

Q. And, likewise, with those other two items under Columns 3 and 5?

A. Yes, sir.

Q. But those three figures under Columns 3, 4 and 5, as I understand it now, didn't appear on the books of the company and the headings which you have used here?

A. No. For instance, you wouldn't find an account, or a sub-account, for compressing system materials and supplies that had that amount of $17,552.10 in it. I had to group certain accounts to get that.

Q. What was the purpose of making this separation as between two branches of the business in your effort to work out working capital?

A. Well, I felt as though it gave anyone who might use this schedule a better idea of how this working capital actually applied to the functions of the company. The plant account is naturally broken down by functions and so it follows logically, it seems to me, that the working capital should also be broken down by functions.

Q. Is this $57,604.40 the same figure used by Mr. Rhodes, or do you recall his testimony on that?

A. I couldn't answer whether or not it is the exact figure, but I do recall, having reviewed Mr. Rhodes' exhibit and his testimony, that there isn't any substantial difference in the results so far as that figure is concerned.

Q. Now, the next item under Column 1, will you explain to us what is involved there?

A. Well, I was in the process of showing how I arrived at the total of $109,000 and explained the $57,604.40, and I find that the next item in Column 2 is on Line 5, the amount of $51,454.93 representing approximately 45 days operating expenses. That is the next item making up my total, and then there is only one other item, a very small one, in the amount of $5.65 which represents 12-½ per cent of the very small item of non-recurring expenses for the year 1939.

Q. Now, will you go back and explain the use or significance of the other figures appearing to the left of Column 2?

A. What line is that?

Q. Line 2.

A. All right, on Line 2 I show the operating expenses for the year 1939 were $425,018.63.

Q. Now, is that per books or does that involve some adjustment which you or someone else has made?

A. That involves an adjustment. My Note 2 is an explanation of that. I think the last sentence in Note 2 on that page answers your question. It says, "The amount of operating expenses, $425,018.63, is taken from Schedule B-1—" that should be Statement B-1— "— of a report on this company.

Q. Just a moment.

Mr. Lange: Will the Examiner instruct the reporter to make that correction?

The Trial Examiner: Yes, Mr. Reporter, will you make that correction, please? That is on Page 1 of Exhibit No. 145.

By Mr. Brock:

Q. All right, read on.

A. "— of a report on this company entitled 'Income Accounts and Supplemental Data'."

Q. What exhibit is that?

A. That is Exhibit No. 140 which was sponsored by Mr. Early.

Q. And you took his adjusted figure for the purposes of this exhibit of yours?

A. Yes, sir. I might say, referring back to Exhibit No. 140, on the front title page, that you will notice my signature appears under Mr. Early's on that title page, and that indicates that I was supervising Mr. Early's work at the time his Exhibit No. 140 was prepared and completed; and that I, of course, knew all of the adjustments that he made and that I approved of them, as well as the approval that was given by Mr. Tomlin and Mr. Baker.

Q. All right. From that figure showing the operating expenses as adjusted, you subtract $13,379.21 representing gas used in operations and you get $411,639.42. What do you do with that in working out the amount for working capital?

A. That amount of $411,639.42 is divided by 8, or it is multiplied by 12-½ per cent, whichever way you want to do it, to arrive at the figure in Column 2, Line 5, which is $51,454.93.

In other words, in Column 2, there is a sum of $51,454.93 that represents approximately 45 days operations rather than the full year.

Q. You took the eight months?

A. No, sir, 45 days. I took one-eighth, or approximately 45 days. I am saying in effect that what the company needs in its working capital requirements with respect to its operating expenses is enough money to provide for a 45-day operation which is a liberal allowance, before that company receives its revenue that it earns.

Q. That is, 12-½ per cent?

A. Yes, sir.

Q. Of the operating expenses?

A. 12-½ per cent, or one-eighth of the operating expenses for the entire year, or that means in effect approximately 45 days operation.

Q. What is the significance of the 45 days which you used? Why did you use 45 days rather than some other number of days?

A. Well, we can look at Note 2 again, the first sentence, and you will find it sums up the situation. I might read that. It states: "An amount equal to 12-½ per cent of the company's operating expenses for 1939, or 45 days expenses of operation, is, in the Examiner's opinion, a liberal allowance to cover operating expenses which must be paid in the interim between the time of initial rendition of service and the time when revenue is received."

Now, I think to clarify that note it might be well to go back to Note 1. The import of Note No. 1 is that—

Mr. Lange: It might be well, Mr. Smith, to explain the allowance, or, rather, the absence of any allowance in working capital for any gas purchase amounts—

The Witness: That is clarified in Note 1 and too Note 1 covers that point as well as showing why 45 days allowance for operating expenses is a liberal allowance.

Mr. Brock: Mr. Examiner, if that is a convenient place to take the afternoon recess, I will read this note.

The Trial Examiner: Very well, we will stand in recess for five minutes.

(Whereupon, a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

By Mr. Brock:

Q. Now, Mr. Smith, in your Note 1 on Page 1 of your exhibit you indulge in the assumption that customers of Colorado Interstate Gas Company take gas in equal daily quantities. What is the significance of that and what do you mean by that?

A. Well, that means as to any particular month's de-

livery the assumption is made that the average day for the month would be one-thirtieth of the total for the month. That's in effect what it means, I believe. That is, the average daily consumption by the customers would be equal to one-thirtieth of the total consumption for the month. In other words, it is an assumption that is necessary in order to arrive at an equated delivery for the month's supply of gas sold.

Now, that doesn't mean any particular month, that means an average month for the year.

Q. What difference does it make whether a particular customer takes all of its gas in the first half of the month or whether it is spread out throughout the month?

A. Well, I think maybe a better way to understand that is to turn over to Page 4 of the Exhibit.

Q. All right.

A. Because on that Page 4 which is designated Schedule 2, I have made a calculation of weighted average lag in days between the date of delivery of gas to customers and the date when payment for that gas is due, based on 1939 revenues.

Now, my columns in that schedule are headed up so as to show in Column No. 1 the customer, Column No. 2 the last day of the billing period and in Column 3 the date due in the following month. In other words, that is the date which the customer's bill is due and should be paid to Colorado Interstate, and then in Column 4 it is headed "Lag in number of days between the time of delivery of gas to customers, as equated, and date when payment for that gas is due." That column has a foot-note which is at the bottom of the page which reads as follows: "This lag consists in the number of days between the last day of billing period (Column 2) and date due in following month (Column 3), plus fifteen days as determined on the basis of the assumption stated in Note 1 of Schedule 1," and I might take one of those figures in Column 4, for instance, Line 1, and show just how that is arrived at.

From the last day of the billing period, which is the 30th of the month, Column 2, to date when the payment is due in the following month Column 3, which is the 20th of the following month, which, of course, is 20 days—

Q. Ten days?

A. Twenty days. And then we add to that, 15 days which is the difference between the last day of the billing period and the middle of the billing period—the middle of the month. Fifteen days added to the twenty days gives you 35 days, shown in Column 4. Now, it is necessary at that point to have some knowledge of the average equated date when the gas is actually delivered to the customers. In other words, going back to Column 2, here is the 30th day of the month and that is the last day of the billing period. The customer has been taking gas for thirty days. He didn't take all of that gas on the first day or the last day, but he took it in a series of days.

Now, there is some day in there that is the average date on which he took that gas. The most logical assumption I could make was that his average date of take was the middle of the month—the middle of the period—but to arrive at that result you have to assume that on the average for the period of the year, the customer would take his gas in equal daily amounts. Of course, it would average out into the total amount.

Q. This equated business that you refer to there under Column 4, that is the fifteen days in each case added?

A. Yes, it would be fifteen days from the last day of the billing period because every customer is billed once a month and it would, therefore, be fifteen days from the end of the billing period—fifteen days prior to the last day of the billing period.

Q. In other words, you have added fifteen days to the several dates set out under Column 3?

A. Well, I have added fifteen days to the difference between—I have added fifteen days to the number of days from the date in Column 2 to the date in Column 3.

Q. Oh, yes. That's what I intended to find out. That is true in each case here?

A. Yes, sir, that is correct.

Q. That is what you mean by equated, is adding fifteen days to the number of days between the end of the billing period and the date when the bill is due?

A. Yes. In other words, the equated date is the middle of the billing period.

Q. Is that your own formula, or—or did you get it from some other source?

A. Well, I believe that this method has been used by a good many regulatory bodies in this sort of study.

Q. Have you ever used it before?

A. I have never used this method before myself.

Q. Do you know of any cases? Could you cite us any cases where that formula has been adopted or approved by regulatory authority?

A. Not right at the moment, but I do know that I am familiar, in having studied this subject, that such a method or one that yields the same result has been used.

Q. Under Column 5 you set out the revenue, I assume it is, from the several customers of the Colorado Interstate Gas Company listed under Column 1?

A. Yes, that is the annual revenue for 1939. I think that that figure also will tie in with Mr. Early's exhibit.

Q. In other words, there is included in the figures under Column 5 some adjustments in connection with the revenue?

A. I don't believe Mr. Early had any adjustments. He applied some reclassification entries, but I don't believe he had any adjustments.

Q. And under Column 6, how do you arrive at the dollar days?

A. The dollar days in Column 6 is the result of multiplying Column 4 by Column 5; that is, with respect to each individual item, of course, in Lines 1 to 13, inclusive.

Q. How did you determine under Line 15 the weighted average lag? In other words, how did you arrive at the figure 37 under Column 4?

A. Well, it is arrived at—not by the use of the figures in Column 4, but by striking the average, using the figures, the totals in Columns 5 and 6 on Line 14. In other words, the average lag for all of the revenue is related to the total dollar day, an average of 37 days.

Q. In other words, you took the several days listed under Column 4, weighted it by the dollars shown in Column 5 and 6?

A. Yes, that is the purpose. Column 6 actually weights the revenue. The dollars of revenue and the days, involved in the lag, that waiting is automatic in the product arrived at in Column 6.

Q. Coming back to Page 1 for a moment, under Note 2 you say it is the Examiner's opinion that an amount equal to 12-1/2 per cent of the company's operating expenses for 1939 are 45 days' expenses of operation, is a liberal allowance.

A. Are you ready for me to answer?

Q. No, I was going to ask you what you based that on.

A. Well, if I had wanted to be unliberal I could have said 37 days and by using 45 which is 8 days more than the weighted average lag in revenues, giving the company the benefit, it seemed to me to be a reasonable and liberal margin.

Q. In other words, the allowance of the additional 8 days over and above the weighted average lag in days as shown under Column 4, Page 4, is the liberality to which you refer?

A. Yes, I believe that is correct. As I said, if I had not wanted to have been—if liberal I could have been I wanted to be very meticulous about it, I could say that the bare statistics here of 37 days ought to do it. Now, I have not only given you eight days margin but I have not taken into consideration that those bills were for expenses which are often times not paid on the date which they accrue. You might pay them within ten days to get the discount. On the other hand, something might be actually accrued on the 10th of the month and be billed at the end of the month and I have tried to consider all those possibilities and I don't see any possible way in which the company is getting the worst end of this computation. It seems to me that there is always a possibility of delay in payment rather than working to the reverse.

Q. If you had used 37 days instead of 45 days, you wouldn't have considered that there was any element of liberality in the calculation, would you?

A. No, I wouldn't have been liberal if I had said 37 instead of 45.

Q. So the basis for your statement of your own liberality is due to the fact that you used 45 days instead of 37 days?

A. Essentially I think that is true. As I said just a minute ago, even those expenses incurred in that 37-day period might be, a great many of them, not paid until after

the end of the period, but I have gone on the assumption that expenses had to be paid cash on the line, right now, and still allowed eight days over and above that; whereas, in actual practice we know that most bills are delayed a few days before they are actually paid.

Q. Your opinion merely assumes the propriety of the formula which you employ on Page 4?

A. Well, I don't think there is any assumption as to the propriety of that formula. I think that formula is very proper.

Q. Well, my question was, wasn't your opinion as expressed in Note 2 on Page 1 based upon the assumption of the propriety of the formula set forth on Page 4?

A. Well, I'll answer that yes if it doesn't imply that there is any impropriety in the formula on Page 4.

Q. In other words, then, in testing your opinion as stated in Note 2, Page 1, we turn over to Page 4 and find what it is based on?

A. My opinion that 45 days allowance for operating expenses is liberal that opinion is based upon the fact that it exceeds by eight days the 37-day lag shown on Page 4.

Q. And that is the only basis of your statement with respect to your opinion in that regard; that is, eight days or more than 37?

A. Well, I might add this, if it is not getting off the subject, that in having made some investigation as to what regulatory bodies have done, I believe that 45 days is used very frequently and it has been considered that 45 days is a proper allowance under circumstances where the facts don't yield a contradictory result. In other words, I might put it this way: In reviewing what regulatory bodies have done, I believe I have seen that 45 days have been allowed more than any other one figure.

Q. Now, this opinion of yours is not arrived at as the result of any actual experience on your part in acting as treasurer for a company of this kind and taking care of the operating expenses and taxes and other expenses as they come along from time to time?

A. No, sir, it is arrived at by the experience of Colorado Interstate Gas Company. If you had a different set of facts you could come to an entirely different result and the date on which customers' bills are due, for example, is

a determining factor and no two companies would necessarily be the same. You have to confine your study basicly to the company's practice and, of course, essentially that is what I have done.

Q. Did you consult any financial officer of the Colorado Interstate Gas Company as to his working capital requirements?

A. No, sir, I didn't do that, but I did have the benefit of checking this result against Mr. Rhodes' estimate as compared with my $109,000 and he arrived at $120,000 so we were $11,000 apart, or less than ten per cent.

Mr. Campbell: Mr. Examiner, may I ask Mr. Smith a question?

The Trial Examiner: Yes.

By Mr. Campbell:

Q. You just stated, Mr. Smith, that this figure of yours was the experience of Colorado Interstate Gas Company and yet I see that you disallowed all minimum bank balances. Now, didn't Colorado Interstate Gas Company during this time have in existence minimum bank balances?

A. I think your assumption is incorrect that I disallowed the minimum bank balances.

Q. Then I misunderstood your statement. You say on Page 2: "No allowance is proposed for minimum bank balances for the following reasons," and then you give three reasons.

A. Yes, sir. I point out the conditions and experience of this company which gives them minimum bank balances and I don't propose a minimum bank balance in addition to the $109,064.98 that I have allowed, but I do show that the company's experience and the company's operation does yield for it and actually gives them a substantial minimum bank balance.

Q. Well, did you make a study of their actual bank balances over the year to see what that might average?

A. I did not because I considered it immaterial and irrelevant to this study.

Q. Yes. Well, now, do you believe that in the actual management of the company it is possible for them to so operate it that they can draw down their bank balances

to say $109,000 and hit your theoretical minimum or maximum, whichever you want to call it?

A. Well, this statement doesn't imply that. With the conditions stated there are minimum bank balances that are provided by reason of the facts clearly set forth in my foot-note here. The minimum bank balances are actually provided over and above this $109,000, if you want to put it that way.

Q. I don't think you have answered my question, Mr. Smith. I will ask you this. Perhaps you didn't understand the purport of my question: Can you yourself, receiving your income and paying your household expenses, can you yourself so conduct your affairs so that you can draw your bank account down to zero each month and put everything else to work for you either in the form of savings account, or invested funds?

A. Will you read the question again?

(The question referred to was read by the reporter, as set forth above.)

The Witness: Well, I have never tried to do that.

By Mr. Campbell:

Q. Do you think that a company actually faced with the necessities of business can do the same thing?

A. Yes, if they have a bank balance provided as I have shown in my Foot-note 4; that is, provided they can pay their expenses on this—working on the basis of this working capital allowance that I have recommended, they are going to have money in the bank all the time.

Q. And never have more than $109,000?

A. No, my statement doesn't mean that. It means that they will have quite a substantial fund. Let's look at Foot-note 4 and analyze that a little bit and show you just what I mean.

Q. You haven't answered my question. I don't care to have a lecture, I just want to have you answer my question.

A. Maybe I had better have the question I haven't answered.

The Trial Examiner: Well, you go ahead, Mr. Smith. What foot-note did you have reference to?

The Witness: Well, I think Foot-note 4.

The Trial Examiner: Page 2?

The Witness: Page 2, will develop the most basic reason why an additional allowance for minimum bank balances over and above the $109,000 is not necessary and that is due to the lag in the payment of taxes. You will find that the company in the year 1939 charged to expense on its books a total of $614,947.77 for taxes. Those taxes were charged against its revenue and, of course, at the time when the customers paid their bills they paid revenue to cover all of the charges against that revenue plus a profit to the company. Included in the charges against that revenue were the taxes. Now, the taxes that were accrued during 1939 amounting to $614,947.77 were almost all of them paid in 1940, or the next to the last line of that tabulation shows that $589,949.54 were paid in 1940. Now, approximately $25,000 were paid in 1939 and even those that were paid in 1939 were paid in the latter part of the year in 1939. Now, that experience shows that the company had received that revenue starting, we will say, in the latter part of February, to cover these taxes, and yet wasn't called upon to pay any substantial amount of those taxes until very late in 1939 and most of it in 1940, and, of course, a great part of that which was paid in 1940 represents the Federal income taxes which were paid in four quarterly instalments in 1940—March 15th, June 15th, September 15th and December 15th; so if I were to compute the lag in the payment of taxes and throw that in as a credit, why, it would reduce that $109,000 very materially and then of course, I would be called upon to put some sort of a judgment figure in for minimum bank balances but there again I have given the company the benefit of the doubt and feel that I have been very liberal in saying in effect that I won't throw in this credit for the deferment of tax payment, but, rather, will substitute that and let you get out of it whatever you may for minimum bank balances, and it should yield substantial minimum bank balances. It might even yield a figure as great as $109,000 in addition to the $109,000 which has been recommended for allowance. That's what I mean by saying that my method does yield a substantial allowance for minimum bank balances.

By Mr. Brock:

Q. Well, now, Mr. Smith, referring again to your Note 4 on Page 2 and taking the year 1939 as you have set up the taxes and compared them with the small amounts from March 1939 up until the end of the year, then showing a very large take in 1940, that doesn't present a very good picture on the basis of the actual performance of the company, does it? In other words, let me ask you another question:

Taking it year by year, the real situation is about as follows: A fourth of the income taxes are paid March 15th, a fourth of the income tax is paid June 15th and a fourth of it is paid September 15th, and a fourth is paid December 15th and half of the advalorem taxes paid by the end of February and the other half paid by the end of July. Now, that is what happens year in and year out and doesn't that present a very different picture from the figures which you have set up here in your Note 4? They are paying taxes right along. If you take the full year and then figure the actual dates when these several amounts of taxes are paid, isn't that so?

A. No, sir, that is not correct, because the first year they operated they didn't pay those taxes. They start paying them the second year and every year after that there is a lag of a whole year.

Q. But during the year—during each year these payments that I have mentioned have to be paid, do they not, for some period of time?

A. After the first year of operation you are always paying a year's taxes within a year but you are paying the preceding year's taxes essentially.

Q. But they are being paid every year except the first year, as you say?

A. That's right.

Q. Regardless of the fact that none are paid the first year, the cash has to be available each subsequent year on the several dates when the instalments come due, isn't that right? The cash has to be there?

A. That is correct and the cash that I have applied to that payment of taxes is related to revenues which are collected a year early.

Q. Does it make any difference as to the amount of cash which the company has to have available for the year 1939 to pay the several instalments of taxes which I have mentioned that it didn't pay any taxes in 1928?

A. I think it does.

Q. You think it does?

A. Yes, sir, because the company has always had the benefit of that year of lag and they still have it and they will always have it as long as there is a year's lag.

Q. You are considering this matter of benefit, not the matter of cash on the barrelhead when it is needed?

A. Well, you have got to consider my statement as a whole. It is predicated on a relationship of expenses to the collection of revenues and if you overlook that point and try to make some other point without coordinating it with that, why, then you are not considering all of the facts that I have presented here.

Q. Let me ask you another question: Does it make any difference when you are considering the amount of cash which the company must have on hand to meet these several tax payments for the year 1939, whether those taxes are being paid on the basis of something which has accrued that year rather than on the basis of something which has accrued in some prior year?

A. Yes, sir, from the viewpoint that I approach this it makes all the difference in the world. Now, if those taxes for 1939 had to be paid in 1939 why, I would have to have made a different computation.

(Vol. XXXVII, pp. 5110-5136.)

[Testimony of WILLIAM LUSK.]

Q. Mr. Lusk, this exhibit represents an estimate, doesn't it? The final figure of $190,000 is an estimate that doesn't appear on the company's books?

A. No, sir, it does not. That is a judgment figure taking the $200,674 for the three-year period and $195,000 for the five-year period, and it is rounded down to $190,000.

(Vol. LXV, p. 9269.)

---

23. **Annual Operating Expenses and Taxes, Exclusive of Cost of Gas, Income and Capital Stock Taxes, of Colorado Interstate for the Denver Line, 1928 to 1939, Inclusive, and as Estimated, 1940 to 1947, Inclusive.**

Respondent's witness Lusk in his Exhibit 76 (Vol. XVII, p. 2402) shows the adjusted operating and maintenance expenses and operating taxes of this company for each of the years 1928 to 1939 inclusive. He does not include as expense items those items originally charged as expense but which he has heretofore in his Exhibit 67, abstracted hereinabove, transferred to the capital account. Evidence as to cost of gas, depreciation, amortization, income taxes and capital stock taxes is abstracted hereinafter under titles referring to those subjects.

The respondent's witness Rhodes, who designed and participated for a time in the operation of the line, estimated the annual operating expenses and taxes for each of the years 1940 to 1947 inclusive in his Exhibit 135 (Vol. XXXI, p. 4307). He likewise excluded, at this point, cost of gas, depreciation, amortization, income and capital stock taxes; and the evidence as to the future requirements on account of these matters is hereafter abstracted under titles referring to those subjects.

The expenses on account of operation, maintenance and operating taxes, past and future, developed in these exhibits are best summarized on the attached statement taken from Exhibit 135 entitled "Operating Expenses and Taxes of Colorado Interstate Gas Company, 1928 to 1947, Inclusive:"

"Operating Expenses and Taxes of Colorado Interstate Gas Company, 1928 to 1947, Inclusive."

Rhodes took past expenses, as shown by Exhibit 76, grouped them and analyzed them for the purpose of extending them through 1947, and the extensions he made in Exhibit 135 reflected the trends in costs actually experienced by the company (Vol. XXXI, pp. 4307, 4308). The added costs involved in the added peak load compressor station facilities required after 1939 were estimated with due regard to the character of the operation. The compressor station maintenance expense and other expenses charged to compressor stations were separately studied. The operating expense and maintenance expense of compressor stations increases rapidly with any increase in volume of gas handled. The normal rate of such increase as experienced by the company in the past was determined and then projected into the future for the estimated future volumes. Since operations from 1932 to 1935 were sub normal on account of the slow development of the load, this fact was taken into account. In 1931, however, stations had been fully manned in anticipation of heavy growth, which did not materialize. Accordingly the trend in cost from 1931 to the average experienced in 1937 to 1939 inclusive was extended into the future as their normal operating cost (p. 4308). Additional facilities acquired subsequent to 1939 are peak load or booster facilities normally operated only during the winter and for which only skeleton crews were required. The estimated annual cost of these stations at a mere fraction of the average cost per horse-power of the existing stations, give due regard to such method of operation.

The normal trends in other expenses were determined from their average costs in 1935 to 1939 inclusive, as compared with their average costs in 1930 to 1934 inclusive. These trends show a relatively nominal increase in cost over the period which was extended into the future as the normal for those years. Prescribed future increases in social security taxes were separately allowed for. In 1939 the company instituted the plan of employees' welfare, involving the payment of premiums on retirement annuity policies. These were separately allowed for in the projected future expenses. Regulatory Commission expenses have been eliminated and the estimated cost of the pres-

ent rate case in the amount of $215,000 has been spread uniformly over the five years beginning with 1939.

The statement attached shows the annual expenses as actually incurred through 1939 and as projected through 1947. They are grouped in these several classes of expenses which were separately studied. The added expense of additional compressor station facilities are separately shown (p. 4309).

In further explanation of his method of estimating future expenses, Rhodes stated that the general method was this: Let us suppose that there is some item of expense that ran for the first five years of this decade at an average of $10,000 a year and in the last five years of this decade at $12,000 a year. This means that in the five years; that is, from the middle of the first five-year period to the middle of the second five-year period, there has been a $2,000 increase, or a $400 per annum increase. In trending into the future, he would take as normal $400 per year, taking the $12,000 as of the middle of the last five-year period. That is the general method followed except as to compressor station expense, which is a little more complicated (pp. 4310, 4311).

As to compressor stations, Column 1 on the statement shows the operating and maintenance costs as they existed in 1939. The cost of operating these stations are conveniently divided into two classes: first, the maintenance of the station proper, which varies with the amount of operation, and the remainder of the costs, which are not much affected by the operation of the station. As to the first, he made a study as to the relation between the annual expenditures for maintenance and the relation for the average volume of gas handled, with three systems running, and found that up to about an average load of 25% capacity there was practically no maintenance of the engines, but that beginning with loads larger than that, maintenance increased very rapidly. He projected that maintenance ahead to higher loads, such as would be had in the future, and assigned to each future year a normal maintenance corresponding to its load ratio, the ratio of its load to the capacity of the system with these stations

running. In handling other station expenses from 1932 to 1935, the stations were running only with skeleton crews, at least a part of them, so he made his trend there from 1931 to the past three years (p. 4312), both of which periods the stations were fully manned for regular operation, and he projected that trend at so many dollars per year into the future.

In addition to the base load equipment, there is the equipment already being installed in Canyon and Devine and the booster station to be constructed near Colorado Springs. The operation and maintenance cost of these stations have been priced at something less than half the average cost of running the stations in regular operation, because just one man at a time throughout the greater part of the year would be required (p. 4313).

In column 1 the increase in gas handled accounts for most of the difference between $115,000 in 1939 to roughly $149,000 in 1947. It is true that more maintenance is required as the compressors get older, but he did not allow for that condition. In general, each group of expenses was plotted in a rough manner to indicate the trend (p. 4314).

In 1941 and 1942 there will be the 1200-horse-power extension to the Devine station and the 600 horse-power unit in Canyon station, for which the operating and maintenance cost is estimated at $7,200 a year, or $4 a horse-power.

Beginning in 1943 there is a 600 horse-power addition in the Canyon station, and an 1800 horse-power booster station near Colorado Springs, which add $16,800, making a total of $25,800 for the additional 4200 horse-power, which is about $6 per horse-power per year.

The figures in column 1 running around $140,000 to $150,000 are for a total of 8,000 horse-power, approaching $20 per horse-power a year (p. 4315).

There is a difference in the cost where an additional unit is added, as distinguished from an entire new station.

In the existing stations there is already a full complement of men, and additional men will be required for only a part of the year to take care of the compressors that

are operated only during the winter; but when a new station is built there is nothing to start with, and a skeleton crew has to be provided, for which he made an allowance of $9,000 a year. It takes five men on the payroll to maintain one man continuously on duty, and their wages with incidental expenses would aggregate just about $9,000.

In the transmission lines, the trend was found by taking the years 1935 to 1939 and determining the average cost, which was approximately $93,000 a year, as the late measure of costs, and the average from 1930 to 1934 as the early measure of cost, which was about $81,000 a year. The normal cost for future years, taken as an increase above the 1937 cost at an average trend, showed that the average increase per year was approximately $2480. He started from the five year average as of 1937, and increased at that rate for the future years after 1937 (p. 4316).

For the year 1939 the amount shown is $109,138, and starting with 1940 the estimate was less, until he reached the year 1944. The significance of that is, that there have been in the last two years some increases in wages, which would account for part of it, but the expenses vary from year to year, depending upon storms and the like.

As to meters and metering, he combined the cost of operating meters in the field and the meter department in the office, and the trend was determined by comparing 1935 to 1939 inclusive, with 1930 to 1934 inclusive, which trend was found to be $1600 a year. In this case there had been a rather steady expenditure from 1936 to 1939 inclusive, so, instead of trending from 1937 he trended at that rate from 1938 and 1939, taking in round figures, $50,000 a year; that is, he started with $50,000 a year as normal for 1939, and added $1600 to each succeeding year, as representing the normal trend (p. 4317).

The art of measuring gas has been gradually changing, involving the application of more factors, and it is the duty of the department to analyze and study changes in growth, all of which becomes more and more complicated as the property becomes larger and there is a tendency to increase wages.

As to the telephone system, 1937 showed an abnormally large expense, and if he had followed the method of trending described for the transmission system, it would have led to an increased cost far above normal, so they eliminated 1937 and determined the trend from 1935 to 1939 on the one hand, and 1930 to 1934 on the other hand, finding an increase in cost of $210 per year (p. 4318).

The general expenses were trended as a whole. There was first taken out the management fees in the early days and the annuity payments which began in 1939. There were two distinctly abnormal years, 1932 very high, and 1935 very low, which he could not explain.

After these eliminations, the trends between the first five years and the second five years of the decade was found to be $1470 a year (p. 4319).

For the future, the $21,870 per year, employees' welfare payments made in 1939, were deemed to continue at the same amount year by year, although they may be increased, and they were added separately to the trended amounts.

The management fees remain in column 6, but were taken out for trending purposes, and also the expenses in 1939 for regulatory Commission purposes. These expenses had to do with the pending case (p. 4320).

As to operating expenses, there was first taken out the social security taxes, leaving ad valorem and miscellaneous taxes. These taxes seemed to group themselves into a six year period for the first part of the decade, and a four year period for the latter part. They were so averaged for the purpose of determining the trend. The trend upward was trended to average $3646 per year.

The social security taxes were restored starting with 1939 and keeping at that amount, but adjusting it upwards at the higher rates provided.

As to the rate case expense, it was spread over the five years from 1939. The amount was determined in discussing the matter among ourselves, and knowing that up to the latter part of (p. 4321) this year something over $100,000 had been spent. He merely estimated that $215,-

000 might cover the cost of the proceeding. In estimating this amount he had in mind three or four other rate cases in which he had participated.

> "Q. And after studying the past operating expenses and the future anticipated business of the company, is it your judgment that that is a fair estimate of the change in operating expenses that might be anticipated on the Colorado Interstate line as a whole during those years?
>
> "A. It is." (Vol. XXXI, p. 4322.)

In his Exhibit 135-A, Rhodes presented a graph showing the trending line of the expenses through the year 1940 (Vol. XXXII, p. 4502).

Years Ended Dec. 31

For the Commission, its Accountant, Early, in his testimony, and in his Exhibit 140 (Schedule B-21, Sheet 3, page 105 of said exhibit) reduced the operating expenses for the year 1939, as shown by the books of the company, in the amount of $507,913.23, down to $425,018.63. He also suspended for further consideration of the Commission $125,587.98. The Commission in its findings and opinion, however, allowed these items so adjusted and suspended.

COLORADO INTERSTATE GAS CO.
EXPENSES SUSPENDED FOR FURTHER CONSIDERATION BY THE COMMISSION
FOR THE YEARS 1937, 1938 AND 1939

Line No.	Income Statement Suspension No. (1)	Particulars (2)	Year Ended December 31, 1939 (3)	1938 (4)	1937 (5)
	C (Cont'd)	In view of the statements made by Mr. Lorch and the relative smallness of the amounts involved, it is recommended that the charges identified by the suspension be allowed as necessary and legitimate expenses and therefore included in the cost of conducting gas operations. Suspension has been made by the Examiner primarily in order that the Commission might have before it in this suspension and in Suspension B a summarization of service charges made by associated companies to the Respondent and included in its operating expenses.			
			$ 391,526.13	$ 309,837.61	$ 222,[illegible].21
9	D	Federal income tax Income taxes for the years 1937, 1938 and 1939, as adjusted, have been suspended for further study and consideration by the Commission and its staff for the reason that the income received by the Respondent, and which constituted the basis for the assessment of its income taxes, may, as a result of this proceeding, be found to have been in excess of a fair return. The Examiner recommends that expenses chargeable to the ratepayers include, with respect to income taxes, only such an amount as would represent the necessary taxes required to be paid based upon the income which the Commission determines it is proper for the Company to earn.			
			$ 27,[illegible]14.12	$ 18,262.11	$ 8,407.57
10	E	Colorado income tax The comments above under Suspension D also pertain to Suspension E.			
11	F	Items charged to expense claimed as cost of gas plant in report of Ford, Bacon & Davis, Inc., dated April 15, 1940 Certain expenses for the years 1937, 1938 and 1939, now claimed by the Respondent as gas plant capital expenditures, have been suspended in order that the expenses so claimed may be identified for the attention of the Commission and its staff. The report of Ford, Bacon & Davis, Inc. covering the claim for restatement of plant has been filed with the Commission by the Respondent. A reconciliation of the amounts shown in the report of Ford, Bacon & Davis, Inc. for the years 1937, 1938 and 1939 with the amounts of this suspension is as follows:			
			$ [illegible],383.75	$ 50,[illegible]58.76	$ 55,[illegible]91.00

	1939	1938	1937
Per Ford, Bacon & Davis, Inc. report	$14,[illegible]22.63	$52,051.24	$56,777.13
Portion of work order 270 (making profile map) claimed as gas plant, expended in the year 1937, and closed to expense in the year 1938 (The entire amount charged to this work order in the year 1937 is transferred to 1937 operating expenses in Examiner's entry R-151)		(559.21)	559.21
Less, interest during construction claimed as gas plant, not included in this suspension	(838.88)	(1,333.27)	(1,645.34)
Per this suspension	$14,383.75	$50,158.76	$55,691.00

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S RECLASSIFYING AND ADJUSTING ENTRIES
RELATING TO THE INCOME ACCOUNT

32

Particulars	Year to Which Applicable	Debit	Credit
No. B-119			
Operating expenses - general and administrative expenses - stores expenses	1939	$ 121.17	
Prepayments	12/31/39		$ 121.17

To reclassify 1939 inventory adjustments which were carried by Respondent in the balance sheet under prepayments caption as of December 31, 1939.

No. B-120			
Operating expenses - maintenance of transmission line equipment	1938	$ 7,993.82	
do.	1937	8,835.52	
do.	1936	8,630.30	
Operating revenues	1938		$ 7,993.82
do.	1937		8,835.52
do.	1936		8,630.30

To reclassify as operating expenses the allowances to Arkansas Valley Natural Gas Company which were recorded on the Respondent's books as a reduction of operating revenue. See explanation of entry R-106 for further details regarding the nature of these allowances. See also entry 141 for further adjustment of items in question.

Docket G-124

Schedule B-16
Sheet 22 of 50

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S RECLASSIFYING AND ADJUSTING ENTRIES
RELATING TO THE INCOME ACCOUNT. 42

Particulars	Year to Which Applicable	Debit	Credit
No. R-132			
Accrued utility revenues	12/31/39	$ 78,685.11	
Operating revenues	1939	5,592.12	
Operating revenues	1939		$ 84,277.23

To set up the estimated accrued utility revenues unbilled at December 31, 1939, based on actual meter readings at that date. Prior to 1939 the Respondent's practice was to set up this accrual at the end of each year and to reverse the entry in the following January. However, this procedure was discontinued as of Dec. 31, 1939. In order that the schedule of operating revenues for the year 1939 may be presented on a basis comparable with the preceding years, the estimated accrued utility revenues are taken into account by this entry. The distribution of the volume of gas as between residential and commercial gas and industrial gas is based on the ratio of each type of service to the total in the previous monthly billing period. The allowances for space-heating gas are based on allowance in the previous monthly billing period. Following is the detail of the accrued revenues by customers and by types of service:

Description	Revenue	M.C.F. Contract Metering Base	M.C.F. Uniform Base 14.65 lbs. per sq.in.
Gross revenues accrued			
Citizens Utilities Company (Dec. 16 - Dec. 31)			
La Junta			
Residential and commercial gas			
At 40 cents per MCF	$ 555.20	1,388	1,250
At 36 cents per MCF	1,374.48	3,818	3,440
Industrial gas	362.84	1,506	1,357
Gas lost	221.94	932	840
Total La Junta	$2,514.46	7,644	6,887

do.	1936		8,630.30
do.	1935		4,692.83

To relieve operating expenses of the allowances by the Respondent to Arkansas Valley Natural Gas Company representing 15% of the Respondent's revenue from the U.S. Veterans Administration at Fort Lyon, Colorado. According to the terms of an amendatory agreement between the Respondent and Arkansas Valley Natural Gas Company dated December 5, 1935, retroactive to May 1, 1935, these allowances were in consideration for the maintenance by Arkansas Valley Natural Gas Company of the Respondent's pipe line which serves the Veterans Administration. This pipe line is approximately 2.9 miles in length.

On November 17, 1939 and again on January 18, 1940 the Examiner requested the Respondent in writing to furnish: (1) The book cost of the above pipe line, (2) the basis for arriving at 15% of gross revenue from the Veterans Administration as payment for maintenance of said pipe line, and (3) a statement of the actual amounts expended by Arkansas Valley Natural Gas Company for maintenance of the pipe line. To date no response has been received by the Examiner to the above-mentioned letters. The amounts are, therefore, entirely unsupported.

Two instances were noted in which the Respondent bore actual expenses of certain maintenance on the line in question which, according to the terms

No. 141 (cont'd)

of the contract dated December 5, 1935, apparently should have been borne by Arkansas Valley Natural Gas Company.

On work order No. 222, zinc rod cathodic protection was installed, according to company drawings, on approximately 54,632 feet of pipe line in 1936, including 2,164 feet of pipe line in the section agreed to be maintained by Arkansas Valley Natural Gas Company. The total charges to this work order were $14,208.99, and the entire amount was charged on voucher K-35, dated October 31, 1936, to account 385-D, Maintenance of Transmission Line Equipment. An allocation of the total charges to this work order on a per-foot basis shows that approximately $550.00 would be properly chargeable to the section of line agreed to be maintained by Arkansas Valley Natural Gas Company, but no part of the cost of the work was charged to that company.

On work order No. 282, zinc rod cathodic protection was installed, according to company drawings, on 8,800 feet of six inch line in 1937, all within the section to be maintained by Arkansas Valley Natural Gas Company. The total charges to this work order amounted to $2,228.58, all of which was charged on voucher M-41, dated December 31, 1937, to account 385-D, Maintenance of Transmission Line Equipment. The title of this work order indicated that the work was chargeable to Arkansas Valley Natural Gas Company, and the completion notice signed by Mr. J. P. McClintock, General Superintendent, dated November 10, 1937, had the following statement under "Remarks":

> "Please charge to Arkansas Valley Natural Gas Company, maintenance expense on 6" line from Arkansas River Crossing to Fort Lyon."

Work orders are ordinarily charged by the Respondent as recommended by the General Superintendent. However, in this instance, Arkansas Valley Natural Gas Company objected to the charge, as evidenced by a telegram dated January 28, 1938 from the Respondent's Colorado Springs office to the New York office, in which the opinion of Mr. F. H. Lerch, Jr., then Vice President of Colorado Interstate Gas Company as to the disposition of the charge was requested. In Mr. Lerch's reply of the same date, he suggested that the charge be made to Colorado Interstate Gas Company as similar items in the past.

Effective April 1, 1940, Arkansas Valley Natural Gas Company sold most of its properties to Citizens Utilities Company, including its properties in the vicinity of the Veterans Administration. Beginning April 1, 1940, no further allowances of 15% of the Respondent's revenue from the Veterans Administration were made by the Respondent, either to Arkansas Valley Natural Gas Company or to Citizens Utilities Company. The expenses in question are therefore nonrecurring as well as unsupported.

Exhibit No. 140

Docket G-124

Schedule B-16
Sheet 49 of 50

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S RECLASSIFYING AND ADJUSTING ENTRIES
RELATING TO THE INCOME ACCOUNT

69

Particulars	Year to Which Applicable	Debit	Credit
No. R-153			
Other deferred debits	12/31/39	$58,290.20	
Operating expenses (detailed below)	1939		$58,290.20

To reclassify, pending decision of the Commission as to proper disposition thereof, expenses incurred by Respondent to December 31, 1939 as a result of the rate investigation by the Commission:

Account Credited Herein	Amount
Miscellaneous general expenses (Colorado Springs office)	$51,797.21
Special legal services	6,382.16
Rent	110.83
Total	$58,290.20

Analytical details of the above amount are presented on Subschedule 1 of Schedule A-13 which supports the deferred amount appearing in the balance sheet as of December 31, 1939.

Reclassification as a deferred debit has the effect of placing the charges in suspense pending the Commission's decision regarding ultimate disposition thereof.

Notes:

(1) Amount per books and as adjusted includes $10,040.27 for expense of soil resistivity survey on main line from Clayton to Denver. The Bureau of Engineering recommends that this item be considered extraordinary expense.

(2) Employees' welfare expenses for the year 1939 include $21,869.47 representing payments by the company as a result of a retirement plan agreement effective January 1, 1939 with The Prudential Insurance Company of America. The plan consists, in effect, of two parts: (1) It provides that the employee make certain contributions, within maximum and minimum limits, based upon current salary, to purchase annuities and that the company match such contributions, and (2) it further provides that the company pay for the entire annual cost for 1939 and subsequent years of purchasing additional annuities based upon services rendered prior to January 1, 1939, such payments being governed by the length of the employee's service with the company prior to January 1, 1939 and the salary rate in effect as of January 1, 1939. The amount which the company paid for the year 1939 as a result of the latter provision was $10,552.13.

Exhibit No. 110

105

This witness also prepared and submitted in evidence Exhibit 144, described by him as follows:

A. "This report consists of a balance sheet of Colorado Interstate Gas Company as at December 31, 1939, and eight accompanying schedules, Statement A-1 shows the balance sheet per the company's books, adjustments and reclassifications of items contained in it, which were made by the Examiner, and, finally, the balance sheet as adjusted. The eight schedules comprise one that summarizes the Examiner's adjustment and reclassification entries and seven that support and explain balance sheet items, namely, Investment in and Advances to Associated Companies, Unamortized Debt Discount and Expense, Other Deferred Debits, including Rate Case Expenses, Capital Stock, Long-Term Debt, and Surplus.

"Schedule A-10, which is the first schedule, gives the Examiner's Adjustments and Reclassifications in summary form; it does not show the reclassification and adjusting entries themselves. The entries are to be found in other accounting studies which were prepared by members of the Federal Power Commission staff and which will also be offered in evidence in this case.

"Entries Nos. 100 to 154, inclusive, are shown in Schedule B-16 of the study entitled 'Income Accounts and Supplemental Data, including Examiner's Reclassifications and Adjustments;' Entries Nos. 200 to 227, inclusive, are given in the study entitled 'Gas Plant Accounts and Examiner's Adjustments;' and Entries Nos. 400 to 407, inclusive, are part of the study on 'Annual and Accrued Depreciation of Gas Plant, and Examiner's Adjustments.'

"The adjustment and reclassification debits and credits shown against balance sheet accounts on Statement A-1 are the footings of the columns in Schedule A-10, each of which columns represents a balance sheet account and contains all the entries affecting the account that it represents.

"Schedule A-11 presents the particulars of the company's investment in and advances to Canadian River Gas Company.

"Schedule A-12 shows the expenses relating to the issu-

ance of the company's bonds, the annual amortization on those bonds from 1928 to 1939, inclusive, and their unamortized balance as at December 31, 1939. It also shows payments made in connection with the reduction in 1938 of bond interest, from 6 per cent to 3½ per cent per annum, together with the amortization thereof as adjusted for the years 1938 and 1939, and the unamortized balance as adjusted as of December 31, 1939.

"Schedule A-13, which is made up entirely of Examiner's reclassification and adjustment items, is a summary of Other Deferred Debits. It is supported by Schedule A-13-1 which is an analysis of rate case expenses incurred by the respondent during 1939.

"These rate case expenses have been reclassified as deferred debits (Entry R-153) pending the decision of the Commission as to their disposition. The total amount of Schedule A-13-1, $58,290.20, represents Suspension G of Expenses Suspended for Further Consideration of the Commission, in Statement B-4 of the study on income accounts. Approximately $52,000 of the total is the cost of a valuation and physical inspection made of the company's properties by Ford, Bacon & Davis, Inc. This firm billed for its work at cost of services, plus 10 per cent, plus overheads of approximately 75 per cent, and plus expenses at cost.

"Schedule A-14 shows the number of shares of capital stock outstanding, both common and preferred, their book value, the consideration for which issued, the names of their holders at December 31, 1939, and the terms upon which the preferred stock is callable. At the balance sheet date there were three shareholders of the 1,250,000 shares of common stock outstanding; Standard Oil Company (New Jersey) with 531,250 shares issued for $1,000,000 in cash; Southwestern Development Company with 531,250 shares valued at $1,000,000, issued as part consideration for Canadian River Gas Company (one of its subsidiaries) entering into a contract to sell natural gas to this company; and Public Service Company of Colorado with 187,500 shares valued at $352,941.17 which were initially issued to Cities Service Company in consideration for Public Serv-

ice Company of Colorado and Pueblo Gas & Fuel Company (two subsidiaries of Cities Service Company) entering into contracts to purchase natural gas from this company. At December 31, 1939, there were two shareholders of the 20,000 shares of preferred stock outstanding: Standard Oil Company (New Jersey) with 10,000 shares issued for $1,000,000 in cash; and Consolidated Oil Corporation with 10,000 shares which were originally issued to Southwestern Development Company as part consideration for Canadian River Gas Company entering into a contract to sell natural gas to this company.

"Schedule A-15 shows the total amount of company's twenty-year bonds, dated June 1, 1928, that have been issued, the amount of them that have been redeemed, and the balance of them outstanding on December 31, 1939. They comprise the company's entire long-term debt. These bonds were issued in 1928 and 1929 at 100 in the principal amount of $19,200,000. From June 1, 1930, to December 31, 1939, $10,335,000 of them, in principal amount, had been redeemed leaving outstanding as of December 31, 1939, bonds in the principal amount of $8,865,000. Redemptions were made in accordance with the provisions of the Bond Indenture, at prices ranging from 102 to 104, except that since November 1, 1938, redemptions have been made at 100. From their date of issuance until November 1, 1938, the bonds bore interest at the rate of 6 per cent per annum; since November, 1938, they have paid interest at the rate of 3½ per cent per annum. The change in the redemption price and the interest rate of the bonds was made in connection with the purchase of the bonds by Guaranty Trust Company of New York and The Mutual Life Insurance Company of New York from their former owners.

"Schedule A-16 shows twenty-four Examiner's adjustments and reclassifications of the Surplus Account that increase the balance of that account as of December 31, 1939, from $2,479,133.92 to $6,113,633.83. These entries are the same as those shown in Column 16 of Schedule A-10. They are reproduced in Schedule A-16 so that they may be more conveniently referred to and to provide a reconciliation of the amount of the balance in the Surplus Account per books and as adjusted by the Examiner."

Q. Mr. Early, in the preparation of this Exhibit 144, you, of course, had available to you the books, accounts and records of the Colorado Interstate Gas Company?

A. Yes, I did.

Q. And from those you prepared this exhibit?

A. That is correct.

Q. And I also note that on the title page that subsequent to your preparation of the formal exhibit and before it was reproduced it received the approval of Kenneth L. Smith in charge of field assignment; Harold Tomlin, Examiner in charge of the regional office, and W. E. Baker, chief accountant, all of whom are on the accounting staff of the Federal Power Commission.

A. That is correct.

(Vol. XXXVII, pp. 5080-5085.)

Line No.	Particulars (1)	Cost (2)
1	Canadian River Gas Company First Mortgage and Collateral Trust Twenty-year Six Per Cent Sinking Fund Gold Bonds, due June 1, 1948	$5,057,000.00
	Colorado Interstate Gas Company has owned all of Canadian River Gas Company's bonds outstanding from the inception of that company in 1928 to December 31, 1939. Such bonds have been pledged by Colorado Interstate Gas Company as collateral for its own bonds.	
2	Canadian River Gas Company Promissory Notes	1,348,254.14
	These notes have been issued from time to time by Canadian River Gas Company to finance its current construction after the exhaustion of the funds obtained from the sale of its bonds. The notes are redeemable in equal monthly installments over a period of 120 months from date of issuance or by May 31, 1948, whichever is the shorter period. The notes bear interest at the rate of 6% per annum, payable semiannually on January 1 and July 1.	
3	Total investment in and advances to associated company	$6,405,254.14

* Cost is equivalent to the principal amount of debt owned.

Notes:

(1) The preferred stock is callable on any quarterly dividend payment date after five years from date of issuance (June 5, 1928) at $105.00 per share plus accrued dividends thereon. Dividends on preferred stock at the rate of 6% per annum are cumulative and payable before any dividends on the common stock may be paid or declared.

(2) The Examiner has not adjusted capital stock accounts for credits thereto resulting from capitalization of contracts for purchase and sale of gas. The amounts charged to plant by Respondent for capitalization of such contracts were transferred to Gas Plant Adjustments account by adjusting entry number 224. The Gas Plant Adjustments account is subject to such disposition as the Commission may approve or direct.

Exhibit No. 144

Docket G-124

Schedule A-15
Sheet 1 of 1

COLORADO INTERSTATE GAS COMPANY
LONG-TERM DEBT
DECEMBER 31, 1939

10

First Mortgage and Collateral Trust Twenty-year 3½% Sinking Fund Gold Bonds, dated June 1, 1928, due June 1, 1948:	
Issued June 14, 1928, at 100	$ 7,021,000.00
Issued June 27, 1928, at 100	8,470,000.00
Issued December 3, 1928, at 100	1,401,000.00
Issued December 30, 1929, at 100	2,308,000.00
Total issued	$19,200,000.00
Principal amount redeemed from June 1, 1930 to December 31, 1939	10,335,000.00
Balance outstanding, December 31, 1939	$ 8,865,000.00

Notes:

(1) The bonds as originally issued bore interest at the rate of 6% per annum. On October 28, 1938 the Board of Directors approved a Third Supplemental Indenture, dated November 1, 1938, to the existing mortgage, under the terms of which the interest rate was reduced from 6% to 3½% per annum, in connection with the purchase of the bonds by the Guaranty Trust Company of New York and The Mutual Life Insurance Company of New York from the previous owners of the bonds.

(2) According to the terms of the Third Supplemental Indenture, the bonds outstanding on December 31, 1939 are to be redeemed through quarterly sinking fund contributions, on March 1, June 1, September 1, and December 1 of each year, in the following total annual amounts:

Year 1940	$1,000,000.00
" 1941	1,000,000.00
" 1942	1,000,000.00
" 1943	1,000,000.00
" 1944	1,080,000.00
" 1945	1,080,000.00
" 1946	1,080,000.00
" 1947	1,080,000.00
" 1948	545,000.00
Total	$8,865,000.00

EXHIBIT NO. 293.
Dockets G-118, G-121 and G-124.

Written Statement of James V. O'Connor.

Exhibit No. 293 presents estimated volume of gas sales, estimated volume of gas purchased, and estimated operating expenses (excluding purchased gas expense, regulatory commission expense, depreciation expense, Colorado income tax, Federal capital stock tax, and Federal taxes on income) of Colorado Interstate Gas Company for the year 1941. The exhibit is composed of four schedules as follows:

Schedule No. 1: Estimated Volume of Gas Sales, 1941.

Schedule No. 2: Estimated Volume of Gas Purchased, 1941.

Schedule No. 3: Estimated Operating Expenses, 1941 (Excluding purchased gas expense, regulatory commission expense, and depreciation expense).

Schedule No. 4: Estimated Taxes, 1941 (Excluding Colorado income tax, Federal capital stock tax, and Federal taxes on income).

Operating expenses shown in Schedule No. 3 are detailed in the following schedules:

Schedule No. 3-A: Transmission Expenses, 1941.

Schedule No. 3-B: Distribution Expenses, 1941.

Schedule No. 3-C: General and Administrative Expenses, 1941.

The volume of gas sales to each customer, as shown in Schedule No. 1, is based on a study of the records of Colorado Interstate Gas Company, data received from its customers, and an analysis of 1941 market conditions. No increase has been estimated for possible sales to new industrial customers, nor do the estimates reflect possible increases in sales to present customers which would result from reductions in rates.

Schedule No. 2 shows estimated volumes of gas to be purchased in 1941 from Canadian River Gas Company to supply Colorado Interstate Gas Company's requirements

for its Denver Line and the Chicago Line of Natural Gas Pipeline Company of America.

Transmission, distribution, sales promotion, and general and administrative expenses, as shown in Schedules No. 3, 3-A, 3-B and 3-C, are based on an analysis of the experience of the company in recent years, and consideration of factors which affect these expenses. No estimates have been made of purchased gas expense, regulatory commission expense, and depreciation expense. Sales promotion expense in past years has related to new industrial business; and since no new industrial customers are included in the 1941 sales estimates in Schedule No. 1, no amount has been included for sales promotion expense in Schedule No. 3. The account description shown in Schedules No. 3, 3-A, 3-B and 3-C correspond to those in Exhibit No. 140.

Taxes, shown in Schedule No. 4, have been estimated on the basis of present tax rates. No estimates have been made of Colorado income tax, and the following Federal taxes; capital stock, declared value-excess profits, income, excess profits, and defense taxes.

Schedule No. 1.

Colorado Interstate Gas Company.

Estimated Volume of Gas Sales for the Year 1941

Line	Description	Gas Sales MCF*
	(1)	(2)
	Direct Industrial Sales	
1	American Crystal Sugar Company	370,000
2	Atchison, Topeka & Santa Fe Railway Co.	410,000
3	Colorado Portland Cement Company	2,060,000
	Colorado Fuel & Iron Corporation	
4	Boiler Fuel Gas	4,250,000
5	Metallurgical Gas	4,250,000
6	Total	8,500,000
7	Total Direct Industrial Sales	11,340,000

*All MCF figures are on a uniform pressure base of 14.65 pounds per square inch absolute.

Line	Description	Gas Sales MCF*
	(1)	(2)
	Sales to Public Authorities	
8	Department of the Interior	700
9	Veterans Administration	200,000
10	Total Sales to Public Authorities	200,700
11	Total Direct Sales to Ultimate Consumers	11,540,700
	Sales to Gas Utilities	
12	Arkansas Valley Natural Gas Company	16,000
	Citizens Utilities Company	
13	Domestic Gas—First Block	44,000
14	Domestic Gas—Second Block	123,000
15	Total Domestic Gas	167,000
16	Industrial Gas	34,000
17	Gas Lost	22,000
18	Total	223,000
	City of Colorado Springs	
19	Domestic Gas	404,000
20	Space-heating Allowance	255,000
21	Municipal Power Plant Gas	470,000
22	Industrial Gas	177,000
23	Total	1,051,000
	Colorado-Wyoming Gas Company	
24	Domestic Gas	1,398,000
25	Industrial Gas	1,647,700
26	Total	3,045,700
	Public Service Company of Colorado	
27	Domestic Gas	5,120,000
28	Space-heating Allowance	3,330,000
29	Industrial Gas	2,600,000
30	Total	7,720,000

*All MCF figures are on a uniform pressure base of 14.65 pounds per square inch absolute.

Line	Description	Gas Sales MCF*

12	Special legal services	3,000
13	Insurance	7,900
14	Injuries and damages	700
15	Absent time due to illness	2,400
16	Employees' welfare	22,800
17	Rent	1,600
18	Stores expenses	2,500
19	Management and supervision fees	19,000
20	Miscellaneous general expenses	1,000
21	Total operation	$107,800
	Maintenance	
22	Telephone system	$ 900
23	Office and other general equipment	300
24	Total maintenance	$ 1,200
25	Total general and administrative expenses (1)	$109,000

(1) No estimate included for purchased gas expense and regulatory commission expense.

Q. Mr. O'Connor, the description you gave of the inquiry by customers, both of the Colorado Interstate Gas Company and some of the utility distributing companies, which you said were contained on three pages, those apply to the estimates made in Exhibit 293 as well as in Exhibit 292?

A. Yes, sir.

Q. Have you made any comparison of your estimates with those made by Mr. Beardsley, which are contained in his Exhibits 56 and 59?

A. I think I did.

Q. You show on a whole as we figure it, about 6.5 per cent increase over the figures in the company's exhibits, 56 and 59.

A. 6.5 per cent—I know I have about 1,700,000 Mcf., approximately, on the Denver line and I know I am higher on the Chicago line because I believe Mr. Beardsley used the estimates supplied by the Natural Gas Pipeline Company of America, which seemed to be too low.

Q. Some instances you have increases in your estimates over his, and in others there are some decreases. Did you observe that fact?

A. That is correct.

Q. You have some considerable increase for the Colorado Portland Cement Company. Does that increase involve any recent addition in their capacity or additional business development within the past few months?

A. No, that is based upon information they supplied to us some time ago, but I think we have—well, it may have been as late as January 18, 1941.

Q. You have had more recent information for the purpose of making your estimates than was available when Mr. Beardsley made his?

A. As I recollect Mr. Beardsley said that he wasn't able to contact anybody there so he had to be guided by the recent experience of the company. We found from talking to them that they had additional orders for cement on the Caddoa Dam on the Arkansas River which would involve a substantial increase in production for 1941, 1942, and 1943, so we took that into account.

Then we found that their shipments were running much higher when compared to what they were running a year

ago, so we added 10 per cent more above their normal—we took their four-year average production and added about ten per cent due to increased business activity and then we added the Caddoa Dam order.

They told us they were probably going to get something on the Big Thompson project and this Remington Arms munition factory but they didn't know just how much.

Q. In determining your operating expenses for 1941, did you use 1934 and 1939 as a guide?

A. Well, I used all the data I could get from the analysis prepared by the accounting staff which went back over a period of years, but it was in some detail from 1934 on. It was completely adjusted to their basis for 1937, 1938, 1939, and partially adjusted for major items in 1934, 1935, and 1936.

Then in addition we took off account totals from some of the expenses of the company as a further guide.

Q. You carried forward adjustments that had been made by Mr. Early in Exhibit No. 140?

A. There is one that I can think of specifically and that is an item I have for miscellaneous under distribution system expense. That represents spreading over five years a payment which Colorado Interstate made to Colorado-Wyoming Gas Company in the middle of 1938. They charged it off in the year in which they paid it and he spread it over five years, so to be consistent I had to include the same amount in my estimates.

Q. With respect to this gas purchase expense which you referred to in Schedule No. 3, you have not brought that into the operating expenses of the Colorado Interstate Gas Company as you did in Canadian River?

A. Gas purchased expense?

Q. Yes. You have a note at the bottom of Schedule 3 where you say: "No estimate included for gas purchased expense."

A. I haven't made any estimates of the total gas purchased expense, but I necessarily had to make estimates regarding the amount used in operations.

Q. The statement at the bottom of Schedule 3 does not include that for gas used in operations?

A. That is right.

Q. You have that over in your operating expenses elsewhere?

A. Yes. For instance, on Schedule 3-A under "Compressing System, Supplies and Expenses," are listed at $30,100. There is around $18,000 in there for gas used at the compressing stations.

Redirect Examination.

By Mr. Lange:

Q. Mr. O'Connor in the preparation of Exhibit 293, as well as in the preparation of Exhibit 292, I take it you had available the information you have just described as to the company's past history, its records, as well as the information you were able to get from purchasers as to past requirements of gas?

A. That is right. I had all of these records that the accounting staff had made, and we made some analyses of our own, in addition, for some of these expenses where they jumped around, and we wanted to know why.

Q. In other words, then, based upon your analysis of operating expenses of the companies as well as the information that you had as to past sales records of the companies, you then projected these estimates for the year 1941?

A. That is correct.

(Vol. C, pp. 15560-15564.)

---

24. Annual Operating Expenses and Taxes, Exclusive of Cost of Gas, Income and Capital Stock Taxes, of Colorado Interstate for an Assumed Denver Line for Resale Gas Only, as Estimated, 1928 to 1947, Inclusive.

Exhibit 136 (witness Rhodes, Vol. XXXII, p. 4431) sets forth the annual expenses estimated to be required from 1928 to 1947 inclusive in the operation of Colorado Interstate's portion of the assumed Denver Line for resale gas alone, which line he describes in Exhibit 98. The annual expenses shown are exclusive of income and capital stock taxes and cost of gas at Clayton. Such expenses were determined from the expenses actually incurred by the company from 1928 to 1939 inclusive, set forth in Exhibit 76. Adjustments were made in these expenses to reflect the

difference in annual expenses required by the different facilities involved in the resale line. All adjustments, except for new facilities, were based on the costs actually incurred. The costs for 1928 to 1939 inclusive, were extended through 1947, reflecting the trends in costs actually experienced by the company. The added costs involved in the added peak load compressor station facilities acquired after 1939 were estimated with regard to the character of operation. Savings in the cost in the year 1939 on account of the reduced facilities for the resale line alone are summarized as follows: (p. 4432.)

(a) Reduction in cost of maintaining the compressor stations due to lesser operation of the equipment made possible through the poorer load factor of resale gas as compared with all gas sold	$ 9,225
(b) Reduction in cost of operating and maintaining the transmission lines through the elimination of laterals used solely for direct sale gas	5,701
(c) Reduction in cost of operating and maintaining the telephone system due to the elimination of the Pueblo branch line	440
(d) Reduction in the cost of maintaining and operating measuring stations and the Meter Department through the elimination of the meters used solely for direct sale gas	19,694
(e) Reduction in Land Department, General Administrative, Other General and New York Office Expenses pro rata with the above reductions	10,927
(f) Reduction in operating taxes pro rata with reduction in equivalent original cost of a resale pipe line shown in Exhibit No. 134 as compared with the present line shown in Exhibit No. 67	10,642
(g) Elimination of Regulatory Commission expense for adjustment, spreading the estimated total rate case expense over five years	63,096

(h) Total gross deductions from 1939 expenses as incurred $119,725

(i) Restoration of one fifth of estimated total rate case expense 43,000

(j) Net deductions from 1939 expenses shown by Exhibit No. 76 ..... $ 76,725
(p. 4433)

These allowances reflect the upper limit of possible savings. Adjustments were made in earlier years reflecting the actual expenses incurred. The expenses of the system as it existed in 1939 were extended through 1947 to reflect the inherently increasing normal costs experienced by the company in past years, and to reflect in future years the annuity and retirement expenditures instituted in 1939 and increases in social security taxes.

In addition to the expenses estimated to be required in the operation of the facilities as they existed in 1939, provision was made for the operation and maintenance of all the additional peak load and booster compressor station facilities described in Exhibit No. 98 which come into operation by 1943. Such additional expenses are as follows:

(a) Annual operation and maintenance of new 1,800-hp. booster stations at Cimarron, Apishapa and Colorado Springs beginning with 1940 ..... $48,600

(b) Annual operation and maintenance of 1,200 hp. peak load addition to Devine Station beginning with 1940 (p. 4434) 4,800

(c) Annual operation and maintenance of 1,200 hp. peak load additions to Clayton, Cimarron and Apishapa Stations beginning with 1943 14,400

(d) Total expenses of operating all additional booster and peak load compressor station facilities $67,800

In determining costs of operating the additional facilities, consideration was given to the fact that such stations and equipment are operated only during the winter months, but a skeleton crew would be required throughout the rest of the year. The cost of such operation is much less than

the cost of regular operation. This is shown by the fact that the average annual cost of operating and maintaining the additional 10,200 horse-power peak load and booster equipment as set forth above is only $6.65 per horse-power, whereas in 1939 the actual cost of operating and maintaining the 8,000 horse-power in Clayton, Canyon and Devine stations was $115,646, or $14.46 per horse-power.

No increase in general expenses was made on account of the additional cost of operating these additional compressor station facilities.

There is attached to the statement showing year by year the estimated annual expenses of a Denver Line for resale gas alone, grouped into the several classes of expense which were separately studied and in which the annual expenses of the added compressor facilities are separately shown. This (p. 4435) statement is reconciled with Exhibit No. 76 as follows:

(a) Total operating and maintenance expenses and operating taxes of Colorado Interstate Gas Company's part of the present system in 1939 per Line 12, Statement No. 1, Exhibit No. 76	$628,065
(b) Deductions from such expenses made in this exhibit as summarized above	76,725
(c) Annual expenses of Colorado Interstate Gas Company's part of a Denver line for resale gas alone in 1939 as shown by Column 10 of the attached statement	$551,340

The estimated total annual expenses of Colorado Interstate for resale gas only, 1928 to 1947 inclusive, are shown in the statement attached to Exhibit 136 and are as follows, together with columns showing compressor station capacity as of 1939 with added capacity 1940 to 1947 inclusive. The statement also shows a separation of expenses to the various departments of the system:

Calendar Year	Compressor Stations		Total Annual Expense
	1939 Capacity	Added Capacity	
	(1)	(2)	(10)
1928			$139,037
1929	$ 1,298		261,914
1930	36,731		376,154
1931	88,064		421,073
1932	76,660		430,319
1933	70,714		402,426
1934	72,505		402,110
1935	81,454		389,156
1936	100,534		428,943
1937	115,229		468,188
1938	113,878		471,407
1939	106,421		551,340
1940	119,200	$53,400	614,400
1941	123,800	53,400	626,600
1942	126,600	53,400	638,200
1943	129,400	67,800	666,300
1944	132,300	67,800	634,600
1945	135,200	67,800	645,800
1946	137,100	67,800	657,200
1947	139,000	67,800	667,300

The witness testified that in compiling the figures in Exhibit 136 he used the figures shown in Exhibit 135 for the years 1928 to 1939, inclusive (p. 4436). The only changes he made were to make deductions on account of less use or lesser expense of the facilities, but without trending it.

With respect to 1940 to 1947 inclusive, he took the figures in Exhibit 135 as trended, and adjusted them to arrive at the new figures. The same results would have been obtained had he trended the new figures for 1928 to 1939 inclusive (p. 4437).

25. Cost at Contract Price of All Gas Delivered to Colorado Interstate at Clayton Junction for the Denver Line.

These costs are shown in Exhibit 164. This exhibit and the testimony relating thereto is abstracted in Canadian's record and is adopted by Colorado Interstate. The costs there shown for the years 1928 to 1939 inclusive and as estimated, 1940 to 1947, inclusive, are as follows:

Year	Production	Gathering	Transmission	Total
	(1)	(2)	(3)	(4)
1928 (A)	$ 133,948	$ 16,560	$ 50,017	$ 200,525
1929	528,703	99,648	181,232	809,583
1930	916,517	160,621	471,492	1,548,630
1931	1,046,496	131,764	466,992	1,645,252
1932	957,947	120,349	466,901	1,545,197
1933	872,017	117,383	436,962	1,426,362
1934	701,603	93,258	432,420	1,227,283
1935	638,320	79,649	372,108	1,090,077
1936	665,645	95,587	372,600	1,133,832
1937	678,541	101,623	376,483	1,156,647
1938	650,537	105,309	435,038	1,190,884
1939	699,942	112,878	408,188	1,221,008
1940	699,884	113,468	510,142	1,323,494
1941	672,062	121,223	499,803	1,293,088
1942	645,475	114,692	508,103	1,238,270
1943	590,005	112,213	542,541	1,244,759
1944	576,933	109,152	521,686	1,207,771
1945	566,117	108,000	501,758	1,175,875
1946	625,352	120,927	486,372	1,232,651
1947	1,014,218	248,180	471,447	1,733,845

Note (A) 7 Months.

[Testimony of WILLIAM A. LUSK.]

Q. Mr. Lusk, you testified on direct examination last week with reference to the preparation of your Exhibit No. 164, did you not?

A. That is correct, yes sir.

Q. And I notice the title of that, the exhibit, appearing

on the cover of it was "Canadian River Gas Company Computed Costs under Basic Contract Terms; all gas delivered at Clayton Junction, New Mexico, to Colorado Interstate Gas Company, 1928 to 1947, inclusive."

Of course, the exhibit will speak for itself, but what was your purpose for the preparation of it?

A. To establish the cost of gas at Clayton Junction.

Q. Now, the computation of the figures of the cost set forth is limited, of course, in its scope to the provisions of the contract between the two companies as of January 3, 1928, I take it?

A. That is correct, yes, sir.

(Vol. XLV, pp. 6167-6168.)

* * * * *

Now, if an accountant were preparing a cost exhibit and was not limited to the terms of the contract of January 3rd, 1928, he would, of course, not be accordingly limited either in the elements that would be included in such cost would he?

A. That is right. He wouldn't be limited in the scope of his examination. I think we can clear that up by saying that if I were not limited or any accountant limited to the terms of a specific contract, in building this up I would eliminate the amortization and substitute depletion and depreciation.

Q. Yes, sir, and those would be proper elements to go into such costs?

A. That is right.

Q. And in your statement, Exhibit 91, in effect it so stated in the first page of your written statement; that is, you have amplified it now?

A. That is right.

Q. And Exhibit 164, therefore, has no reference to and is not concerned with either depreciation or depletion?

A. No, sir, only in so far as it affects Federal taxes.

Q. Only in so far as it affects Federal taxes.

A. That is right.

Q. Now, then, since it is not concerned with depletion, it—strike that.

I will ask you whether the exhibit or the scope of it is in any manner concerned as to the life of the gas field serving these properties?

A. None whatsoever. It is the life of the bond issues and notes up to 1948.

Q. It is limited entirely to the bond issues and notes up to 1948?

A. It is limited to the terms of the contract.

Q. Regardless of what the reserves of gas in the acreage owned by Canadian River Gas Company may be?

A. That is correct, yes, sir.

Q. Or regardless of what the life of that acreage in so far as producing gas may be?

A. That is correct.

(Vol. XLV, pp. 6169-6171.)

26. Cost at Contract Price of Gas Delivered to Colorado Interstate at Clayton Junction for an Assumed Denver Line for Resale Gas Only.

These costs are shown in Exhibit 167. This exhibit and the testimony relating thereto is abstracted in Canadian's record and is adopted by Colorado Interstate. The costs there shown for the years 1928 to 1939 inclusive and as estimated, 1940 to 1947 inclusive, are as follows:

Year	Production	Gathering	Transmission	Total
	(1)	(2)	(3)	(4)
1928 (A)	$ 58,443	$ 14,425	$ 62,224	$ 135,092
1929	289,616	95,091	259,202	643,909
1930	646,133	156,831	464,746	1,267,710
1931	805,787	116,457	446,370	1,368,614
1932	738,179	97,793	447,600	1,283,572
1933	618,066	88,856	424,984	1,131,906
1934	452,911	64,254	421,666	938,831
1935	419,484	56,160	373,431	849,075
1936	401,147	62,574	402,180	865,901
1937	430,365	70,080	406,003	906,448
1938	431,795	74,469	424,728	930,992
1939	435,047	74,732	445,095	954,874
1940	448,837	79,683	524,606	1,053,126
1941	431,753	86,236	498,882	1,016,871
1942	389,910	79,645	490,305	959,860
1943	377,127	77,883	545,324	1,000,334
1944	369,123	75,356	557,147	1,001,626
1945	363,761	74,608	538,442	976,811
1946	411,150	86,344	523,319	1,020,813
1947	806,314	241,083	508,518	1,555,915

Note (A) 7 Months.

[Testimony of WILLIAM A. LUSK.]

Q. I take it that these calculations that appear in Statement 9 of Exhibit 167 were reached on the same basis of the calculations on Statement 9, Exhibit 164?

A. Yes, sir, the same principle was followed throughout both exhibits.

Q. Of course, Mr. Lusk, the company is not in fact oper-

ating on the basis as indicated in this cost exhibit. They are not so segregating the items on their books are they?

A. They are segregated into certain proportions of the operating expenses divided between the systems; they segregate taxes by systems; they segregate bonds between two systems; they segregate notes and other evidences of debt between the two systems.

Q. The company is not in fact presently limiting its sale to resale customers?

A. The Canadian River Gas Company?

Q. Yes.

A. The Canadian River Gas Company doesn't make any distinction between resale customers and direct sale customers.

Q. And it doesn't make any sales at all to direct industrials?

A. Not Canadian River Gas Company, no.

Q. It makes all of its sales to—let's see. It is the Colorado Interstate Gas Company, the Amarillo Oil Company—

A. Yes.

Q. And who are the others?

A. Well, the Amarillo Oil Company is divided into several contracts and the Colorado Interstate, and the Clayton Gas Company.

Q. That is right.

A. The Canadian River Gas Company wholesale gas.

Q. Their contracts are in evidence in this proceeding. The main one, of course, we are concerned with is the contract in Exhibit 16.

A. Yes, sir.

Q. Under the terms of which, particularly Paragraph or Section 10, you have arrived at these cost figures that appear in Exhibit 164 and you have related them to resale only in Exhibit 167?

A. That is correct.

Q. But in so far as the Canadian River Gas Company is concerned, it doesn't now nor has it in the past endeavored to limit its sales to resale gas only, has it?

A. No, sir, there is no distinction of gas sales in the Canadian River Gas Company and has not been any since the company commenced operation.

Q. Nor is there any contemplated as far as you know?

A. As far as I know, no.
(Vol. XLVI, pp. 6369-6371.)

---

27. **Amortization and Depreciation.**

The company's witness Lusk testified that both companies set out to recover their investment or liquidate the indebtedness, incurred in making the investment, within the twenty-year project term. First testifying in respect to Canadian's situation and in connection with his Exhibit 91 entitled "Canadian River Gas Company, Operating Costs as Adjusted, 1928 to 1939 Inclusive" (Vol. XIX, p. 2612), he referred to the contract between the two companies (Exhibit 16) whereby Canadian was to sell gas to Colorado Interstate at "cost" and the provision that Canadian's "cost" was to include the amortization within the project term of all of its investment or the liquidation of all of its debt incurred in making investment in property used in the project. He stated that Canadian opened up its books and kept them so as to show these contract "costs" and added, "Accordingly, such system of accounts does not conform and does not purport to conform to any classification of costs in a strict accounting sense." (Vol. XIX, p. 2613). He then went on to explain that neither company in his opinion being subject to regulation, they set up depreciation and amortization accounts on their books only for the purpose of recovering their investment or liquidating their debt, incurred in making their investment, within the project term and in order to get income tax deductions. Both companies employed a rate of 5% based on a twenty-year project life for all long-lived items of property in the beginning, but because of controversy with the Federal Income Tax Department they had revised their rates (Vol. XIX, pp. 2618, 2641). As a result of this controversy with the Internal Revenue Department, the company compromised by accepting for tax purposes a twenty-five year life basis on long-lived items and made it effective January 1, 1931 (p. 2640). On cross examination he was asked:

"Q. And what had the company set up on its books before that time?

"A. The company originally started out to depreci-

ate all of its depletable property on a 20-year life basis, five per cent.

"Q. And what was the company's reason for setting them up on a 20-year life basis?

"A. It was the life of the contract." (p. 2640.)

Following that the company set up depreciation on its books on the new basis so that its books would reflect "income properly for tax purposes." (pp. 2641-42.) On direct examination, his attention was called to the terms of the contract between Canadian River and Colorado Interstate under which the sale of gas was to be made at cost, and he was asked:

"Q. I notice an item of income taxes in this statement. Will you explain how the company might have income subject to income tax under this character of contract?

"A. Well, it all came about with the rulings of The Internal Revenue Department that certain depreciation was not allowable. Therefore, the company was assessed amounts of income taxes from approximately 1931 right down to 1939.

"Q. That is to say that there is a difference between the amortizations under the contract and the amortizations, broadly speaking, that are allowed by the Bureau of Internal Revenue for income tax purposes?

"A. Well, the Bureau of Internal Revenue wouldn't allow amortization of debt to be included in amortization under any other form, under any circumstances." (pp. 2618, 2619.)

Lusk's testimony with respect to each company's original charge-off of long-lived items at a rate of 5% per annum on a twenty-year project basis, in order to recover the investment or liquidate the debt and for tax purposes, and the subsequent modifications made by the companies as a result of income tax controversies, can be better understood by including at this point a statement of these several rates used by each company, as taken off the books of the companies by the Commission's witness Kenneth L. Smith in his Exhibits 174 and 176, more fully abstracted hereafter. From page 6 of Smith's Exhibit 174, "Annual and Accrued Depreciation of Gas Plant Accounts—Colorado Interstate Gas Company," the following is taken:

Description	Bases of Accruals				
	10/1/28 to 6/30/31	7/1/31 to 4/30/36	5/1/36 to 12/31/37	Year 1938	Year 1939

Other General Equipment	5.00	5.00	25 Years
General Garage Equipment (Autos and Trucks)	33.33	33.33	33.33%

Lusk, on being cross-examined with respect to his Exhibit 170, as hereinafter abstracted, again explained that the changes in Colorado Interstate's rates and the conformation of its books to those compromise rates, as agreed upon with the Bureau of Internal Revenue, was made for such tax purposes in the same manner as was done by Canadian (Vol. XLVIII, pp. 6635-37). And the reserves now shown on Colorado Interstate's books for depreciation of physical property ($4,994,352.35 balance as of December 31, 1939; Exhibit 174, p. 21) was the result of accruals at these compromise tax rates (Vol. XIX, pp. 2640-42 and Vol. XLVIII, pp. 6634-35). Lusk also testified that its gas purchase and sales contracts had been amortized by Colorado Interstate so as to recover the investment therein within the project term. The reserves shown on the books for such amortization have been summarized by the Commission's witness Kenneth L. Smith on page 8 of his Exhibit 174, as follows:

Particulars	Total	Contracts for Purchase and Sale of Gas	City of Colorado Springs, Colo.
Balance included in plant account at December 31, 1939, per books	$2,589,607.84	$2,352,941.17	$236,666.67
Amortization rate (Note 1)		5%	5.869%
Annual amortization as reclassified; (Note 2)			
Year 1939	$ 131,536.56	$ 117,647.04	$ 13,889.52
Year 1938	131,536.56	117,647.04	13,889.52
Year 1937	131,536.56	117,647.04	13,889.52
Year 1936	131,536.56	117,647.04	13,889.52
Year 1935	131,536.56	117,647.04	13,889.52
Year 1934	131,536.56	117,647.04	13,889.52
Year 1933	131,536.56	117,647.04	13,889.52
Year 1932	131,672.62	117,647.04	14,025.58
Year 1931	124,999.98	117,647.04	7,352.94
Year 1930	117,647.04	117,647.04	
Year 1929	117,647.06	117,647.06	
Six months ended December 31, 1928	58,823.53	58,823.53	
Totals	$1,471,546.15	$1,352,940.99	$118,605.16

To this statement the witness Smith appended the following notes found on page 9 of his Exhibit 174:

"Notes:

(1) The amortization rates used by the Respondent have been designed to write off the recorded costs of, or the values placed upon, the contracts over their respective lives. The contracts for the purchase and sale of gas are being amortized on the books over the 20-year period from July 1, 1928 to June 30, 1948, the expiration date of the contracts. The recorded cost of the City of Colorado Springs, Colorado, contract is being amortized on the books from July 1, 1931 to June 19, 1948.

(2) Amortization for the six months ended December 31, 1928 and for the year 1929 was charged to surplus on the Respondent's books in the years 1931 and 1930, respectively. These charges were transferred to the income accounts of the years to which applicable on Examiner's entry No. R-137, which is included in the exhibit relating to the income account."

As to the "actual" or "observed" depreciation existing in the physical property in distinction to the book reserves just mentioned, the witness Rhodes testified that a field inspection of the Denver Line properties of Colorado Interstate showed as of December 31, 1938 the per cent accumulated depreciation and condition of the properties as follows: (Exhibit 70, p. 32.)

F.P.C. Acct. No.	Description	Accumulated Depreciation % Per Cent	Condition of Properties Per Cent
Natural Gas Transmission Plant			
351-1	Land	0.0%	100.0%
351-2	Land Rights (Rights of Way)	00.0	100.0
352-1	Pumping Station Structures	14.0	86.0
352-2	Measuring and Regulating Station Structures	13.0	87.0
352-3	Other Transmission System Structures	13.0	87.0
353	Mains	5.0	95.0
354-1	Pumping Station Equipment	12.0	88.0
354-2	Measuring and Regulating Station Equipment	10.0	90.0
General Plant			
372	Office Furniture & Equipment	20.0	80.0
373	Transportation Equipment	49.0	51.0
377	Tools and Work Equipment	20.0	80.0
378	Communication Equipment	16.0	84.0
Working Capital			100.0

On page 12 of his Exhibit 70, Rhodes stated:

> "The depreciation accumulated in the property was determined from observations of physical conditions that ultimately lead to the retirement of items of property. Depreciation as determined is separate and distinct from accruals for amortization that may be considered necessary on account of the possible termination of or major changes in Colorado Interstate's business."

The respondent's witness, H. E. Roberts, an engineer of the firm of FB&D "specializing in the valuation of industrial and public utility properties" (Vol. XCIV, p. 14413) and whose qualifications as such engineer are set forth (pp. 14413, et seq.) applied the foregoing percentages of accumulated depreciation to the original cost of the Denver Line properties of Colorado Interstate as shown in his Exhibit 283 and to the equivalent original cost of a Denver pipe line for resale gas alone in his Exhibit 284. He worked with Mr. Rhodes in making the estimate of reproduction cost, and less depreciation, of the properties of Colorado Interstate and those of Canadian River. He began that work in March 1939 and continued with it until the hearing in this case began (Vol. XCIV, pp. 14415-16; Vol. XCVII, pp. 15023-29). He worked on the problem of depreciation and the condition of the property (Vol. XCIV, p. 14416).

In his Exhibit 283, he took the original cost of Colorado Interstate's property as shown in Exhibit 67 by Mr. Lusk and rearranged the items only for the purpose of having them conform to the classification of the several items of property and their per cent condition of depreciation as shown in Mr. Rhodes' Exhibit 70. This was done in order to have an exact comparison or identity of the property but did not affect the total original cost as shown in Mr. Lusk's Exhibit 67 (Vol. XCVII, pp. 15004-05). Applying the percentages of accumulated depreciation, he arrived at the following: (Exhibit 283, Statement 1.)

Colorado Interstate Gas Company.
Accumulated Depreciation of Original Cost of Physical Properties of the Denver Line as of December 31, 1938.
Summary by Accounts.

Item No.	Account No. (Exch. No. 70)	Account No. (Company)	Description	Original Cost (A)	Accumulated Depreciation	
					Per Cent	Amount
(1)	(2)	(3)	(4)	(5)	(6)	(7)
	Transmission System					
1	351-1	218	Land	$ 19,949	.....	.....
2	351-2	220; 219	Rights of Way and Leasehold	174,391	.....	.....
3	352-1	221; 223 224; 227	Compressing Station Structures	495,235	14.0%	$ 69,333
4	354-1	224; 227	Compressing Station Equipment	1,102,031	12.0	132,244
5	353	226	Transmission Line Equipment	8,636,798	5.0	431.840
6	352-2	222; 227	Measuring Station Structures	54,627	13.0	7,102
7	354-2	225	Measuring Station Equipment	88,412	10.0	8,841
8	352-3	223; 227	Other Transmission System Structures and Equipment	68,408	13.0	8,893
9			Total Transmission System	$10,639,851		$658,253
	General Property					
10	378	255	Telephone System	147,106	16.0	23,537
11	372	249	Office Equipment	30,012	20.0	6,002
12	373	253	Garage Equipment	62,521	49.0	30,635
13	377	256	Tools and Implements	36,956	20.0	7,391
14	Total Direct Cost			$10,916,446		$725,818
15	General Construction Costs			1,136,200		37,773
16	Total Original Cost			$12,052,646		$763,591

Note: (A) As shown on Exhibit No. 67.
Adjusted as shown on Statement No. 3 herein.

Following the same method in his Exhibit 284 he arrived at the following for a Denver pipe line for resale gas alone: (Exhibit 284, Statement 1.)

Colorado Interstate Gas Company.

Accumulated Depreciation of the Equivalent Original Cost of a Denver Pipe Line for Resale Gas Alone, as of December 31, 1938.

Summary by Accounts.

Item No.	Account No. (Exch. No. 70)	Account No. (Company)	Description	Original Cost (A)	Accumulated Depreciation	
					Per Cent	Amount

12	373	253	Garage Equipment	62,521	49.0	30,635
13	377	256	Tools and Implements	36,956	20.0	7,391
14	Total Direct Cost			$ 9,698,978		$662,921
15	General Construction Cost			1,038,595		35,494
16	Total Original Cost			$10,737,573		$698,415

Note: (A) As shown on Exhibit No. 134.
Adjusted as shown on Statement No. 2 herein.

On being cross-examined with respect to these two exhibits as well as with respect to analogous Exhibits 272, 273, 274 and 275 of Canadian, he testified as follows: In his Exhibits 283 and 284, he is relating the percentages arrived at to the very property that he and Mr. Rhodes inspected (Vol. XCVII, p. 15036). He and Mr. Rhodes had a crew that worked under their supervision. He and Mr. Rhodes gave instructions as to the method of inspection and set up an organization with Mr. Smith in charge and their instructions were carried out, although neither he nor Mr. Rhodes personally inspected each item (p. 15039). In determining the "actual or existing depreciation", they did not take into consideration the life of the property or how long it had been in the ground or in place, but determined its per cent condition as disclosed by field inspection (p. 15045).

> "The per cent condition as we have employed it, represents the extent to which the property has depreciated as compared with the total depreciation that would cause that property to be retired." (p. 15048.)

And his determination was made from observation of the physical condition of the property. The figures arrived at make no allowance for amortization of the property in any way for any cause (p. 15052). He and Mr. Rhodes approached the problem primarily as an engineering problem and both determined per cent condition or accumulated depreciation from physical inspections of the property (p. 15059). The per cent conditions of depreciation arrived at do not take into account or give effect to amortization of any kind (p. 15066). As to the percent condition of depreciation, he stated:

> "We found it based upon what maintenance had been done, had taken place." (p. 15075.)

No depreciation was taken with respect to lands and right of ways, because land does not depreciate. If the property is abandoned or ceases as an operating property, the right of way has no value (p. 15109). Determination of per cent condition of actual or observed depreciation did not require, and he did not make, any determination of service lives (p. 15110). Actual depreciation can't be determined on the basis of service lives.

"I think the proper method is to go out in the field and inspect it as we have. I feel we have the amount of depreciation that exists in this property.

* * * * *

"Q. Regardless of what the company may record on its books?

"A. That is right." (pp. 15144-45.)

As to retirements, he said:

"We didn't estimate what the retirements would be in the future as we were inspecting the property that existed at that date." (p. 15117.)

As to the possible salvage value of any of Colorado Interstate's properties, when its business ceased for any cause, the Commission offered the statement of its engineer Hill, who stated that at the end of the service lives of the several items of such property determined by him (Exhibit 178, p. 2, abstracted more fully hereinafter), such salvage would be "negligible." The respondent company presented evidence on salvage in its Exhibit 282, prepared jointly by the witnesses H. P. Taubman, W. D. Smith and E. M. Solow (Vol. XCVI, p. 14913). These same witnesses testified with respect to salvage in the case before the Commission involving Natural Gas Pipe Line Company of America and Texoma Natural Gas Company (Docket No. G-112). They fixed their salvage value as to such items as could be salvaged primarily as of January 1, 1956, but their testimony was to the effect that a great part of the property, and particularly the transmission line could never have any salvage value. Testifying, Mr. Solow said:

"There are certain items like pipe in the main lines that will cost so much more to be salvaged than to leave in place that they are abandoned in place. The figures that are included in circles represent the loss which would be incurred if they were taken up and scrapped. They were just left in place because there would be no sense in that operation." (p. 14912.)

Taking into consideration all factors, such property as could be salvaged was determined to have a value not in excess of $131,019.95 for all of Colorado Interstate's property and investment.

The Commission did not offer any evidence as to salvage except the statement referred to above of its engineer Hill to the effect that after the fifty-year life assigned to the transmission line, and shorter lives assigned to other items of property by him, the salvage would be negligible.

The Commission's accountant Kenneth L. Smith, in his Exhibit 174 (Vol. XLIX, p. 6783) took the book accounts of the company both for depreciation and amortization and changed and recast them retroactively back to the beginning of the project in 1928.

As to the company's accounts for amortization of its contracts, which Smith called "amortization of franchises and contracts," he eliminated all such accounts from further consideration because it was his opinion that such contracts ought not to be part of the "original cost" or investment of the company for regulatory purposes (See his Entry 404, Exhibit 174). Following this elimination of amortization by Smith, the Commission's accountant Early in his Exhibit 140, abstracted supra, eliminated from the company's annual expense all annual requirements for amortization. On this account, Early eliminated $131,536.56 for each of the years 1937, 1938 and 1939 and his "net utility income" was correspondingly increased for each of said years (Exhibit 140, pp. 18, 19 and 20).

As to depreciation Smith said:

> "This report sets forth the annual and accrued depreciation of the gas plant accounts of Colorado Interstate Gas Company for the years 1928 to 1939, inclusive." (p. 6783.)

And again:

> "The chief purpose of the entries is to adjust the annual provisions for depreciation and amortization expense and, concurrently, to adjust the reserve for depreciation so that it will properly reflect the depreciation legitimately accrued on gas plant." (p. 6786.)

And again:

> "Schedule No. 6 is an analysis of the reserve for depreciation for gas plant in service, as adjusted, for the period beginning with the inception of the company in 1928, and ended December 31, 1939." (pp. 6790-91.)

Smith in this Exhibit 174 took the reserve for depreciation as shown by the books in the amount of $4,994,352.35, balance as of December 31, 1939, and eliminated therefrom the amount of $2,343,971.77, leaving an adjusted balance of $2,650,380.58. The difference, he said, "consists chiefly of the variation in the provision for depreciation charged on the books and the amount of the provision as computed by the Examiner, based on the service life estimates of the Bureau of Engineering."

(Vol. XLIX, p. 6785.)

By Entry 402, he adjusted the reserve by a credit thereto of $10,233.36 "to correct the respondent's accounting in the depreciation reserve for the retirement of the Clayton lateral line, measuring station and equipment sold to Canadian River Gas Company as of June 1, 1933."

Entry 403 reverses respondent's annual provision for depreciation. Following that action of Smith, the Commission's witness Early in his Exhibit 140 (pp. 18, 19, 20) abstracted supra, reduced the respondent's expenses for annual depreciation requirements to conform to Smith's action by the amount of $236,021.37 in 1937; $160,161.53 in 1938; and $162,993.65 in 1939. These reductions in annual depreciation charges increased Early's "net utility income" for those years in corresponding amounts.

By Entry 405, Exhibit 174, Smith eliminates from the depreciation reserve account $31,729.53. "The net amount of profit and loss on retirements which have been shown in the reclassified income statements as charges or credits to income."

By his Entry 406, Exhibit 174, he sets up a reserve for depreciation of gas plant in service as of December 31, 1939 in the amount of $2,819,797.11, and in addition a reserve of $3,663.18 of gas plant held for future use. This was done "to record the annual depreciation for gas plant in service based on the service lives estimated by the Bureau of Engineering."

By Entry 407, Exhibit 174, Smith removes from the reserve for depreciation of gas plant in service and charges to reserve for depreciation of gas plant held for future use $1,319.04.

On cross-examination, he testified that he used the service lives furnished by the Commission's Bureau of Engineering and that they had fixed a fifty-year life for the transmission line (Vol. L, p. 6869). If the life of the field is fifty years, then he does not believe that the fifty-year life will provide an adequate reserve so far as the main transmission line is concerned except for one qualification, and that is, that any underestimate in one class might tend to be set offset by an overestimate in another group or class of property (p. 6877).

> "Q. What I have in mind is this: The principle that seems to underlie this question as it relates certainly to the natural gas property, is that your service lives are the number of years over which you accrue depreciation of physical property must be a lesser number of years than the number of years in which the supply of gas will be exhausted?
>
> "A. I believe that is exactly right and I have taken great pains to find out and ascertain basically, relying upon the engineers on our staff that that was the situation; that we were not getting ourselves into a very embarrassing situation in that respect." (pp. 6878-79.)

He satisfied himself that the life of the field was longer than the service lives of fifty years fixed by the Commission's engineers (p. 6883). He did not mean to imply that the company's books were improperly kept (p. 6891). The assumption has been made by the Commission engineers that the project would continue as long as there was a supply of gas available without regard to the contracts with the customers of Colorado Interstate such as the Public Service contract which ends in 1948 (p. 6904).

The service lives of the physical properties of respondent are determined by the Commission's Bureau of Engineering as set forth in Exhibit 177 (witness Hill, Vol. L, p. 6960). The service lives were based primarily on the physical life but consideration was given to retirements because of inadequacies, obsolescence or requirements of public authorities. The probable life of the natural gas supply was taken into consideration and it was assumed that the company would be in business as long as a supply of natural gas was available, and that it would be in business beyond the

service lives of the properties. The net salvage value of the physical property on retirement for any cause was considered to be negligible. There is attached to the exhibit a statement of the service lives, which is fifty years for most of the transmission system; thirty to forty-eight years for structures; twenty to thirty-six years for various items of equipment; and four years for garage equipment; and twelve and one-half years for office equipment.

On cross-examination the witness Hill testified (Vol. LI, p. 7008) that the company kept its property in good repair and that the retirements did not amount to a great deal. The life of the field, he thought, would be longer than the service lives set (p. 7023). He realized that the life of the property for the purpose of accruing depreciation should be less than the number of years that the gas supply would be available, but he thought that somewhere from six to ten years beyond the fifty-year assumed physical life of the pipe line would be adequate to balance off any replacements that had been made prior to the expiration of fifty years (p. 7024). Thirty-six years had been assigned as the service life of compressors. The installation of compressors in the latter part of his sixty-year assumed life of the field would present a different problem for the purpose of accruing depreciation.

"Q. That is, you recognize that limitation of field life is a very positive and determining factor in your service lives?

"A. I think it is, yes, sir, although I think those compressor engines will last much longer than the composite life of each.

* * * * *

"Q. If in the future that field life basis were changed, then the service lives which you have given here might be revised either up or down depending upon what the change of conditions was, I take it?

"A. I think so." (Vol. LI, pp. 7025-26.)

Further Testimony of the Commission's WITNESS, SMITH.

Q. Mr. Smith, in connection with the preparation of this Exhibit 174 did you also prepare a written statement setting forth the main items briefly?

A. Yes, I have.

Q. Will you please read that statement into the record?

A. "This report sets forth the annual and accrued depreciation of the gas plant accounts of Colorado Interstate Gas Company for the years 1928 to 1939, inclusive. By account classification, it shows annual accruals of depreciation based on service life estimates furnished by the Bureau of Engineering of the Federal Power Commission, and also original cost of property retired, salvage on retirements, and other credits as adjusted by this and other Examiners.

"A comparison of the Reserve for Depreciation of Gas Plant in Service per books and that Reserve as adjusted by the Examiner is as follows:"

Mr. Lange: May that table be copied into the record, Mr. Examiner?

The Trial Examiner: Yes.

(As directed by the Trial Examiner, the following table was copied into the record:)

Components of Reserve for Depreciation
1928-1939.

	As Adjusted By Examiner (Schedule No. 1) Column 3	Per Books (Schedule No. 5)	Difference
Provision for Depreciation Charged to Expense	$2,819,797.11	$5,350,774.06	$2,530,976.95
Charged to Plant Account	13,675.74	13,675.74	
Retirements Original Costs Retired	(281,705.03)	(280,934.47)	770.56
Salvage	98,039.24	127,282.88	29,243.64
Adjustments of prior Years' Depreciation through Surplus	....	(219,404.79)	(219,404.79)
Profit and loss on Retirements (net)	....	2,387.17	2,387.17
Miscellaneous	573.52	571.76	(1.76)
Balance in the Reserve, December 31, 1939	$2,650,380.58	$4,994,352.35	$2,343,971.77

The Witness: "The great difference between the balance shown on the books as of December 31, 1939 ($4,994,352.35) and the accrued depreciation as of that date as computed by the Examiner ($2,650,380.58) consists chiefly of the variation in the Provision for Depreciation charged on the books and the amount of the Provision as computed by the Examiner, based on the service life estimates of the Bureau of Engineering. This the tabulation above clearly indicates.

"The Examiner's adjustments were effected through the medium of eleven journal entries, eight of which, Entries Nos. 400 to 407, inclusive, were made by this Examiner and three of which, Entries Nos. 204, 213, and 215, were made by another Examiner."

By Mr. Lange:

Q. Right there, who was the other Examiner, Mr. Smith?

A. That would be Examiner Schutte in his report on the gas plant account of Colorado Interstate Gas Company. I believe that was Exhibit 139.

Q. 139, yes. All right, go ahead.

A. "The entries made by this Examiner are contained in this report and the entries by another Examiner in a report entitled 'Gas Plant Accounts and Examiner's Adjustments.' The entries are principally of two kinds: those that affect only the reserve for depreciation and serve to adjust the amounts of the several elements of the reserve, which entries are denoted by the letter 'R' prefixed to the numeral, and those entries that involve not only the reserve for depreciation, but one or more other accounts as well.

"In addition, there is one adjusting entry (No. 404) which reverses the company's amortization of franchises and contracts. The chief purpose of the entries is to adjust the annu provisions for depreciation and amortization expense and, concurrently, to adjust the reserve for depreciation so that it will properly reflect the depreciation legitimately accrued on gas plant.

"The company's reserve for depreciation and depreciation expense accounts are incorrect and require adjustment for several reasons:

"(a) the annual depreciation rates used by the company have varied (cf. Summary attached to Adjusting Entry No. 403), (b) accrued depreciation has been restated by the company by entries made directly to surplus, (c) the revised annual depreciation rates made effective by the company as of January 1, 1938, were adopted by it without its bringing accrued depreciation into conformity with them, and (d) during certain periods retirement losses were charged to the reserve for depreciation and in other periods such items were charged to an income account.

"Besides this the fact that plant account balances as shown on the company's books have been adjusted by an Examiner of Accounts, and that service life estimates different than the company's have been developed by the Bureau of Engineering also had to be considered. On the assumption that these adjustments to plant account and

these estimates of service life were correct, the company's reserve for depreciation and depreciation expense accounts needed adjustment on this score. The explanation given as a part of each entry states the specific reason and the basis for each adjustment.

"Following the journal entries, on Page 14, appears Schedule No. 1. This tabulation contains the information described in the first paragraph of this text except that it gives this information by major functional groups of plant rather than by accounts. It shows gas plant in service divided into three classifications, i. e., transmission system, distribution system, and general and undistributed fixed capital; it also shows gas plant held for future use. Each of the three classifications of gas plant in service shown in Schedule No. 1 is supported by a schedule which gives information of the kind shown on Schedule No. 1, by subclassification.

"Schedules Nos. 2 and 3 each show four subclassifications of transmission system and distribution system plant, respectively, and Schedule No. 4 shows general and undistributed fixed capital broken down into four subclassifications. In turn, Schedule No. 2 is supported by Schedules Nos. 2A, 2B and 2C, which respectively classify main lines and laterals into one main line and sixteen laterals, and compressing stations and other structures and equipment into structures, equipment, and several other subclassifications.

"The information given on the first five lines of Schedules Nos. 1 to 4, inclusive, and their subschedules are explainable as follows:

"Line No. 1, original charges per books, represents the cost of the company's initial construction plus subsequent gross additions, exclusive of construction work in progress and gas plant adjustments. In most instances, therefore, the amounts on Line No. 1 may be arrived at by adding to the December 31, 1939 balance per books all retirements from the inception of the company to December 31, 1939, exclusive of construction work in progress and gas plant adjustments.

"Line No. 2, Examiner's Adjustments, represents the net adjustments to these plant accounts made by the Examiner

who prepared the report entitled 'Gas Plant Accounts and Examiner's Adjustments.'

"Line No. 3 is the sum of Lines Nos. 1 and 2 and represents the adjusted total cost subject to depreciation.

"Line No. 4 represents total retirements from the inception of the company to December 31, 1939, as adjusted.

"Line No. 5 is the difference between Lines Nos. 3 and 4 and represents the adjusted balance in the plant accounts as at December 31, 1939. The amounts on Line No. 5 agree with the adjusted totals shown in Column 7 of Schedule No. 1 of the report entitled 'Gas Plant Accounts and Examiner's Adjustments.'

"The depreciation was computed annually based on the adjusted balances in each plant account. In a majority of instances the appropriate annual depreciation rate was applied to the adjusted plant account balance at the beginning of the year. If a substantial item of plant was added during the year, six months' depreciation was as a rule computed on that item in the year acquired. In the case of compressing stations, however, each station was depreciated from the approximate date placed in operation. All minor plant additions and retirements were, for the purposes of this study, ignored for the year in which they occurred. They were, of course, taken into account in succeeding years.

"The depreciation rates used in these computations are, in general, based on service life estimates furnished to the Division of Accounts by the Bureau of Engineering.

"With respect to two lateral lines and measuring stations which were disposed of in 1939, costs adjusted for salvage were written off or depreciated on the basis of the actual periods of service while owned by Colorado Interstate Gas Company, rather than on the basis of any estimate of the total service life of the property.

"The computation of depreciation on garage equipment, which is included in Schedule No. 4, was handled in a slightly but not essentially different manner than other depreciation computations. The total cost of the autos and trucks purchased in any one year was considered as a group, and after that group cost had been fully depreci-

ated, which was usually about four years after the year of purchase, no further depreciation was accrued on that group.

"It will be noted that there were no charges to the reserve for depreciation for costs of removal. The company consistently charged these costs to expense. We have made no adjustment for them because they could not be determined without an unjustifiable amount of detailed analyses of payrolls, trucking tickets, and other records. Approximately 75 per cent of retirements were of such a nature that they involved no removal costs.

"Schedule No. 5 is an analysis of the reserve for depreciation for gas plant in service, per books, for the period begun with the inception of the company in 1928, and ended December 31, 1939, and shows the debits and credits to the reserve classified by years in the manner set forth in the tabulation in this text, above.

"Schedule No. 6 is an analysis of the reserve for depreciation for gas plant in service, as adjusted, for the period beginning with the inception of the company in 1928, and ended December 31, 1939. The classifications given in this schedule are the same as the major classifications shown in Schedule No. 1 and show the debits and credits to the reserve classified by years in the manner set forth in the tabulation in this text, above.

"The minor difference in the amounts as classified, as shown by the tabulation in the text and by Schedule No. 6, is caused by a variation in the classification of $2,344.14. In Schedule No. 6 this amount is classified as a miscellaneous credit, but in the tabulation in the text it is eliminated as gas plant held for future use (cf. Schedule No. 1).

"Schedule No. 7 gives the retirements of plant costs charged to reserve for depreciation, per books and as adjusted, providing a recapitulation of the Examiner's Adjusting entries that affect retirements. It shows the retirements as adjusted by years by plant accounts; it supports Line 4 of Schedule No. 1.

"Schedule No. 8 sets forth the salvage credited to the reserve for depreciation in the same manner and in the

same detail that retirement data is tabulated in Schedule No. 7. It supports Line 21 of Schedule No. 1."

(Vol. XLIX, pp. 6783-6791.)

* * * * *

Cross Examination.

By Mr. Dougherty:

Q. Mr. Smith, I take it that you assume no responsibility for the service life estimates which were furnished by the Bureau of Engineering.

A. As to supporting them, no I do not.

Q. You just accepted them as they gave them to you?

A. I have accepted them and I have no reason to consider them unreasonable to the best of my knowledge.

Q. Well, a matter of determining service life is primarily an engineering matter rather than an accounting matter.

A. That is true.

(Vol. XLIX, pp. 6792-6793.)

* * * * *

Q. Do you have when you get your service life the element included in there of depreciation which I think is referred to as "functional"?

A. It is my understanding that the engineers have carefully considered and have arrived at conclusions in arriving at functional depreciation. It is not a part of my study.

Q. Well, do you recognize that in a business dealing with an exhausting resource or asset, such as a coal mine or gold mine or oil well, or natural gas company, that you have a problem of the ending of that operation for reasons other than the mere ending of service life for physical units of property?

A. One in accounting frequently comes into contact with the fact that that probably exists. For example, a coal mining company often pays dividends out of its depletion reserves and I understand that it is legal for it to do that, and you see evidence of those things, but as far as taking those factors into consideration and setting a rate of depreciation that is to be accrued, of course, that is purely an engineering problem.

Q. Assuming that you were the accounting officer for a coal mine and you had the various physical facilities, the tracks, the tipples, and whatever other machinery they use around a coal mine, and the engineer came in and said to you that the service life of that property was fifty years, would you consider it any part of your duty to inquire of him whether or not the economic life of the coal mine would be fifty years, that is, whether the coal mine would last that long?

A. You mean, in other words, if its reserves would be exhausted before that time?

Q. Yes, wouldn't it be a part of the responsibility of the accounting officer to find out whether the reserves would be exhausted before fifty years' time?

A. Of course, he couldn't make that determination up on his own account. You mean he would have to rely upon his expert—

Q. All right, but isn't it part of his duties to make inquiry and consider it, and if not, to have it considered?

A. Of course, as an accounting officer I think his responsibilities would end with the authority and responsibility that had been delegated to him by the management of the company or by the directors in any particular instance.

If the management of the company had instructed the accounting officer to have used the service lives and delegated the responsibility of setting proper service lives forth to the engineers for the coal mining company, I am not so certain but what the accounting officer would have discharged his real responsibility.

Now, if he had any reason to doubt the competency of the engineers who gave the estimates or felt that it was necessary to inquire into their procedure, I think it would be a responsibility for him to do that because he would want to see some support, some sort of a statement from the engineers as to their methods, but he couldn't pass upon whether that method was technically sound.

Maybe I have gone all around your question and haven't wound up at the exact point you wanted me to, but if this accounting officer had knowledge of the fact and knew it either through reliable information that he had obtained, or otherwise, information upon which he could rely, and

he knew the exhaustion of those resources would take place before the service lives set for the physical property, then obviously he would not be using good accounting practice not to go into it further.

Q. My question is this, that the accounting officer is the principal and responsible accounting officer of the company; that he has been told by the president that he can use all of the engineering figures made by the engineers but that he was going to hold you responsible. The next step was that you called in your engineers who gave you a service life. Don't you feel that it is the responsibility of that officer to find out whether the engineers have considered the exhaustion of the coal and what consideration they have given to it even though you don't know a thing about it?

A. Yes, I believe that would certainly be a higher class practice than to ignore or overlook it.

Q. Isn't the first thing an accounting officer would do would be to check with the engineer as to the relationship of his service life to your estimates of the exhaustion of this coal mine? Isn't that one of the first questions you would ask?

A. I think that he would have to recognize that relationship and he ought to be satisfied on that point but he couldn't make the determination.

Q. No, but I say this: Wouldn't he have to say it had been made and given consideration?

A. I believe in order to follow out his resposibility as chief accounting officer on a high plane from a professional and ethical standpoint, he would have to make some investigation that he would have to rely upon in forming his opinion as to the estimate by technical experts in that field.

Q. Now, do you recognize in such a case as a coal mine that by the time that the exhaustions of the coal had taken place there should have been accrued a depreciation reserve sufficient to retire all of the physical property used in connection with that coal mine less salvage?

A. That is correct.

Let me restate it to you to make sure that we are on the right track.

A. By the time the exhaustion of the mineral deposit is made there must also be enough money in the depreciation reserve to retire the equipment less salvage, less net salvage?

Q. That is right. That is my problem.

A. Yes, that is exactly right and that is in accordance with sound and accepted accounting practices.

Q. That would be true even if the physical service life of the equipment were a greater number of years than the period of life of the mineral deposits, that is, to put it specifically, let's assume that the physical service life of the equipment was fifty years for each piece of equipment and that the exhaustion of the resources would take place in forty years; you would have to base your depreciation on forty years rather than on fifty years?

A. Yes, that is correct.

Q. Now, in connection with that problem, do you know whether in this case—that is, the current case at hand—the engineers based their 50-year life of transmission line pipe of Colorado Interstate Gas Company on the physical factors or did they give any consideration to the exhaustion of the source of supply of gas which goes through that line?

A. They, as I understand it, did give consideration to the exhaustion of the source of supply of the gas which moves through that line. I don't know the particulars of that but I do know that it was considered and that the source of supply and the availability studies do have detail from an engineering standpoint in such a way there was no flaw in the service lives they adopted.

That is my understanding of the situation, that is, the understanding upon which I have proceeded.

Q. You say there is no flaw in it; is that your own judgment?

A. No, that is my understanding, that there is no flaw in it.

Q. That would apply with respect to that part of the Canadian River Gas Company's property from Bivins north, the same 50-year life as assigned, because you have used two per cent in the exhibit on transmission line?

A. It seems to me that the situation there is entirely comparable to the main line of the Colorado Interstate Gas Company.

Q. Do you know whether or not the fifty years is the life of the field or is the physical life of the pipe, or is it a composite figure that has been arrived at after giving consideration to both the physical and functional factors as involved in this matter?

A. It is my understanding the physical and functional factors have all been given proper consideration from an engineering standpoint.

Q. I assume that the period of exhaustion of the gas reserves would not be less than fifty years, which is the service life used; that is, isn't that a fair assumption to make?

A. I believe from everything I have said here and the evidence that is in my exhibit, you could fairly conclude that.

Q. Now, in the method you used, Mr. Smith, where you have a fixed service life which we estimate as—which we might say is conterminous with the period of life, isn't there this problem that will arise:

Let's assume that—withdraw that.

I notice in connection with that—I think it is on Page 16 regarding—

Mr. Lange: What exhibit?

Mr. Dougherty: Exhibit No. 174.

Q. (Continuing) —of the La Junta lateral, which is Column 13. That happens to be 2-½ per cent, for which reasons I assume it is a shorter service life, but the principle I have in mind will be illustrated irrespective of the service life if the service life is the same number of years as the period of exhaustion in the field.

I notice that you show retirement down in Line 20 in the amount of $4,000. That, as I understand it, represents five or six thousand feet of pipe, is that your understanding?

A. Well, I would have to get the working papers out to refresh my recollection upon that.

Q. Let's assume it is, and if it turns out later it is wrong, you can correct me.

That pipe, as I understand it, was removed.

Where would the schedule show when it was retired, Mr. Smith? on what page?

A. I don't know whether I can find it or not.

Q. I thought there was one schedule that showed retirements by the years.

A. Yes, I think it is there.

Q. Is that Page 23?

A. I don't believe that item will show up on Page 23.

Q. It doesn't show up?

A. No, sir. I don't think you can identify that particular item; that is, as to the exact year in this exhibit.

Q. Well, it took place some period ago; it doesn't make much difference as to the exact year, but that pipe was retired. Do you know that replacements were installed?

A. If that is a retirement of pipe, why, I think it follows that there would have been a replacement.

Q. Let's assume for the point I want to discuss with you—

A. It is just a theoretical question, anyhow?

Q. No, this actually happened, because I think, as I understand it, at the end of the period of service life here, to the extent that we have made replacements, you will never be able to depreciate them one hundred per cent as you have computed them, and that is what I want to discuss with you.

If that replacement is made, say, at the end of ten years, there would have been accrued against that particular cost of property twenty-five per cent, two and one-half per cent per year, ten years, being twenty-five per cent, isn't that correct?

A. If you want to make an allocation, that is what you would have to assume in your allocation.

Q. To the extent of whether you allocate it or not, to the extent that number of dollars went into the plant account and accrued at 2-½ per cent per year against the whole plant account, there would have been 25 per cent against the original cost of that property which is now being retired and accrued into the reserve?

A. Of course, this is group retirement—

Q. I understand that, but I think it will work out the same when we get to the end.

A. I think so, too, but I just want to point out that under that method of depreciation accounting, you were not assuming that any particular piece of pipe had so many dollars accrued against it specifically. Do you see what I mean?

Q. Yes.

A. It is a process of allocation but probably that won't make any difference to the discussion we want to pursue.

Q. Now, that pipe having been retired, the original cost of it would be taken out of the plant account?

A. That is correct.

Q. Then the cost of replacement would be added to the plant account?

A. That is correct.

Q. And you would charge against the reserves the original cost of the pipe retired?

A. Less salvage.

Q. Now, as you go along year by year and have made replacements and have made retirements, suppose you come to the end of your service life period. Instances such as I have mentioned result, do they not, in your not having accrued at the end of your service life period enough depreciation to completely restore or repay the cost of all the property, including replacements which has been put into that line?

A. You are thinking of the Colorado Interstate Gas Company, we will say, as of June 30, 1978?

Q. Right.

A. And what you are saying is that under this method we followed here the depreciation reserve on that date can't possibly be equal—be as great as the original cost of the property on the books as of that date?

Q. It can't possibly be so if there have been any retirements or replacements?

A. In order for what I said to be true, we would have to assume there is a 50-year life on all of the property.

Q. Let's take main transmission line because I think we are in agreement on that, the main transmission line with fifty years' life. Isn't it correct that at the end of the 50-year period you couldn't possibly have accrued the complete original cost of that pipe line if during the 50-year period you made retirements and replacements and the reserve on

June 30, or June 1, whichever it would be, in 1978 could not possibly be the number of dollars that the original costs show?

A. I take it that you are assuming that there would have been no extraordinary losses written off through a special way or anything like that?

Q. That is right, just as I understand the Code of Accounts, in that two sections of pipe or more constitute a retirement unit, is that correct?

A. That is my understanding of the retirement units that are laid down in Appendix 1 of the Uniform System of Accounts for natural gas companies.

Q. As I understand it, every time Colorado Interstate Gas Company takes up or has to replace two or more continuous lengths of pipe, the retirement must be charged against the reserve and the new lengths of pipe must be put into capital?

A. That is my understanding.

Q. That is, we couldn't expense it; we couldn't charge it as maintenance?

A. Not two lengths or more.

Q. I assume from your treatment at the end of your 50-year period—maybe there is only $1,000 of retirements during the whole fifty years—we couldn't possibly have accrued a reserve that would equal the original cost?

A. Yes, I think we are in agreement on that. I think that is correct.

Q. Doesn't that mean this, Mr. Smith, that when you talk about service lives, having particularly in mind the physical service life, that will give way before the service life you have assumed will to some extent be balanced off by the pieces of pipe that extend for a longer period than your service life; isn't that essential in order to make this method of accounting adequate in producing a reserve?

A. You are assuming that you want one hundred per cent reserve at the end of fifty years?

Q. I certainly am. It is exactly that. As I understand it, this figure represents the functional factor in depreciation and I am assuming, since I have not yet been told, that fifty years is the life of the field.

A. That is the point I was wanting to get to. I think the answer to your question depends entirely upon the supply of gas.

Q. So let's assume—I think we are right together on it—that fifty years is the length of supply of the gas; then wouldn't you have to use less than a 50-year service life in accruing your depreciation annually unless fifty years was the minimum service life of every piece of property and every unit of property in that pipe line?

A. I don't think your last statement that follows is applied to the plant as a whole.

Q. I am limiting it to the pipe line.

A. You are just talking about the pipe line?

Q. The main transmission pipe line. If the life of the field is fifty years, then isn't it erroneous as an accounting matter to take fifty years of the service life for the purpose of determining your annual accruals?

A. I think I can answer that this way: —I am answering it from an accounting viewpoint.

Q. That is what I want.

A. If the supply of gas is exhausted and no other gas is available—I mean, if the supply of gas—if the present supply of gas is exhausted and there is no other supply available—

Q. That is right.

A. — then I don't believe that the 50-year life will provide an adequate reserve so far as main transmission lines alone are concerned—

Q. That is what I am talking about.

A. —but, of course—may I go ahead?

Q. Yes. I can take up the other matter later.

A. I just wanted to add a slight qualification there. I don't know whether it is significant or not, but it might be; that is, that any underestimate in one class of property might tend to be offset by an overestimate in another group of property, looking at the property as a whole.

Q. That is, of course, a matter of practical judgment and not accounting principles, isn't it: that is, from the accounting standpoint, and don't we want to make each classification of property as close to being accurate as we can and not depend upon the chances of this being off?

A. Of course, that would be the most desirable, naturally, but I just want to point out that in the final analysis we are interested in retiring the property as a whole.

Q. Mr. Spencer points out that you have to depend upon

an error made in some other classification to correct the errors made here.

A. I wouldn't say there would be errors, because these estimates are a matter of judgment, I presume, in the final analysis, and I wouldn't want to say they were errors.

Q. What I have in mind is this: The principle that seems to underlie this question as it relates certainly to the natural gas property, is that your service lives are the number of years over which you accrue depreciation of physical property must be a lesser number of years than the number of years in which the supply of gas will be exhausted?

A. I believe that is exactly right and I have taken great pains to find out and ascertain basically, relying upon the engineers on our staff that that was the situation; that we were not getting ourselves into a very embarrassing situation in that respect.

Q. So you would have to have, as far as main lines are concerned, a life of the field greater than fifty years for a sufficient period to balance off these early retirements against the property that lasts more than fifty years?

A. I think that is correct and that has been recognized, of course, and I believe that we dealt with it properly.

Q. Now, then, the other pieces of pipe here upon which you have two and one-half per cent for laterals at that time, that represents a 40-year service life?

A. That is right.

Q. I notice now in respect to two of these properties that were disposed of you in studying up your depreciation have fully depreciated the original cost over the number of years in which the pipe was in service, is that correct?

A. That is over the period that this property was in service and it belonged to Colorado Interstate Gas Company.

Q. Yes, that is what I mean.

Of course, you were able to do that because that transaction had taken place before you took up this job?

A. Yes, we took some advantage of hindsight because we wanted our accounting to be just as accurate as we could make it.

Q. But it is based on hindsight and doesn't reflect any-

thing that the company knew at the time they constructed the line?

A. I said that it was based on hindsight; it was based more upon an accomplished fact.

Q. When the company first started to accrue depreciation, for example, on this Littleton lateral, of course, if we assume it [illegible]n didn't know in 1939 it was going to transfer that to the Public Service Company of Colorado, it would have no reason to accrue 9.52 per cent per year from the beginning?

A. No, they couldn't have used that figure even if they knew they were going to transfer it, because they couldn't have predicted they were going to do it and they couldn't have used that figure.

Q. So that, using whatever the percentage they could use, is there any provision made in your method of accruing depreciation to recover that difference through some charge to expense that gets it out at the time the property goes out of service?

A. You mean where a company had gone along and had depreciated this property the same as its other laterals, we will say, and then disposed of the property and then found it didn't have sufficient reserves?

Q. Yes.

A. You might take a look at Account 141, Page 23. That may offer some solution to the situation.

Q. Well, how will you ever get that loss out of the operating expenses if you use this account?

A. As I understand the use of this account it would cover the situation at hand because the retirement of the property through a cause which could not have been reasonably foreseen and provided for at the time of the original service life estimates and apparently would not be provided for by that means; therefore, I believe that we are correct in assuming that the loss would be chargeable to this account under the conditions specified in the account which requires authorization from the Commission to use the account.

If this extraordinary loss ever got into operating expenses; that is, under the conditions we are talking about, it would have to be through approval of the Commission for the company to amortize this loss through operations.

That doesn't mean I am stating that the Commission would be bound to do that; I am saying that if they approved it and authorized it, the company would by that means, as I see it, be permitted to charge that loss to operating expenses.

Q. In any pipe that is consumed in service, such as I understand is so in the Arkansas Valley, which represents a loss that was unpredictable because the pipe is pitted and can't be used, long before the end of the service life, would the loss between the original cost and the percentage that has been accrued against that as depreciation less salvage properly be handled in that way so that it might be charged through operating expenses, the service life that would be consumed in service?

A. I don't think I can answer that question without—I doubt if it could even if all of the facts were known, because I believe a situation like that would require engineering judgment in addition to the accounting information and I believe in the final analysis that is one of the things that is determined by the Commission rather than by the opinion of any member on its staff.

Q. It is probably more of a proper charge to the reserve on the theory you have that the service life will eventually run long enough to average them all up?

A. I don't think an accountant would be proper in getting too much concerned about occasional or sporadic situations of that kind. If they have set their service life up at the beginning of a property and if the experience develops the judgment isn't as good as they thought it was going to be; then if the experience of the property is not proving that their estimates are reasonable, the situation you talked about there might call for a revision of service life estimates. I am just suggesting that; I am not making any definite answer to you at all.

Q. I understand that in connection with the necessity of having the exhaustion of the field in a greater number of service lives you did make inquiry of the engineers and satisfied yourself that there was an ample margin?

A. Yes, that is true.

Q. What is the process that you can go through in determining how far beyond 1978 there should be a gas supply for this line so that at its final exhaustion you will have one hundred per cent of the original cost?

A. That is not an exact science—

Q. I would agree with you on that.

A. —because there is too much unknown. There are too many factors unknown. I believe the correlating of those factors, that is, a final decision as to whether or not you might say the margin was sufficient, was a part of the engineering study; I know it has been considered. I think I have fulfilled my duties and responsibilities as an accountant, but we do not know what the future requirements are going to be at this time except as the engineers have made their estimates of it, and wo do not know as to an absolute certainty except as the engineers have estimated it, as I see it, as to what the property addition is going to be from now until 1978 or any other time. Those are both factors that probably enter into that.

Q. It would require a study, no doubt, of the past experience; do you know what retirements have been made in the past of the particular property?

A. The past retirements and prospective retirements. You see the engineers examined this property and inspected it and of course I had no part in that.

Q. You did see to it or were satisfied in your own mind that they would be given consideration to the period beyond the end of the 50-years service life for which gas would still be available through this line?

A. That is my understanding.

(Vol. L, pp. 6864-6884.)

* * * * *

Q. Mr. Smith, will you turn to Page 17, Exhibit 174, which deals with compressing system?

A. Yes.

Q. Will you point out to me the column in which compressors themselves are contained?

A. That is Column 6 as I understand it.

Q. According to the note that is 2.78 per cent; that would be roughly about a 35-year service life?

A. Yes, approximately.

Q. That service life, I take it, is one based entirely upon the physical life of the unit?

A. I believe when the engineers take the stand they can give you a little bit better detail on that than I can. I am not sure but what that is a composite rate than can be

broken down a little further than that. That is my recollection of it now.

Q. Do you know whether in arriving at that service life there was any consideration given to the possible obsolescence or change in the art in any of those functional factors?

A. I understand the functional factors have been considered all the way through.

Q. If you have your mimeographed statement that you read into the record, please turn to it. I notice on the bottom of Page 2 it is stated: "The Company's reserve for depreciation and depreciation expense accounts are incorrect and require adjustments for several reasons: (a) the annual depreciation rates used by the company have varied."

Of course, you are making this conclusion after having had all of the facts before you and as you say using hindsight to the extent that it was available?

A. Yes, in arriving at these determinations, both the engineers and accountants' determinations, it seems to me that we are predicating our present findings to a great extent upon the company's experience to date. Of course, that couldn't be the sole factor but it has been an influential factor.

Q. Now these various rates that this company used, I think they are shown in your exhibit. I guess that is at Page 6, Exhibit 174, isn't it?

A. Page 6 attached to Journal Entry 403 shows the company's rates and their accruals.

Q. And that discloses that at the beginning the company used five per cent as the annual rate of accrual for depreciation on their main pipe line system?

A. Yes, they used five per cent, in fact, on almost every class of property with a few exceptions.

Q. Now, the accounting officers or other officials of the company who were responsible for that determination back in 1928 did not have available to them the information that you had when you made this exhibit?

A. No, they certainly didn't have twelve years of the company's experience available.

Q. And I assume that the way an accounting officer

would proceed in the beginning would be to assemble all of the information he could, which of course wouldn't be very much, and then make a determination of a percentage rate, isn't that correct?

A. I think that the actual determination of a percentage rate, should probably be left up to an engineer, if he had one.

Q. Then somebody in the company would have to furnish the facts and make the decision?

A. That would be true. I think that sometimes the accounting officer of a company in any particular situation might be influenced on his depreciation a great deal by income tax considerations.

Q. Well, your statements that the accruals in that year of five per cent were incorrect and was based, as I take it, upon a consideration of the facts available to you after twelve years' experience and not because you believed that the decision made in 1928 on the facts then at hand was an incorrect decision?

A. I don't mean to reflect upon the judgment of the accounting officer at that time. I merely mean to point out that experience has shown a better determination can be made now.

Q. Then you don't mean to imply that the fact that a company may have over a period of a number of years used different rates of depreciation that there was anything wrong or incorrect about it merely because there were different rates?

A. Well, regardless of how good the intentions of the accountant were and how good his judgment may have been in the light of those conditions, if present conditions and the experience of the company shows that his estimates were incorrect or unreasonable, the fact remains that they were incorrect and unreasonable.

Q. That is, what you are speaking of here is that it now turns out on the basis of experience and present knowledge that those previous rates were incorrect?

A. Yes, it seems to me that that is the only interpretation you could make.

Q. That could be true with your present rate as well. Suppose ten or fifteen years from now new facts developed that indicated that the rates you set up were not correct at that time. We could again make the statement that the depreciation rates were wrong because they had varied?

A. You mean the rates I have used instead of your rates?

Q. The rates you have used, yes.

A. Oh, I think that follows. Depreciation is an estimate and we all recognize that the service life is an estimate, and if it is good accounting to make a restatement of depreciation today, twelve or fifteen years after the company was formed, it follows that it might be good accounting practice to make one thirteen years in the future, but not having the facts, I don't know.

Q. The thing I had in mind was this; that the determination of the annual rates can be made only in light of presen. known knowledge and that if subsequent developments show a different set of facts, then the appropriate thing to do is to find out what those facts justify and then change your depreciation accordingly?

A. That is probably true. That is one of those bridges you cross when you come to it.

Q. In the language you used where you speak of the fact that annual depreciation rates vary, you are not indicating that wherever conditions have required a change in rates from time to time there is anything more than just a mistake of judgment and maybe not, on the basis of then known facts?

A. I think that is the implication of Section (a). Section (a), which points out the flaws, we might say, is not nearly so significant as Section (c).

Q. Let's take Section (b). You say: "Accrued depreciation has been restated by the company by entries made directly to surplus."

Whenever a new set of facts appear that indicates there should be some restatement of depreciation, is there any other way that it can be handled than through adjustment to surplus?

A. You mean so far as recording the transactions on the books at the particular time?

Q. Right.

A. That is a matter of bookkeeping procedure and is probably entirely correct; as a matter of financial reporting, the company, of course, is obligated I think to go further than to merely make the restatement on its books and charge it directly to surplus. When it puts out reports or if it made a statement of income, comparative

statements by years, whether it was three, five, or ten years, I think that the surplus adjustments of that nature which have their inception only because they are a restatement of income for prior years, should be reflected in any restatement of income for a series of prior years.

Q. That is, you would want to put back in the year in which it should have taken place the accrual of depreciation that was not actually put on the books until the subsequent year?

A. Yes. Any accrual or any revision should be related back to the proper year.

Q. But as far as the books are concerned, it is not your intention that they should be rewritten every time you make some revision of your depreciation situation?

A. No. I feel as though any major revisions or restatements of depreciation should be reflected directly to the surplus account on the books. Now, if it was just a minor restatement or revision it might be absorbed in an income account of a particular year.

Q. So you don't mean to imply that the company's books were incorrectly kept by reason of the matter that you state here in Paragraph (b)? The reason I mention that is because the beginning of that sentence reads: "Reserves for depreciation and depletion expense accounts are incorrect,"

A. Yes.

Q. I say again, the implication is that they are incorrect because they don't reflect exactly the facts as later developed with respect to depreciation?

A. That is the income account of a particular year; picking it out may not reflect the correct fact to the depreciation expense for that year?

Q. Yes, but the bookkeeping the company did in handling it that way, as far as the books were concerned, was a correct way in doing it?

A. I think as a matter of bookkeeping procedure they follow what any bookkeeper would normally do.

(Vol. pp. 6885-6892.)

* * * * *

Q. Well, now, let me ask you to apply the principles you have just stated to this rate case. Let's assume that the Commission finds that your proposed annual rates of accrual

are correct and bases its rates on them and suppose ten years from now on a reappraisal of the situation in another rate case which it brings because they don't think our rates are high enough, it then appears without question, without dispute, that despite your best efforts today, that it then turns out that your rates were too low.

Now, if we go back and restate our books and show that we depreciated too little, how are we going to get that from the rate payers?

A. Well, that is a problem of rate study. I think that is entirely out of my field.

Q. All right, now, of course let's assume that we can't do it. That seems to be an axiom.

A. You couldn't—

Q. That you cannot collect it from the rate payers over the past ten years. I think that is a normal assumption.

A. You mean ten years in the future, from now?

Q. No, I mean we couldn't go back to the past ten years when the depreciation should have been higher and get a higher rate from our customers because of that additional expense item.

A. Yes, but this future period you are talking about is ten years from now. It isn't—

Q. Oh, no, ten years from now is when we find that you are too low, see.

A. I wanted to get the periods straight.

Q. Yes. Now, when we find you are too low, if we go back and restate our books it will show a lesser net utility income than it had shown, yet the company would not be able to collect any greater gross revenue because of that, and, therefore, isn't it so that in a case where a company is subject to public regulations that you have got to apply a little different rule to that situation than you do to the ordinary business concern that does not have its prices subject to regulation?

A. Well, your question, though, goes right to the matter of setting rates. It doesn't go to the matter of accounting.

Q. Well, we have to keep our books, of course, under the jurisdiction of the same authority that fixes the rates, and I assume that there ought to be some conformity between what is done in one function of the Commission and what is done in another.

A. Well, of course, I presume that the Commission would deal with that situation in a manner that it thought was proper and legal, but that couldn't possibly change my finding as an accountant today, as I see it.

Q. Not today, but it changes it ten years from now; then we would have to go all the way back—

A. All the accountants—if that situation did materialize—all the accountants could do would be to reflect the proper entries in the accounts at that time.

Q. But what I am trying to get at, do you think that under those circumstances we ought to go back to the beginning and restate on our books the depreciation and reserves and the annual accruals?

A. You mean to restate your annual accruals—

Q. Yes.

A. —year by year—

Q. Yes.

A. —open up your books—

Q. Yes.

A. —or rewrite your books, or something like that?

Q. Yes.

A. I think as a matter of bookkeeping procedure it would be adequate to make that adjustment through surplus, if you were required to do it and if it were approved by the Commission, and I am speaking now not from the standpoint of making a ruling that the Division of Accounts is going to be bound by. I am just speaking from the standpoint of an accountant.

Q. The result would be, would it not, that since we have not collected a sufficient depreciation in the past that your plan would be, or your method would be that we would not be permitted in the future to boost the then correct rate up a little to take care of the past deficiencies; that we would go right ahead if it then developed instead of a 50-year life it was 33-year life; we would go right ahead on three per cent from then on without attempting to average the thing off so that the company should recover what it should have recovered?

A. Well, I am making no findings here or making no statements whatsoever about rate setting. The central theme of my business as an accountant is to determine income and I have laid down the principles that I think are absolutely

correct from an accounting standpoint and I believe are concurred in by more than a substantial majority of qualified accountants. The matter of determining what is the cost of gas operations is one thing. The setting of rates is something else.

Q. And so that is clearly understood, that you have not considered the effect on rates in making this depreciation study, that you haven't given that consideration?

A. I—oh—well—

Q. Well, what I want to get at is this: I want to be in position to say to this Commission whether you have or not, and argue the thing. To me it seems it should be given consideration by somebody. If you haven't, then I want to know that and I can go somewhere else.

A. Well, my study has been confined, speaking broadly of the depreciation study and all of the income account study—it has been confined to setting forth year by year the correct cost as nearly as we could determine it from an accounting point of view, the cost of conducting gas operations.

Now, as to setting a rate based on those facts, I hope that we have done them well enough that they do form an intelligent basis for rate setting. I have every confidence that they do because I think they are good accounting. I don't know an accounting job that I have ever done that I felt as good about when it was over with, that we had gone into everything that should be gone into and had all of the expert assistance to back us up on matters that weren't accounting, and that sort of thing. I feel as though it is about as good a piece of accounting work as it is humanly possible to do but it has been purely an accounting piece of work and it is hoped that it furnishes the basis for intelligent rate study, but the rate study is somebody else's responsibility.

Q. In consideration of such questions that I made, it would be something that you would defer to the Commission, that is, pass over to them; that is, let them answer?

A. I believe that that is correct.

Q. Mr. Smith, in arriving at these annual rates, I think you said that you got the service lives from the engineers after realizing that they had given consideration to the estimated life of the field. Now, in making your estimates of the annual rates I take it, then, you gave no consideration

to the fact that the contract between Canadian River Gas Company and Colorado Interstate Gas Company runs for twenty years. You didn't take that 20-year factor into consideration?

A. The existence of that contract, of course, was known. You are speaking now of the contract for sale of gas by Colorado Interstate to Public Service?

Q. We can include that, too, yes. I first mentioned the contract for the purchase of gas by Colorado Interstate from Canadian River, but it has an initial period of twenty years and that would apply both to the pipe line factors of Canadian River as well as the pipe line of Colorado Interstate.

A. Well, I think I can sum it up this way: I believe that the assumption has been made by the engineers that this project—meaning the Canadian River and Colorado Interstate—both as one project; has been treated as an enterprise which would continue to operate so long as a supply of gas is available.

Q. Without regard to any contracts with its customers that have expiration dates in them before that time, such as the Public Service Company contract which ends in 1948?

A. That is correct. I don't know of any precedent in accounting practice where the—going back to a manufacturing concern—the fact that it may have contracts or commitments only for twelve months in advance, that does not modify our accounting. We try to find out the cost of doing business for that 12-months period and we have to assume that it is a going, continuing enterprise because in any other determination it seems to me it would be more legal than in the accounting field.

Q. You considered it was a going enterprise until the field became exhausted?

A. So long as the supply of gas is available.

Q. You are not limiting that to the immediate property of the Canadian River?

A. I am not prepared to answer that completely. Now, I think that will show up clearly in our engineering testimony as to exactly what they have done on that.

Q. At any rate, you have limited it solely to that particular set of circumstances you say, namely, that Colorado Interstate will be a going concern in business so long as the gas supply is available, which number of years or availability will be covered by later witnesses?

A. That is my understanding that it will be supported.

Q. Did you make any examination or study of the papers and other documents that were filed with the Internal Revenue Bureau and used by it in connection with the revision of rates that was made in 1936 or 1938, but which resulted in the revision of the then currently charged annual rate for depreciation?

A. I didn't make a detailed examination of those papers or documents.

Q. Did you give any consideration in arriving at your annual accrual rate to the decision of the Internal Revenue Bureau, then, with respect to the life of Canadian River's gas supply which as I recall it is twenty-five years from 1931 which the Internal Revenue Bureau accepted?

A. The only consideration to it that I have given in this study would be what you might call an indirect one, as that being a factor that affects my computation, and I say "indirect" in the sense that whatever consideration I reflected here is the consideration that has been given it by the engineering staff in arriving at their judgment.

Q. You were cognizant of that life of the field that was stated in the Internal Revenue papers, were you?

A. It has been my general understanding that the assumption was followed out by the company in its accounting that the supply of gas might be exhausted in about 1956 and that was in conformity with something that the Bureau of Internal Revenue—finding it had made, but that was only general information—general knowledge. I am not familiar with the documents. I don't know anything about them and the responsibility of giving that the proper weight is not a part of my study.

Q. And you did not attempt to give it any weight in considering that along with the service lives that the engineers gave them?

A. I did not see any way that I could give it any weight without just arbitrarily refusing to accept the findings of our engineers.

Q. I was only *interest* in the facts. I am not trying to criticise you for it. As a matter of fact, however, you did not give any consideration to it in weighting it in with the opinion which the engineers gave you?

A. No, I did not weight that along with the engineers'

estimates. I accepted the engineers' estimates of service lives which they have determined.

Q. So that any consideration that was given to that would have been given by the engineers?

A. That is my understanding.

Q. Would you turn to Exhibit 176 which is the Canadian River Exhibit, and it might be appropriate at this time to ask you, Mr. Smith, whether or not the questions and answers which you and I have been engaging in would have application to the Canadian River—at least that part of it that is the transmission line from Bivins north, or do you wish to wait until you have read the record and answer the question? Would that be preferable to you, to read the record today?

A. Well, I think I can say at this time that any statement I have made relative to the general theory of depreciation accounting and as to the dovetailing of my exhibit here with the work of our Bureau of Engineers would apply equally to the transmission facilities of Canadian River and Colorado Interstate Gas Company.

By Mr. Spencer:

Q. Well, would that also be true in speaking of the general principles you have discussed with respect to your work in regard to production and gathering facilities of Canadian River Gas Company included in your Exhibit No. 176, confining ourselves only to general principles of accounting and general treatment here?

A. You mean confining it to the depreciation study rather than what we have determined in our depletion study.

Q. Yes, eliminating the depletion study.

A. I believe that is true.

By Mr. Dougherty:

Q. Now, Mr. Smith, if you will turn to Page 20 of Exhibit 176, under the heading of "Field Lines" which is Column 6, I note you have an annual rate of two and a half per cent during the period through 1939 which you have accrued to $287,158.56 and the original cost of retirements without giving any consideration to salvage of $191,095.58. Now, that indicates, does it not, that a good deal of rearranging of field lines has taken place in the Canadian River gathering

system if out of a total of roughly $287,000 you have retired $191,000.

A. Well, of course, your retirements—I think that a better comparison is on Lines 3 and 4.

Q. There you have got in Line 4 more retirements than the original cost even.

A. The comparison of Lines 3 and 4.

Q. Oh, you mean up above it. I thought you meant Columns 3 and 4.

A. No.

Q. That is the same figure?

A. It is true that original cost of $191,095.58 has been retired throughout the company's existence in comparison with total original cost charges as shown on Line 3, of $1,442,269.53.

Q. That's right, but I am talking about the annual rate of depreciation now. They have got a lot more lines there, but you have accrued on the basis of two and a half per cent a year, not a great deal more than the gross retirements. Do you know whether those retirements were made by reason of termination of lines or for relocation and resetting?

A. To make it certain as to that I would probably have to refer to the working papers, but I can point this out and it may serve to answer your question. The high salvage on that, shown on Line 20—

Q. Yes.

A. —would indicate that probably considerable relocation took place there rather than complete retirement out of operation forever, so to speak.

Q. That probably went through the warehouse and then out of second-hand pipe into the new location or something of that sort?

A. That is my recollection, now, of the accounting practice on those things.

Q. Now, where you have a situation such as that is in gathering lines, of course, the intangible costs, the labor, and so on, and the cost of putting the line down, that is all gone isn't it when you make a relocation?

A. The only salvage would be on materials.

Q. So that there is a complete loss of construction costs?

A. Of course, you have got other factors to consider there. It depends upon what they do with their reinstallation costs.

Q. Well, you have got to spend more money to move the line.

A. Well, whether it is charged against the reserve has to be considered.

Q. It is appropriate accounting practice, isn't it, that those construction costs are capitalized and upon retirement should be charged against reserve, shouldn't they?

A. I believe that that is an acceptable accounting practice to capitalize the original installation costs and then to retire those costs against the reserve.

Q. Well, isn't that the way they will have to be accounted for under the Federal Power Commission Code?

A. That is my understanding. I believe that is right.

Q. So not only is it acceptable but there it is. That's the rule as far as natural gas companies are concerned.

A. Under the code.

Q. Under the code?

A. Yes.

Q. You don't have that same factor where a lateral line is concerned that runs to a customer, say, for Colorado Interstate? You have reflected those in that exhibit which, as I recall, shows two and a half per cent annual rate for a number of those lateral lines. Is that your recollection?

A. I recall that that rate was used.

Q. Now, having in mind the different factors involved in field lines, mainly that of frequent relocation and the loss of all construction charges, shouldn't there be a greater annual rate per annum for field lines than for a lateral line or a main line?

A. Of course, I think that that would be leading to an engineering conclusion it seems to me. In studying these service life estimates, I believe that the engineering testimony will support exactly what they had in mind by that service life estimate.

Q. However, from the books and from an accounting standpoint, it is quite apparent that there is a problem of loss of construction costs in field lines which is not involved in lateral lines, is that not correct?

A. It seems to me, now that I have thought it over again, that what the code says is that—there is a provision in there that would permit any relocation to be charged to expense.

(Vol. L, pp. 6898-6912.)

* * * * *

Q. Mr. Smith, this morning in connection with your cross examination on Exhibit 174, Colorado Interstate Gas Company, some reference was made by you concerning a figure that you understood the Internal Revenue Bureau had used as to the life of the field or the reserves of Canadian River Gas Company and what is your information about that? What support, if any, did you have for it?

A. Well, the information that I had was just general knowledge, the general understanding of the situation that was disclosed in the accounting examination. I did not see any documents to support that theory and I got the information that the company—

Mr. Spencer: Now, wait a minute, Mr. Smith. If he knows—any figures he knows, he can put in, but if he is going to put geological figures in here that he knows something about—

Mr. Lange: That is the very thing I want to ask him, whether that was based on any kind of an estimate or whether it was an agreed figure or whether he knows any of the facts about it at all.

The Witness: No, I really don't know what the understanding was, if any, between the Bureau and the company and I don't know any documents on which it was based. So far as I am concerned, it is hearsay that I gained from talking to our Examiners who had been down there and who had questioned—it was a natural question to want to know what the company had based its depreciation accounting policy on and that was the understanding that I gained, that it has to do with income tax purposes, and I don't know what, if anything, there was to back that up on the part of the company.

(Vol. L, pp. 6935-6936.)

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S RECLASSIFYING AND ADJUSTING ENTRIES
RELATING TO ANNUAL AND ACCRUED DEPRECIATION

Particulars	Debit	Credit
No. 402		
Surplus - Miscellaneous other income - 1933	$3,532.73	
Reserve for depreciation (salvage) - 1933	6,700.63	
Reserve for depreciation (cost) - 1933		$10,233.36

To correct the Respondent's accounting in the depreciation reserve for the retirement of the Clayton lateral line, measuring station and equipment, sold to Canadian River Gas Company as of June 1, 1933. The following tabulation shows a comparison of the Respondent's accounting per books for the transaction and the basis as adjusted by Commission accountants:

Account	Per Books	As Adjusted	Difference
Plant accounts at May 31, 1933:			
Transmission line and right of way	$40,039.50	$29,826.34	$10,213.16
Measuring system land	100.00	100.00	
Measuring system structures	342.28	345.47	(3.19)
Measuring system equipment	1,265.10	1,241.71	23.39
Total plant accounts	$41,746.88	$31,513.52	$10,233.36
Reserve for depreciation at May 31, 1933:			
Transmission line and right of way	$ 6,312.39	$ 2,873.00	$ 3,439.39
Measuring system structures	114.33	42.74	71.59
Measuring system equipment	226.89	205.14	21.75
Total reserve	$ 6,653.61	$ 3,120.88	$ 3,532.73
Net investment, representing sales price:			
Transmission line and right of way	$33,727.11	$26,953.34	$ 6,773.77
Measuring system land	100.00	100.00	
Measuring system structures	227.95	302.73	(74.78)
Measuring system equipment	1,038.21	1,036.57	1.64
Total sales price	$35,093.27	$28,392.64	$ 6,700.63

The plant investment of Colorado Interstate Gas Company in the Clayton properties sold was adjusted in Examiner's entry No. 209 which is included in the exhibit entitled "Gas Plant Accounts and Examiner's Adjustments." Entry No. 209 resulted in a credit of $10,223.36 to miscellaneous other income for 1933 representing the excess of the plant account per books for the properties sold as of May 31, 1933 over the adjusted cost thereof. This entry (No. 402) reduces the profit on the sale by $3,532.73 representing the excess of accrued depreciation on the properties sold per books over accrued depreciation thereon as adjusted and also corrects the entries to the depreciation reserve for salvage and cost retired, respectively.

		$5,132,041.60

To reverse the Respondent's annual provisions for depreciation and to clear the reserve for depreciation of the debit of $1.76 in 1930 which was credited to work order No. 47. See details attached for summary of Respondent's annual provisions for depreciation by accounts, and a reconciliation of the annual provisions per books and as reclassified after giving effect to reclassifying entries made by Commission accountants.

Notes:

(1) The change in depreciation rates as of July 1, 1931 was made retroactive to October 1, 1928, and the depreciation reserve per books restated accordingly by a direct surplus entry. The change as of May 1, 1936, affecting transmission line rights of way, was made retroactive to January 1, 1935, and the reserve for depreciation adjusted through surplus accordingly. The changes in rates during 1938 were effective from January 1, 1938. The change in the method of computing the depreciation on garage equipment in the year 1939 was made retroactive to 1928, and the depreciation reserve adjusted accordingly. The change in rate applicable to transmission rights of way during 1939 was effective January 1, 1939.

(2) Depreciation was provided by the Respondent on autos and trucks only until cost was entirely depreciated.

(3) Examiner's entry No. R-135 included in the exhibit relating to the income account, reclassifies surplus adjustments involving depreciation to income account of year affected.

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S RECLASSIFYING AND ADJUSTING ENTRIES
RELATING TO ANNUAL AND ACCRUED DEPRECIATION

No. 404 (Cont'd)

Notes:

(1) The amortization rates used by the Respondent have been designed to write off the recorded costs of, or the values placed upon, the contracts over their respective lives. The contracts for the purchase and sale of gas are being amortized on the books over the 20-year period from July 1, 1926 to June 30, 1948, the expiration date of the contracts. The recorded cost of the City of Colorado Springs, Colorado, contract is being amortized on the books from July 1, 1931 to June 19, 1948.

(2) Amortization for the six months ended December 31, 1928 and for the year 1929 was charged to surplus on the Respondent's books in the years 1931 and 1930, respectively. These charges were transferred to the income accounts of the years to which applicable on Examiner's entry No. R-137, which is included in the exhibit relating to the income account.

" 1938	(3,447.37)
" 1939	15,537.34
	$31,729.53

To charge reserve for depreciation with net amount of profit and loss on retirements which have been shown in the reclassified income statements as charges or credits to income. (Entries Nos. R-136 and R-138 in the exhibit relating to the income account result in showing all profits and losses on retirements as a separate caption in the income statements, as reclassified.) The charge to the reserve of $5,367.96 for cost retired represents various items of property charged off to expense and to surplus in 1931, and reclassified by the Examiner to profit and loss on retirements. See details attached for reconciliation of profit and loss on retirements reflected in the reserve for depreciation per books with the amounts used in this entry.

Reserve for depreciation of gas plant in service			$2,819,797.11
Reserve for depreciation of gas plant held for future use			3,663.18

To record the annual depreciation of gas plant in service, based on service lives estimated by Bureau of Engineering. The gas plant held for future use is segregated by Examiner's entry No. 214, as of December 31, 1937. Depreciation computed on this property to December 31, 1937 is charged to depreciation expense. See Schedule No. 1 for details of adjusted annual depreciation.

No. 407

Reserve for depreciation of gas plant held for future use - 1937	$1,319.04	
Reserve for depreciation of gas plant in service - 1937		$1,319.04

To transfer to the former account the net charge resulting from retirements of gas plant held for future use, as per details in following tabulation:

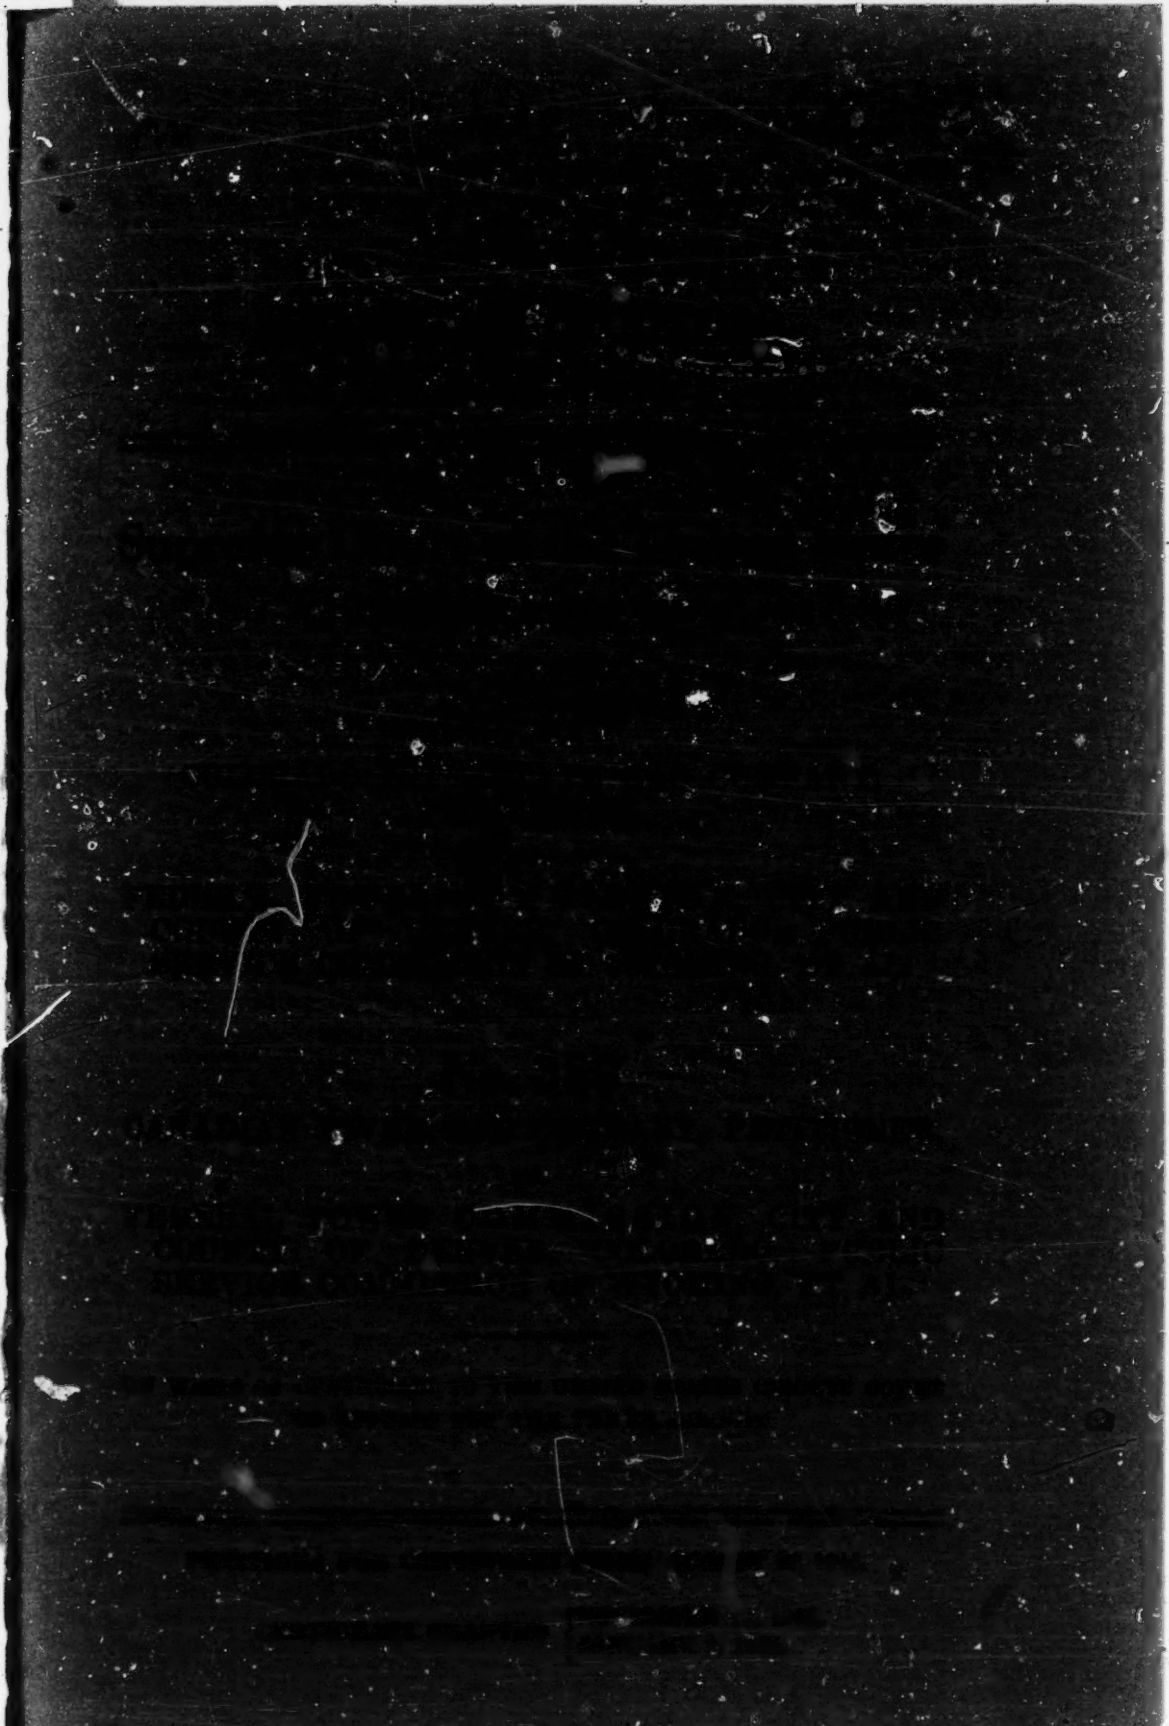
1819



United States Circuit Court of Appeals

TENTH CIRCUIT.

No. 2550.

COLORADO INTERSTATE GAS COMPANY, a corporation, PETITIONER,

vs.

FEDERAL POWER COMMISSION; CITY AND COUNTY OF DENVER, COLORADO; PUBLIC SERVICE COMMISSION OF WYOMING; COLORADO-WYOMING GAS COMPANY; and CANADIAN RIVER GAS COMPANY, RESPONDENTS.

No. 2551.

CANADIAN RIVER GAS COMPANY, a corporation, PETITIONER,

vs.

FEDERAL POWER COMMISSION; CITY AND COUNTY OF DENVER, COLORADO; PUBLIC SERVICE COMMISSION OF WYOMING; COLORADO-WYOMING GAS COMPANY; PUBLIC SERVICE COMPANY OF COLORADO; and COLORADO INTERSTATE GAS COMPANY, RESPONDENTS.

ON PETITION TO REVIEW AND SET ASIDE ORDERS OF THE FEDERAL POWER COMMISSION.

FILED SEPTEMBER 9, 1942.

VOLUME 4—Pages 1821-2400

Further Testimony of the Company's WITNESS, LUSK.

Q. Mr. Lusk, have you prepared a statement at my request relating to Colorado Interstate Gas Company entitled "Past and Future Net Operating Earnings from Denver Line Sales of All Gas Applicable to Depreciation, Amortization and Return, 1928 to 1947, inclusive"?

A. Yes, sir.

(Vol XLVIII, p. 6598.)

* * * * *

Q. Now, turning back to your Statement 1 of the exhibit, the figures under Column 4, where do you get them? How do you arive at those figures?

A. The difference between Column 2 and Column 3—in other words, it is Column 3 subtracted from Column 2.

Q. That give you the total net earnings?

A. That is correct.

Q. You projected those beyond 1940, didn't you?

A. They are projected—

Q. They are just mere calculations?

A. Yes, sir.

Q. Now, this total net earning figure, when you get to that point on Statement 1—strike that.

In what manner do you treat depreciation? Isn't that a cost of operation?

A. Not for this purpose.

Q. What purpose do you mean?

A. For this purpose here I am trying to find the amount which is available for depreciation and amortization.

Q. You don't consider depreciation as an operating expense?

A. No sir.

Q. And you can leave it out of the computation of your net earnings?

A. Well, the computation of the net earnings doesn't include the depreciation. If I put the computed depreciation amount that is arrived at here back in a deduction in the net earnings column I would still come out in Column 5, that is, at the eight per cent return.

Q. But you left out the consideration of depreciation in

the computation of your net earnings in Column 4, Statement 1?

A. That is correct, I have.

Q. Have you taken into consideration in doing that what the Uniform System of Accounts provides for with reference to depreciation?

A. I haven't considered the Uniform System of Accounts in any portion of this exhibit?

Q. At all?

A. At all.

Q. So you arrived at your net earnings and then only in Column 6 as a matter of pure calculation where you set up the amounts that you say will at that point be available for depreciation and amortization?

A. That is correct.

Q. How did you say you arrived at the amounts under Column 6, Statement 1, Exhibit 170?

A. It is the difference between Columns 4 and 5. It is Column 5 subtracted from Column 4.

Q. Now, then, you didn't give any consideration to depreciation in this Column 4 of Statement 1. With reference to your Column 1 where you use original cost, did you apply against that the accrued depreciation as per company books?

A. No, these are undepreciated original cost rate base at January 1 each year, undepreciated.

Q. What is the accrued depreciation of the company's books? Do you have that available for each of those years?

A. I can tell you what was there as of December 31st, 1939, but I don't have it for each year. The accrued reserve then was $4,494,325.

Q. Does that include the amortization reserve also in the contract?

A. No, sir, that is only on property.

Q. What is that amortization reserve on contract per books?

A. I believe that question came up once before during the testimony on the exhibit that covered the amortization of the contracts and franchises—covered the cost of the contracts and franchises. I think it was acceptable to either you or Mr. March that I read the amortized cost into the record instead of looking for the amount as amortized each

year. That figure less the amortization reserve in 1939 was $1,180,616.69.

Mr. Dougherty: If you wanted to get the reserve, Mr. Lusk, you would deduct that from $2,589,608, which is the cost of gas contracts as shown on Statement 2 of this exhibit?

The Witness: That is correct. The company is amortizing it on a uniform basis at approximately $153,000 a year.

By Mr. Lange:

Q. What is the purpose of setting up this depreciation reserve on its books? The figures, for instance, that you gave for the year 1939, what is the purpose of the company setting it up on its books?

A. They are setting up an accrual for reserve for depreciation.

Q. For what purpose?

A. For the retirement of property when the time for replacing retired property rolls around. Then they will have a sufficient reserve to take care of it.

Q. They have been accruing that since 1928?

A. Yes.

Q. In your Table 6, Statement 1 of the exhibit where you say "net operating earnings for return, depreciation and amortization, available for depreciation and amortization," have you since these figures have been computed—I mean since they have been determined in Column 6—made a study of what the company claims is necessary for proper depreciation reserve and amortization requirements?

A. Have I made a study of it?

Q. Yes.

A. No sir.

Mr. Dougherty: You mean actually what has been accrued on the books through 1939?

Mr. Lange: Yes.

The Witness: I have given you that figure.

Mr. Lange: I mean beyond 1939, from 1940 on.

The Witness: Is that in the form of a question? Did I make any study?

By Mr. Lange:

Q. Did you make any study as to what the company's requirements will be for depreciation and proper amortization from 1940 on through 1947?

A. No, sir.

Q. You have not?

A. I did not.

Q. Well, in connection with the studies on income tax paid you have made some assumptions on that, haven't you?

A. Oh, yes, I have made some assumptions but that is purely an arithmetical calculation or computation. That doesn't involve any study as to what the requirements will be.

Q. In what paragraph did you arrive at that arithmetical computation?

A. It works out exactly at the same rate the company is using for depreciation reserve purposes on all of its property with the exception of automobiles, tools, implements, and office furniture, and it is exactly 3½ per cent per annum.

Q. Is that the rate the company has employed heretofore?

A. Yes, sir, beginning with about 1931.

Q. What determined the rate to be applied at that time?

A. The Bureau of Internal Revenue wouldn't accept the company's rate.

Q. What was the company's rate prior to that time?

A. About 4½ percent.

Q. About 4½ per cent?

A. Yes.

Q. Since 1931 the company has employed a 3½ per cent rate?

A. That is correct.

Q. And going back to Statement 1 of your exhibit, Column 5, I see you have "Amount Required for 8 per cent return." How did you arrive at that 8 per cent?

A. The eight per cent was the percentage given by Mr. Coffman; by the four rate of return witnesses; that is, Coffman, Bosworth, Sands and Gilman.

Q. Are you sure Mr. Coffman estimated any percentage in his rate of return?

A. It is my recollection he said not less than eight per cent.

Q. Anyway, you didn't arrive at that eight per cent on your own estimate but you took their estimated figures?

A. That is quite right.

Q. And as I see from this Statement 1 of the exhibit all of these computations throughout the exhibit end with the year 1940, do they not?

A. 1947.

Q. 1947?

A. Yes.

Q. They are projected beyond 1939 and through 1947?

A. Yes, sir.

Q. And why have you projected them on through 1947? Is it the same reason you have heretofore given?

A. It is the same reason I have heretofore given, and in 1947 it is the last full year.

Q. In fact, the contract of January 3, 1928, as you stated, expires in June 1948?

A. June 1, 1948 the contract between Canadian River Gas Company and Colorado Interstate Gas Company expires.

Q. And you pursued that method of stopping at 1947 all the way through?

A. Yes, sir.

(Vol. XLVIII, pp. 6632-6639.)

* * * * *

Q. As I understand it, then, you have made no estimate as to what the company's requirements are for depreciation in the future?

A. None whatever, no sir.

(Vol. XLVIII, p. 6654.)

* * * * *

Mr. Dougherty: I did want to ask this, Mr Lusk: Depreciation is not a cash item in expenses?

The Witness: Ordinarily it is not.

Mr. Dougherty: It is purely a bookkeeping entry.

The Witness: It is purely a book method of transferring it from one account into another, setting up expenses and applying a reserve against it.

Mr. Lange: Is that the definition the Uniform System of Accounts give for that?

The Witness: Well, the Uniform System of Accounts allows any utility to charge it up against depreciation expense and set up a corresponding reserve.

Mr. Lange: You haven't attempted to follow the Uniform System of Accounts provision with reference to the setting up of the depreciation reserve?

The Witness: No, sir.

(Vol. XLVIII, p. 6655.)

Further Testimony of the Company's Witness, Roberts.

Q. Mr. Roberts, you were sworn the other day when you testified, I believe?

A. I was.

Q. Have you prepared for the Colorado Interstate Gas Company a statement showing accumulated depreciation and its application to the original cost of the Denver line properties as of December 31, 1938?

A. I have.

(Vol. XCVII, p. 15002.)

* * * * *

Q. But in this particular proceeding here you are taking, or you are estimating the per cent condition and then relating that to what Mr. Lusk has termed the original cost of the property?

A. I am relating it to the same property that we inspected.

Q. The same property that you inspected?

A. Yes.

Q. But you haven't got any reproduction costs new estimate of that property in this proceeding?

A. Not in this proceeding.

Q. So in that respect it differs from the other valuations proceedings in which you have participated?

A. We went about it in exactly the same way as we did for the other exhibits.

Q. Yes, but as I say, in these other valuation matters in which you participated, you usually had a reproduction cost new estimate and then there was a per cent condition arrived at by inspection—by a physical property inspection?

A. Well, it doesn't make any difference whether it is reproduction or actual cost. It might have been reproduced the day before and both be the same thing.

Q. Well, but I want to know whether or not in all of these other assignments in which you participated and that you cite in your qualification statement, you didn't have a reproduction cost new estimate to which you related the per cent condition after you determined that?

A. Which ones? I didn't understand to which ones you are referring.

Q. You named a number of instances where you prepared valuations.

A. I understood you to say that you didn't have reproduction figures on those.

Q. I said, you did in those cases.

A. I misunderstood you. I thought you said you did not.

Q. In all those instances where you stated you had something to do with valuations of property you had a reproduction costs new estimate, didn't you?

A. In most of them, I would say.

Q. In which ones didn't you?

A. I will have to look at this list.

Well, the only one on that list—of course, I have worked on some other companies too—on the Sinclair Consolidated Oil Company at one time I think we did make some estimates of depreciation to be set up on the books. I participated a little bit in that but to such a small extent that it's not worth mentioning; so the rest of these would be on reproduction basis.

Q. Yes, that's what I meant. They were all related—in other words, the per cent condition that you arrived at was related, then, to the reproduction costs new estimate?

A. As I recall it—some of these jobs are quite a long way back and I might be a little bit mixed up on them.

Q. Now going back again to your Exhibit 272, in arriving at this, what you term accumulated depreciation, did you make actual field inspections of what units of property of Canadian River?

A. The men who determined this accumulated depreciation in the field inspected the major buildings, the pipe lines, the measuring station structures on which I had made a list, chronologically and they inspected every fourth one of them in the order in which they were constructed.

Q. Now, this so-called accumulated depreciation, the figure that you give in your Exhibit 272, that is the converted per cent condition as Mr. Rhodes uses it in his reproduction costs new estimate, isn't it? In other words, where you have, say, a 93 per cent condition related to reproduction costs new, you have a 7 per cent accumulated depreciation figure?

A. That's right.

Q. So you do, in fact, have a per cent condition that you are relating to what is termed as original cost adjusted?

A. That's right.

(Vol. XCVII, pp. 15036-15038.)

* * * * *

Q. I want particularly to confine myself at this time to the method that you pursued in relating those inspection figures to your so-called accumulated depreciation.

A. This was done in exactly the same way as it was done on the estimates of reproduction of the Canadian River transmission, and the Colorado transmission—exactly the same as Mr. Rhodes testified.

Q. You followed the same theory that he had with reference to the deceleration of the corrosion that takes place in the field lines?

A. That's correct.

Q. In other words, your inspection made in 1939, related the per cent condition as of December 31, 1938?

A. That is correct. At least, we used it for that.

Q. You used it for that. Well, now, these determinations as to corrosion, as I recall Mr. Rhodes' version of that, you determined that after a certain period of time corrosion would decelerate, is that right?

A. No, not exactly that, not after a certain period of time.

Q. Well, when?

A. As soon as the pit is started it forms a little protection there and the penetration from that time on slows up.

Q. It decelerates, then, as he put it?

A. That's right.

Q. How long will that continue before the deceleration begins; or, once you have a pit, how long will it be before there will be deceleration?

A. As soon as the pit starts, there is sort of a scale

that usually forms over that and there are other factors that enter into it, it decelerates at that time—it doesn't decelerate at that time, from that time on it decelerates.

Q. From what time on?

A. From the time there is some pit starting and some material in that pit.

Q. In other words, prior to that time there is acceleration of the pit, or what takes place?

A. It is not acceleration. When the pipe is put in the ground—

Q. All right.

A. —the depreciation starts—

Q. What do you mean by the depreciation starts?

A. I mean depreciation. The principal thing being pitting, one of the principal things—

Q. When you say "depreciation," you mean the pitting starts?

A. The pitting would start, and when that starts, usually in a pit there is some scale and other matter which tends to decelerate that.

Q. All right, now, at the time you made this inspection of the field lines in 1939, how could you determine how long any of those pits had been—or, how long prior to that time the pits had formed?

A. I didn't need to know.

Q. You didn't need to know that?

A. No.

Q. Why?

A. Because I know from that time on it was going to decelerate and by doubling the age the pit would only go half again as far it had gone.

Q. Yes, but if you didn't know when that pit had actually started on its course on that pipe, how do you know when it will stop?

A. I don't need to know that. I don't need to know when it is going to stop.

Q. Well, then, how can you determine your per cent condition of that pipe, or the depth of the pit, or how far that pit will eventually go?

A. I know because there is a certain depth at that particular time, and we used a formula which is a very conservative formula of doubling the age that the pit would only penetrate fifty per cent further.

Q. Although you don't know how long that pit had been in the actual process of either forming or how long it had been on the pipe at the time you made your inspection?

A. There is a period covered there. It could be from zero to a hundred and it might be from 1 to 50, but the relation between those things is what we got.

Q. You pay no attention or give no consideration whatsoever in making that determination as to that pit inspection as to how long the pit had been on the pipe at the time of the inspection?

A. No, sir.

Q. It is not necessary to do that to arrive at your per cent condition in utilizing your formula?

A. No.

Q. And the time element doesn't enter into that at all?

A. Time is expressed as the speed of the penetration. As I stated, it decelerates. Of course, the deceleration, the time element is considered in that, but that is the extent, the rate is something having to do with time—speed.

Q. Some of these pits you inspected in 1939 were still in the process of decelerating at that time?

A. In 1939?

Q. Yes.

A. Yes.

Q. Well, how much further, then, in the future will that deceleration continue?

A. How much?

Q. Yes, how long?

A. It would continue to decelerate until the time it becomes necessary to remove the pipe, when the pit has gone through the wall, and at such time as it is advisable to remove the pipe. Of course, then the pipe is out.

Q. That is true, but this inspection made in 1939 where you found certain pits that were at that time decelerating, that deceleration would continue for some period in the future?

A. Yes.

Q. Do you know how long?

A. I didn't need to know how long.

Q. You didn't need to know how long?

A. No, all I was interested in was when it would get through the pipe.

Q. You didn't need to know in determining your per

A. No.

Q. And in determining that per cent condition you arrived at it from that particular physical inspection?

A. From the inspections and correlated data.

Q. And you didn't take into consideration the age of the pipe; how long it had been in the ground?

A. No.

Q. You limited your determination of per cent condition to that physical inspection?

A. And other correlated facts.

Q. That is, applying your formula to those readings that were made of the inspection?

A. Yes. Mr. Rhodes and I together made it.

Q. What other correlated factors are you talking about?

A. Well, we considered the cost of reconditioning the pipe.

Q. You mean the cost of reconditioning the pipe?

A. Yes.

Q. How would you arrive at the—or, rather, how would that be a factor in determining present per cent condition?

A. Well, you could either let the pipe depreciate and not try to recondition it before it got to the point where you wanted it removed or you could take the pipe and weld up the pits and put it back in shape again.

Q. Oh, you were taking into consideration what maintenance you would have to apply to that pipe?

A. Not maintenance, reconditioning of it.

Q. What is your distinction between maintenance and reconditioning?

A. I didn't have to make that distinction for this exhibit here.

Q. You are stating, though, some other correlated factors that you took into consideration besides this physical inspection to determine that per cent condition.

A. I said we did make an estimate as to what it would cost to weld up those pits.

Q. Well, how would that assist you in determining the present per cent condition of that pipe? That's something that you are going to do in the future, or the day after you made the inspection. At least not at the time of the inspection.

A. You aren't going to remove your pipe at the time of the inspection, either.

Q. All right, what did the fact that you are either going to repair that pipe or clean it or what-not have to do with determining presently your per cent condition?

A. Well, we wanted to find out how much it would cost to put that pipe back in shape.

Q. For what purpose did you want to find that out?

A. In figuring our estimate of the reconditioning.

Q. You utilize that to determine present per cent condition?

A. We wanted to find out how much it would cost to weld up the pits, where we think it would be necessary to put that pipe in shape.

Q. That was to be done in some time subsequent to your inspection, wasn't it?

A. It might not have been done. It might have been one joint of pipe at that particular time.

Q. At that particular time?

A. It might have been.

Q. When was that ever done?

A. When was that done?

Q. Yes.

A. I don't know if it has been done on this property or not.

Q. So in determining your per cent condition it wasn't essential, or rather, it couldn't have been a part of the factors that went into the figures that finally were put down, could it?

A. Yes, it could. If we found that the cost of reconditioning that pipe was very high, and that method could be disregarded entirely, then the other factors that entered into it would be given more weight than that.

Q. Maybe I can clear it up in this way: What do you define by the term "per cent condition" as you employ it and Mr. Rhodes employed it?

A. The per cent condition as we have employed it, represents the extent to which the property has depreciated as compared with the total depreciation that would cause that property to be retired.

Q. And you relate that to some particular date or time, don't you?

A. No.

Q. It is limited to physical factors, then, isn't it?

A. What do you mean by physical?

Q. Well, something that you can see and determine from looking at the pipe.

A. Well, we studied all factors.

Q. What other factors?

A. Obsolescence, inadequacy, such things as that.

Q. In connection with the determination of that per cent condition?

A. Yes.

Q. Well, didn't you in your Exhibit 273, when you referred to the statement made by Mr. Rhodes in his Exhibit 68, have this to say at Page 1 of the written statement:

"The depreciation accumulated in the property was determined from observations of physical conditions."

Is that the way Mr. Rhodes proceeded and you proceeded?

A. What page was that, you say?

Q. Page 1 of the written statement, Exhibit 273.

A. 273?

Q. Yes.

A. Yes, he didn't mention anything else in the physical—

Q. That was what he predicated his determination of depreciation, or per cent condition on, of those properties, wasn't it?

A. He considered obsolescence, but there is no obsolescence in this property.

Q. There is no obsolescence in this property?

A. No.

Q. So these determinations that he made and that you made were from observations of physical conditions of units of the property as described by Mr. Rhodes?

A. Yes.

Q. Now, then, those readings that were made after the various test holes had been inspected, they were then taken and the formula applied by you?

A. I didn't do it personally. Mr. Smith directed that work and I worked along with him.

Q. Mr. Smith?

A. Yes, sir.

Q. Was it under your direction?

A. Under my direction and Mr. Rhodes'—mostly under Mr. Rhodes' direction in that case.

Q. You then determined from those figures what the per cent condition of that particular unit is?

A. Mr. Smith, Mr. Rhodes and I worked on that. Mr. Rhodes set the final figure on that.

Q. So when you used the term "accumulated depreciation," it is really a conversion of that per cent condition as utilized by Mr. Rhodes in his two exhibits?

A. Yes, sir.

Q. In other words, where you have a 93 per cent condition you say that there is a 7 per cent accumulated depreciation applicable to the particular unit?

A. That is correct.

Q. And it is in that fashion you apply the term "depreciation" in your exhibit?

A. Yes.

Q. Accumulated depreciation?

A. Yes.

Q. In connection with those—there is one other thing I want to get back to. The determinations of per cent condition in any particular unit of property, you didn't determine the life of the particular unit or section of pipe in the ground?

A. Do you mean by "life" how long it had been in there?

Q. Yes.

A. No, I did not.

Q. And in determining the per cent condition of the—strike that.

Going back to your definitions again, you utilized the term "depreciation" as distinguished from "depletion" in your Exhibit 272, didn't you?

A. That is correct.

Q. Exactly what do you have in mind, or how to you define the word "depreciation" as employed by you in this exhibit?

A. Depreciation?

Q. Yes.

A. Depreciation is a figure determined by applying to the original cost the per cent that the property had advanced towards a total depreciation, such depreciation as would cause that property to be retired.

Q. Have you ever had occasion to see for yourself as to the definition of depreciation in the Federal Power Commission's Uniform System of Accounts for natural gas companies?

A. I think I read something that had to do with the way depreciation should be set up on the books.

Q. I mean the definition that is given, the term as it is applied.

A. You mean as applied to the depreciation on the books?

Q. Well, it doesn't limit itself to that particular use.

A. That book is for that purpose, is it not?

Q. I will ask you whether or not this is your understanding of the term "depreciation" as applied to gas plants: "Depreciation as applied to depreciable gas plant means the loss in service value not restored by current maintenance and incurred in connection with the consumption of prospective retirement of gas plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance"?

A. That isn't the way I set this up.

Q. It isn't?

A. No.

Q. In what respect do you define the term differently from that?

A. I have made no allowance for amortization of property in any way for any cause.

Q. What do you have to say with respect to that restrictive clause in this definition, that it does not apply to property that is restored by current maintenance or loss in service value of that property?

A. It is not restored by current maintenance?

Q. Yes.

A. I believe that holds to my definition.

Q. That holds to your definition?

A. Yes.

Q. Well, then, supposing one of these units of pipe, say several hundred feet of it is situated in one of your hot spots you referred to in Exhibit 272, and which unit of pipe has been given a 93 per cent condition or a 7 per cent accumulated depreciation has been applied? Supposing one of those lengths of pipe of several hundred feet is found to be necessary to be removed or retired within a few months after you made that inspection, how would you treat that?

A. How would I treat it?

Q. How would you apply your formula of depreciation?

A. You mean if I were operating a gas company?

Q. Yes.

A. I haven't considered that at all.

Q. You haven't considered that at all?

A. No.

Q. Have you given any consideration in the determination of your per cent condition to actual retirements of units of property out of the production or gathering system of the Canadian River Gas Company during 1939?

A. Where they retired items of property?

Q. Yes.

A. No.

Q. Would it have made any difference in your treatment of accumulated depreciation how soon—strike that.

Even if the unit of property were retired shortly after you had given it a 93 per cent condition, that wouldn't have made any difference in connection with your computation?

A. You mean if it blew up or something like that?

Q. No, if it were retired for any reason at all found necessary.

A. For what reason?

Q. It may have been some of these deep pits that you hadn't discovered in your inspection.

A. Well, our average figure would have discovered enough so that case wouldn't happen.

Q. Oh, it wouldn't have happened?

A. No.

Q. Your method of inspection at those various intervals would have precluded anything happening?

A. It would have precluded 200 feet of pipe being taken up the next day on account of pits going through.

Q. You say you didn't know of any of the retirements that were made by Canadian River Gas Company during the year 1939?

A. Yes.

Q. Well, now, I notice in June 1939—strike that.

When did you complete your inspection of those various units of property? About what month in 1939 was it?

A. Most of it was completed in August.

Q. August?

A. Most of it.

Q. Most of it was completed in August?

A. Yes.

Q. And when did you begin the work that year? Do you know about what month it was?

A. I came out here in March myself and some of the others came out here at various times.

Q. Well, now, I notice in June 1939, under Voucher F-19-25 that 1205 feet 9 inches of 4½-inch pipe of Canadian River was retired. That had been given a 93 per cent condition in your reproduction costs new estimate as of December 31, 1938.

A. Not that particular piece.

Q. Not that particular piece?

A. No.

Q. Why wasn't that particular piece given that per cent condition?

A. It was an average for the whole property.

Q. Then if the day after you gave a particular unit of property a 93 per cent condition, or a month after that unit of property is retired, it wouldn't affect your estimate at all?

A. It is after the date of my estimate.

Q. Supposing it is retired the day after?

A. It still would be after the date of my estimate.

Q. You think you would retire a unit in 93 per cent condition?

A. Do I think I would retire it?

Q. Yes, would you retire it as an operating matter?

A. If a pipe blew up, I would certainly have to replace it with another piece of pipe.

Q. I am not talking about one that blew up but I am talking about one that didn't blow up, one that had a pit you didn't see, or some other condition whereby you found it necessary to retire the unit.

A. There might be an occasion in city work where they might have dumped a lot of salt water outside a soda fountain. If it got down to the joint it would cause the joint to go out faster but it would be some special occasion and it would be such a small percentage that we would ignore it entirely.

Q. That wouldn't be the case of 1205 feet of pipe, would it?

A. I don't know why—it is a very small part of the system, but I don't know what caused it.

Q. That is true, it is a very small part of the system, but it was an instance where a unit of property that had been determined to be in 93 per cent condition was retired, was it not?

A. I didn't say 93 per cent. I said the property in the average would be 93 per cent. There would be part of that found in a lower condition than that.

Q. All right. Supposing, then, there was some portion of your compressing unit that had been given a 93 per cent condition and the very next week that had to be replaced?

A. Well, generally that would be due to an accident.

Q. Due to an accident?

A. Yes.

Q. It couldn't be possible that just from physical observation you weren't able to see some defect there or some part of the machinery that had worn out—

A. It is very remote and it would be an accident in that case.

Q. —or some part of the equipment—

A. It would be defective material—

Q. —that had been worn to the point you didn't see it at the time of the inspection?

A. They go over the engines ever so often and micrometer them and put them in good operating condition, so that is pretty far-fetched to think of.

Q. It couldn't happen?

A. I don't think it could.

Q. In other words, just a physical inspection of a compressor unit can very definitely tell you just how long it is going to stay in there?

A. I didn't say that.

Q. Or a physical inspection of a compressor very definitely determines its per cent condition?

A. If all of the facts are correlated and somebody who is competent to know the operation of engines inspects them, he can tell what the condition is—determine what the condition is.

Q. In applying your method of computing per cent condition, or, as you term it, accumulative depreciation, even if part of that unit goes out right after that determination, that still satisfies that theory as being correct?

A. We have considered all of the parts that wear and if something blew up and destroyed that engine it would have

no effect upon the engine as we had considered it. If there were some minor thing such as a spring or a valve breaking, that is conceivable, but that is such a minute cost as compared to the total cost, that wouldn't enter into the calculation at all.

Q. In other words, you approached this matter of depreciation definitely as an engineering problem? You and Mr. Rhodes both determined the per cent condition or accumulated depreciation from your physical inspections made of the property?

A. That's right.

Q. You contemplated it as an egineering problem?

A. It is primarily an engineering problem.

Q. You approached it in the same fashion as Mr. Rhodes stated he approached it where he states the method he pursued?

A. Yes.

Q. That is where he in turn relates to what he did in the preparation of Exhibit 68?

A. Yes.

Q. You proceeded in the same fashion?

A. That is correct. In fact, Mr. Rhodes proceeded with me, understand that.

Q. Yes, and you proceeded in that fashion in the determination of these percentages of accumulated depreciation in your Exhibit 272?

A. That is correct.

Q. You stated something a while ago with reference to determining at the time you made these inspections whether the pipe could be reconditioned and the pits welded, and so forth, didn't you?

A. Yes, sir, and we supplied the Federal Power Commission engineers with all of that data showing how we made our calculations and it was gone over by Mr. Rhodes. The field lines at the same time were taken off by the Federal Power Commission engineers because they happened to be in the same book.

Q. When you made these inspections and found there should be some work done with reference to either reconditioning the pipe or repairing it, what notation did you make there on your schedule?

A. We didn't make notations as to whether pipe should be repaired, as we recorded the depths of the pits and we just followed that outline Mr. Rhodes presented.

Q. Just exactly as he proceeded in his computation of the per cent condition in those two exhibits?

A. That is correct.

Q. I don't believe you gave any definition of what you understand by the term "depletion" as applied in your exhibit.

A. Well, depletion, when applied against wells, for instance, was based upon the reserves that you had at the time the well was drilled, compared with the reserves at the time you considered it.

Q. What reserves?

A. The recoverable reserves.

Q. Where did you get those figures?

A. I got those figures from an exhibit—

Q. If you know the number of the exhibit, state it.

A. Exhibit 207. That is the exhibit concerning reserves, and the gas withdrawn is covered in Exhibit 206.

Q. Then you applied depletion as you termed it, to the remaining life of the leaseholds? In what way do you relate the depletion to the Canadian River leaseholds?

A. I found out how much gas was withdrawn in a year as compared with the gas at the start of that year and applied that factor against the investment of leaseholds at that particular year.

Q. In that fashion you distinguish your interpretation of the term "depletion" from "depreciation"?

A. You could have depreciated pipe and have put in some new pipe in the place of the line that was there, but when a well goes out you have to drill another well in another location.

Q. Now, then, in determining your so-called cumulated depreciation which you did as of December 31, 1938, from inspections made in 1939, you arrived at what you determined a per cent condition or accumulated depreciation as of December 31, 1938?

A. That is right.

Q. Now, then, with that inspection you made in 1939 which aided you in determining the per cent condition as of December 31, 1938, did it enable you to determine the per cent condition or accumlated depreciation as of January 1 1938?

A. January 1, 1938?

Q. Yes.

A. We could probably make a guess but it wouldn't be very far different from that.

Q. It would be just a pure judgment figure, wouldn't it?

A. To work it backwards, you say?

Q. In your opinion, would a unit of property in 93 per cent condition, December 31, 1938, be in that condition on January 1, 1938?

A. That would depend upon the piece of property and to what use it had been put.

Q. If you had not made any other inspection, how would you arrive at the accumulated depreciation if you wanted to know it as of January 1, 1938?

A. Previous to the date of our's?

Q. Yes.

A. I haven't had occasion to do that.

Q. There would be no way to do that, would there?

A. If your property was in pretty good condition and the operation had been the same and everything had been the same, you could make a pretty good guess at the time.

Q. Of course, if there had been the usual maintenance of the unit—

A. There would be a lot of factors that would have to be considered.

Q. Of course, you would want to know whether the usual maintenance has been applied or had taken place during the year?

A. You would want to know if there was anything unusual.

Q. You would want to know there was good maintenance during that year, wouldn't you?

A. If the buildings were rusting and there was no paint put on them, you would want to know that fact. Are you trying to determine how I got back to an early date?

Q. Yes, I wanted to know if there would be a way of determining that.

A. There would be so many factors you would have to consider, it would become quite an involved problem.

Q. But if the proper maintenance had been kept up during any period earlier, that would have kept up your per cent condition, wouldn't it?

A. You have to have proper maintenance to keep your property up.

Q. To keep it in that higher per cent condition?

A. To keep it in—what higher per cent condition?

Q. Where you had a 93 per cent condition at December 31, 1938 and a high maintenance prior to that time, that 93 per cent you had—

A. You say if I had 93 per cent I would have high maintenance cost or a good policy of maintenance?

Q. If you had known that high maintenance had prevailed for the 12 months earlier than December 31, 1938—

A. What do you mean by high maintenance?

Q. I would say proper maintenance.

A. Proper maintenance?

Q. Yes, a high degree of maintenance.

A. A high degree of maintenance has been exercised prior to that time?

Q. Yes.

A. And then what?

Q. What would you relate then as to the per cent condition for the 12 months prior to December 31, 1938?

A. I haven't gone into that calculation, calculations like that.

Q. You haven't attempted to do that?

A. No, sir.

Q. You haven't attempted to determine what the per cent condition of your unit would be at January 1, 1938?

A. No.

Q. You couldn't do that, could you?

A. Knowing what condition it is in now and knowing what the company's policy has been, I could make a pretty good estimate. I wouldn't be far off.

Q. Why would you be able to make a good estimate?

A. Because this isn't a very fast depreciating property.

Q. You know the company's policy as to maintenance, too, don't you?

A. I know they haven't had to have as much maintenance as some companies.

Q. It has been their policy to keep up maintenance at a proper level, hasn't it?

A. I would say so, as everything was found in good shape.

Q. As an operating problem, that is the most efficient manner to operate the line, isn't it?

A. To keep your maintenance at a proper level, yes.

Q. That would have some bearing on your estimate that

the per cent condition would probably be pretty nearly the year ahead, wouldn't it, being January 1, 1938?

A. A year prior, you mean?

Q. Yes.

A. If you were trying to make an estimate of what it was, then that would be one of the factors you would consider.

Q. You make the further statement in Exhibit 272 in determining this accumulated depreciation, that is, aside from amortization?

A. That is correct.

Q. What do you contemplate the term "amortization" meaning as you applied it here?

A. As I applied it where?

Q. In your exhibit.

A. Well, if you want to amortize the money you have invested in your property over a certain number of years, that would be amortization.

Q. This determination you made in this exhibit is exclusive of whatever amortization may have to be set up?

A. That is correct.

Q. You have made no determination of that amortization?

A. No, sir, I haven't.

Q. What is that intended to provide for?

A. What?

Q. The amortization you have included.

A. I haven't done that.

Q. You haven't?

A. No.

Q. You haven't concerned yourself with that?

A. No.

Q. You have concerned yourself with the time you say the field will be depleted, haven't you?

A. I have, yes, in the depletion of the wells.

Q. You predicate your depletion on the company's estimate as to when the Panhandle field will be depleted?

A. I have based it upon the figures presented by the company witnesses in that respect.

Q. By the company's geologists?

A. Based upon the figures as stated in my exhibit here of original gas reserves estimated recoverable at 50 pounds gauge by Mr. J. D. Thompson in his Exhibit 207 and gas withdrawn through 1927 as shown by Mr. C. J. Peterson

in his Exhibit 206. The figures in those two exhibits are what I used.

Q. Of course if the life of Canadian River acreage is longer than what those engineers estimated, it will have a bearing upon your depletion schedule, won't it?

A. That, and the amount of gas to be taken out, if the rate was changed—

Q. The rate of withdrawal was changed?

A. Yes.

Q. Those factors would have a bearing upon changing your depletion schedule?

A. They would in the future, not up to date. These have already been withdrawn.

Q. In that respect you compute depletion in a fashion entirely different from the way you approached your depreciation problem?

A. Depletion and depreciation here are different things.

Q. You relate your depreciation back to the year 1928 or 1927, don't you?

Mr. Dougherty: You mean depletion.

Mr. Lange: Depletion.

The Witness: Yes. I start with 1928 and I find the amount of depletion arrived at by the method I have outlined for each year and I get the accumulated amount.

By Mr. Lange:

Q. But in determining your accumulated depreciation in the property, you start as of December 31, 1938?

A. No, the property was there in 1928 and I found what condition it was in when I inspected it.

Q. I am referring you now to the determination of the per cent condition. You are relating that to December 31, 1938?

A. Yes, the per cent condition.

Q. In connection with that determination you are proceeding in an entirely different fashion than you proceeded in the determination of your depletion?

A. I have figured depletion and depreciation differently.

Q. In other words, you are proceeding in setting up your accumulated depreciation, as you term it, beginning as of December 31, 1938 against what you say is the original cost of the property?

A. That is the amount accumulated depreciation at that time, regardless of when that piece of property was put in.

Q. At the same time and in the same breath you are determining the original cost of the property?

A. That is right.

Q. And that original cost of property was incurred before December 31, 1938?

A. Yes, but the depreciation I determined was accrued during those years.

Q. During all those years, is that the way you arrived at it?

A. It accrued during that period because when the property was new there was no depreciation, and when we went out and inspected it we found that amount.

Q. During the period from 1928 through 1939 on a unit of property that you say has 93 per cent condition, that is the entire depreciation that accrued over the entire period?

A. That is on the average.

Q. On the average?

A. Yes, on the average for that particular account.

Q. What do you mean by average?

A. Undoubtedly you would find a piece of pipe here and there that had deeper pits than another piece of pipe, and if it had deeper pits that pitting would go through it sooner than it would in the other piece of pipe under the same sort of conditions.

Q. And from a physical inspection you determined the whole accumulated depreciation in that unit as 7 per cent?

A. Yes.

Q. You wouldn't think of attempting to set up or determine depletion of your leaseholds in that fashion, would you?

A. I would say that as the leases depleted you should go out and buy new leases.

Q. I mean you are not even attempting to set up your depletion in this exhibit in that fashion, in the fashion you did your depreciation?

A. No, I figured depletion and depreciation differently.

Q. Do you set up your depletion in your income tax returns for the company on the same basis you set it up in Exhibit 272?

A. I didn't investigate that.

Q. You don't know what the company did in that respect?

A. It seems to me that they based it upon comparable figures, but I couldn't swear as to that.

Q. You are setting up your depreciation here on a sinking fund basis, aren't you?

A. I am not setting it up on a sinking fund basis.

Q. You determined your depreciation in this exhibit as of December 31, 1938?

A. Determined the condition as of that date?

Q. That is right.

A. Yes.

Q. Now, then, if you had another proceeding in 1944, say, or five years after 1938, being in 1943 or 1944, you would go out and make physical inspections of these units of property, wouldn't you?

A. It would depend upon the circumstances.

Q. Well, conceding that your proceeding here is the one you adopted; you would have another similar proceeding five years from now, would you go out and make physical inspections of those units?

A. Making these inspections is an expensive job and I think if competent engineers got together they might be able to determine conditions suitable for rate-making purposes without going to that expense.

Q. How would they do it?

A. They would find out what the conditions were as of the date the inspection was made and in their judgment determine what they thought it was as of that other date, considering any changes in the property, and considering the way units have been run and other factors.

Q. They would go back to your 1938 figures; for instance, to that unit you found to be in 93 per cent condition?

A. As a compromise they might do that. To be determined most accurately it would be deemed advisable to inspect the property again.

Q. It would?

A. Yes.

Q. And if there had been a good maintenance program followed by that company during the five-year period, you would be apt to find that line in 93 per cent condition again, wouldn't you?

A. There would probably be other things taking place in that line, added other lines and other factors that might enter into it which might affect the overall picture some way.

Q. How would you know that had taken place under your method of determining per cent condition?

A. If I went out and inspected it, I could find what depreciation had taken place.

Q. You would go out and make a new inspection of the line?

A. That would be the most satisfactory way.

Q. You might arrive at a 93 per cent condition again?

A. That is entirely possible.

Q. And you would start out all over again, starting your depreciation all over again?

A. There might have been new property added during that period.

Q. You would relate that per cent condition you found then in 1944 or 1945 to your original cost?

A. I would apply it if I wanted to find out what the depreciation of original cost was.

Q. I believe Mr. Rhodes stated this property, if properly maintained, is apt to last a hundred years or more. Do you remember him making such a statement?

A. I sort of recall a statement on the pipe line itself.

Q. If at five- or ten-year intervals you would have additional proceedings similar to this and every time you would go through the mechanics in order to thoroughly satisfy yourself, you would make physical inspections of those units, wouldn't you?

A. That would depend upon the circumstances. Usually there are additions to property and retirements to property. Retirements affect the overall conditions as well as the overall costs.

Q. The most satisfactory manner to proceed in would be to make those inspections at that time?

A. In my opinion it would be.

Q. Now, in arriving at this per cent condition of property that you do in making these inspections, it is not your opinion that that per cent condition has any relation to the value, is it?

A. What do you mean by value?

Q. The value of the particular unit of property.

A. The value expressed in what terms?

Q. What is your definition of value?

A. You were asking me the question.

Q. The value of that particular unit of property expressed in terms of dollars.

A. I have expressed it in terms of dollars.

Q. Do you relate that per cent condition expressed in terms of dollars for that unit of property?

A. I do. Dollars of the original cost as compared to depreciated cost.

Q. You say there is a direct relationship between the two, between the per cent condition of that unit?

A. The per cent condition—that is how we found the depreciated value, we took the per cent condition against the original cost.

Q. That in your opinion would be the case regardless of what the maintenance may have been on that particular unit?

A. We found it based upon what maintenance had been done, had taken place. We inspected that property as of a certain date and found it in a certain condition. We didn't investigate whether there had been—we didn't investigate whether they had spent so much money for maintenance each year, skipped a year, and so much for another year, but we found out what the depreciation was at that specific date and didn't make a study back to see what the maintenance had been, because we found what the condition was at that particular time.

Q. Then you very definitely didn't follow the definition the Uniform System of Accounts gives of depreciation when it specifically says that depreciation as applied to depreciate gas plant means the loss in service value not restored by current maintenance?

A. We found out what it was at the time, the condition it was in.

Q. Yes, but the fact it had been restored by current maintenance definitely was in the picture, wasn't it?

A. We found out what the condition of the property was at that particular time and didn't make a study of maintenance—at least, I didn't make one myself.

Q. You didn't make one yourself?

A. No.

Q. Then there would be no way to determine what the per cent condition of that property would be a year after that time unless you took into consideration the fact that current maintenance was maintained?

A. I could make a pretty good guess at it.

Q. You could make a pretty good guess at it?

A. Yes.

Q. Taking into consideration the company's maintenance program?

A. The amount of maintenance in that time would hardly affect the picture.

Q. Well, if it were over a period beyond one year, say three years from the time you had made this per cent condition estimate, how would it work out?

A. Well, if I were called upon to do something, I would consider all of the factors and try to determine to the best of my knowledge—

Q. Maintenance would be definitely in the picture, wouldn't it?

A. If they hadn't maintained their structures and they had started to rust, they would naturally be in lower condition that if they had maintained them.

Q. In making your estimate you would certainly want to know what the company's maintenance program was, wouldn't you?

A. I would want to know. Of course, as I said before, I think the best thing to do is to go out in the field and look at it.

Q. If you had known there was no maintenance program being maintained or carried out at all, what bearing would that have upon your estimate as to what the per cent condition would be two or three years after you had made an inspection?

A. I don't think gas companies go that long without keeping their properties in shape.

Q. It is good operating practice to keep up your maintenance?

A. Surely, to a proper level.

Q. If you were considering the unit of property of a company that did that, that would have a pretty strong bearing upon whether the per cent condition of that unit would be maintained, wouldn't it?

A. As I said before, I would have to consider all of the factors entering into that.

Q. That would be one of them?

A. I would consider that.

Q. What portion of the field lines were you actually able to inspect; that is, how many test holes were there on that entire production—or, rather, in the field gathering property?

A. On the field lines there were 125.

Q. 125 test holes?

A. Yes, that we considered in our calculation.

Q. How many miles of lineal feet or miles of line did that cover?

A. I don't recall. We made these inspections at about every $10,000 worth of original cost.

Q. You related it to value and didn't have any figures on the lineal feet of pipe involved?

A. Yes, to get the mileage amount of value you—like we had so much value at 2-inch and that would call for—

Q. Let's take the 2-inch pipe. How many inspections were made on the 2-inch line?

A. There were three.

Q. Three inspections?

A. Yes.

Q. How many lineal feet or miles of 2-inch line are there in the gathering system?

A. I don't know. I can look it up.

Q. Do you have it classified as between the various diameters of pipe in the field line?

A. The number of inspections?

Q. Yes.

A. Yes.

Q. And what did you say the total number was?

A. 125.

Q. 125?

A. Yes.

Q. How many inspections did you make of that unit on your field measuring structures?

A. As I recall it, there were around 23. We had a chronological list of the measuring stations and we inspected every fourth one, at the same time inspecting the equipment, and the buildings. I believe there were 21 of them.

Q. What other inspections did you make?

A. On what unit of property?

Q. Yes.

A. We inspected the Fritch compressor station structure and equipment and we inspected the Fritch camp. Do you mean all the others Mr. Rhodes had testified about?

Q. Limit it to the production and gathering system property.

A. You have covered the field lines and I covered the

field compressor structures and equipment; you covered the field measuring station and equipment, and we inspected the drilling and cleaning equipment plus the general property that has been allocated here.

Q. I notice in Statement 1 of your exhibit you haven't any accumulated depreciation applied to the drilling and cleaning equipment.

A. That is correct.

Q. Why?

A. That is a depreciated figure. We did have a reproduction cost estimate made on that drilling and cleaning equipment by an oil well supply representative and had one of our own men inspect it to determine the condition. The depreciated figure as determined by him was higher than this figure, so I assumed that enough depreciation had been taken from the books to cover the accrued depreciation as applied to that account.

Q. Why did you treat that in that fashion differently? Why didn't you just set up the original cost, as you term it, adjusted and apply your per cent?

A. I could have gone through and found out what the original cost there was undepreciated, but it was such a small amount it wasn't worth while.

Q. But why treat that in a fashion different from all the others?

A. I explained that. There is depreciation on that and not on the other items.

Q. But you didn't set up your adjusted cost on that.

A. No. To go through that and get the original cost on that would be an endless job and so little is involved I didn't think it worth while.

Mr. Dougherty: I think if you would explain just how that is done, it would clear it up. That is, they charge off a certain amount after they bring it back from the wells, and so forth.

The Witness: Well, they had varying methods and that is why it would be pretty hard to determine. It is charged out to a well and comes back at depreciated cost.

Mr. Dougherty: If drilling and cleaning equipment goes out to do a job in some instances they would charge the book cost of that at that time against that well?

The Witness: That's right.

Mr. Dougherty: And then when that would be returned they would put it back on the books at some lesser amount?

The Witness: Yes.

Mr. Dougherty: So as a result of that there would be a lesser amount put on the books for this drilling and cleaning equipment?

The Witness: Yes.

Mr. Dougherty: And this $24,000 is a result that has taken place after a number of these calculations were made after the property was used back and forth?

The Witness: That's right.

Mr. Dougherty: So to get the original cost you would have to go back through the accounts for some time, at the beginning?

The Witness: It would be an endless job, almost.

(Vol. XCVII, pp. 15040-15082.)

* * * * *

Q. Mr. Roberts, in connection with the determination of your accumulated depreciation in Exhibit 272, I want to ask you first whether it isn't a fact that you did not in making that determination take into consideration the life of the gas supply, the company's gas supply?

A. I have told you that I depleted leaseholds and gas well construction.

Q. That's on depletion. I am now referring to your accumulated depreciation as computed against these several units of property.

A. I didn't amortize the property over the life of the field.

Q. In other words, in determining that accumulated per cent in depreciation you did not take into consideration the life of the gas supply?

A. No, I found the condition as I found in the field.

Q. From a physical inspection?

A. From a physical inspection.

Q. And in making that determination you did not take

into consideration any possible retirement of any unit of property for the future?

A. Retirement of the property?

Q. Of any unit of that property—any one of those

A. I found the condition as it was right at that particular date.

Q. That's right, and any retirement due to physical cause at any time in the future is not a necessary factor in determining your present per cent condition?

A. Well, some of this pipe had pits in it that were deeper than others and that piece of pipe might have been retired sooner than another piece, so that that is taken into consideration in that respect.

Q. You mean in determining your present per cent condition you determined what piece of property woud be retired at some future time?

A. I didn't figure just what piece of property would be retired, but I said that there would be items of property that would be retired before other items.

Q. Oh, there would be some items of property retired before others?

A. Yes.

Q. But the fact that some items would be retired before others is not necessary in determining your per cent condition as to the present physical condition of the property at the time of the inspection?

A. We inspected the property—the pipe line as a whole and we found certain of those joints where the pits were farther through than other joints in other sections. Some of that pipe would be retired before the other part, but that was considered in figuring our overall condition.

Q. But in your setting up formula, in determining, for instance, the depth of those pits and the number of those pits, their location and everything, those readings were then computed into your per cent condition, weren't they?

A. That's right. We gave consideration to the fact that certain pits would be deeper than others.

Q. And those that were deeper than others determined whether you had a higher or lower per cent condition?

A. When weighted into the average they would affect the average?

Q. When weighted into the average of the other pit readings?

A. Yes.

Q. And that is the fashion that Mr. Rhodes proceeded in determining per cent condition of the other two Exhibits 68 and 70?

A. Yes, for the pipe line as a whole.

Q. And it was related to the physical inspections that were made at that time?

A. Yes, it was related to that.

Q. Now, turning to your Exhibit 272 again, Page 4 of the written statement—no, let's go back to Page 3, Account 211, "Gas Well Construction." I note there that you depleted that unit of property, didn't you? What depletion figure did you apply there in relation to that unit of property?

A. I determined how much gas was withdrawn from the field during the year compared to the gas—the recoverable gas at the start of the year, and determined the factor and applied it against the investment during that period.

Q. Well, but you have depleted the company's leaseholds—rather, you have determined the accumulated depletion at this time at 36 per cent, but you determined only 31 per cent depletion of gas well construction equipment.

A. That is correct. If the amount of investment of the leaseholds and the gas well construction had, at each period had been the same, they would have all been the same amount of depletion—the same amount of depletion taken place, but the fact that relationship each year of the investment between leaseholds and gas well construction varied, caused this difference in depletion.

Q. That caused the difference between the two?

A. That is correct.

Q. Between the 31 and 36 per cent?

A. On your leases acquired earlier, there would be more depletion on those. Some of those drilled later wouldn't be quite as much depleted on those.

Q. Is that the way the company had it set up on its books?

A. Which?

Q. Gas well construction. Did they deplete that item on its books?

A. You mean, do they figure depletion on gas well construction?

Q. Yes, Account 211.

A. Yes, it is my understanding they do.

Q. Deplete it in the same fashion that you did?

A. I think on comparable figures. They wouldn't be these figures but they would be comparable figures.

Q. What do you mean, comparable?

A. Well, I would have to check up on this, but I believe they are based on the original reserves against the reserves withdrawn, but I will have to check into that to be sure. That didn't enter into my calculation as to how the company may have computed that item?

A. No.

Q. Now, going on Page 4, the Account 212, "Gas Well Equipment," that is the third item on Statement 1, isn't it?

A. Yes.

Q. You have Column 4, "Original Cost Adjusted," $931,900, and I see you have depleted that. You have depleted that 31 per cent, haven't you?

A. I couldn't get in the well to find out what condition the casing was in, and I therefore used this same depletion that I found for the gas well construction.

Q. In other words, you didn't apply your per cent of depreciation against that unit of property, did you?

A. No, I couldn't get down into the well to find out what shape the casing was in.

Q. Why didn't you apply some formula or percentage like you did in your inspection of the field lines?

A. That formula on the field lines had to do with the facts that we could measure on the field lines.

Q. There is no way of ever measuring any of the depreciation on this well equipment?

A. Not very well. The casing is in the well and you can't get in and see it. You might take a photograph of the inside, but not the outside.

Q. How did the company carry their depreciation on this item?

A. I don't recall at this time.

Q. You don't know how it was treated on the books of the companies?

A. No.

Q. Isn't it a fact that they had depreciated this item rather than depleted it?

A. It seems to me that that is a fact, but I am not sure about that.

Q. You aren't sure?

A. No.

Q. Well, isn't—well, you made no investigation of that?

A. No, I didn't investigate that.

Q. You gave it no consideration when you determined to deplete it rather than to depreciate it?

A. No. I know they didn't have any better method than I would have of observing it.

Q. And if as a matter of fact the company did depreciate this unit of property rather than deplete it, what would you have to say about that?

A. Well, I don't know. What they do and what I do here are two distinctly different things. I think that I have been pretty conservative in doing it this way.

Q. In other words, your whole method of approach in setting up accumulated depreciation as well as accumulated depletion on any of the units of property in this Exhibit 272, there is no relation whatsoever to the treatment recorded those items on the company's books?

A. They may have some relation but I didn't figure it the same way, because the company did it a certain way on its books.

Q. In other words, even if the company had treated this item "Gas Well Equipment" as a depreciable item, that would be of no concern to you when you prepared this exhibit, and you on the contrary, or on the other hand, treated it as a depletable item.

A. I used a substitute method. I felt sure that they had no way of determining what condition that casing was in.

Q. Why do you suppose they depreciated it rather than depleted it?

A. Well, if you could find out what condition it was in—the casing was in—it would have a certain physical condition.

Q. They didn't make any inspection of it or attempt to get a per cent condition of it when they set up their depreciation of that item on the books, did they?

A. I don't know what they did, but I felt sure that they

couldn't look at the outside of the casing any more than I could and, therefore, I wasn't interested in what they did.

Q. Well, wouldn't that be a significant item right there for criticism to be leveled at the method of determining accumulated depreciation merely from inspection?

A. Merely from inspection?

Q. Yes.

A. I don't see why there should be any criticism. I feel it is the best way to determine the condition of the property.

Q. Then why didn't you depreciate this unit of property on a formula just like you depreciated the field lines under the ground?

A. This is a particular item of property that is pretty hard to determine by physical condition—observation of physical condition, but that is an exceptional item.

Q. It is a considerable item of property, isn't it, according to your Statement 1, $931,000 some odd dollars original cost adjusted?

A. It is less than 10 per cent of the total.

Q. How's that?

A. It is less than 10 per cent of the total.

Q. That is true, but it is a sizeable item of property in the company's total $10,000,000 as set up on Statement 1, isn't it?

A. I have seen casing pulled from wells, and it has been my experience that the condition of casing would be higher than the amount of depreciation that I have shown, so I believe that I have used a conservative figure in applying that 31 per cent.

Q. Yes, but what I want to know, you were so definite in saying that you can get the closest estimate of a per cent condition, or accumulated depreciation, as you call it, from actual inspections of the property—in fact, you stated that if it were done again that would be the most satisfactory way of doing it, didn't you?

A. Yes, and if one item amounts to maybe less than five per cent of the two properties, was an item I couldn't satisfactorily observe, I wouldn't throw out all of the remaining 95 per cent that I can observe properly.

Q. Now we are just on this one plant of Canadian River.

A. Well, in that case it would be 90 per cent against ten per cent.

Q. And that unit of property, although it comprises more than ten per cent of the total property, you would be satisfied in not having the opportunity of inspecting any portion of it and relating such inspection to a per cent condition?

A. If somebody could tell me a better way of finding the condition and I was satisfied with it, I might use an alternative method, but I figure I have been pretty conservative in doing it this way.

Q. In other words, you would sacrifice the method of determining per cent condition because you couldn't determine that on this item of property?

A. I didn't say that. Referring to that particular one, I used a substitute method.

Q. Although in using that method you can't actually relate the present physical condition of that unit of property to whatever depletion you find?

A. No. If I could have, I would have used the condition I found by the other method.

Q. So on that unit of property the method of determining accumulated depreciation by observation just falls by the wayside?

A. This is a kind of special case here.

Q. You didn't attempt to ascertain how the company was able to satisfy itself in applying depreciation to that unit rather than depletion?

A. Satisfy itself as to what?

Q. As to the correctness of the method of depreciating this unit rather than depleting it.

A. I believe it is a depreciation item but I don't know how they can depreciate it without getting in there to see the casing and that can't be done, so I made no further investigation of why they did it.

Q. So you just determined that because you weren't able to get into the well to actually see the physical condition of the casing that your method of determining the per cent condition wouldn't operate?

A. No.

Q. And you would have to take a substitute method and deplete the unit?

A. I have used a substitute method which I feel is quite conservative.

Q. And you don't think that situation would be applicable to other units of property that you are able to see?

A. No, we have sampled enough of the property to determine what the overall condition is.

Q. Although you have seen only a very small portion of the pipe that is underground?

A. We sampled it at uniform intervals, using the best engineering knowledge that we know of to determine the condition of the pipe in the field and to determine the condition of the pipe without going to the absurd expense of uncovering the whole line.

Q. And you definitely are convinced by making those inspections you can acurately relate the accumulated depreciation in those particular units of property by using your formula of inspecting just certain portions of the pipe?

A. More accurate than what?

Q. Than taking into consideration the life of the unit and other factors that are contemplated.

A. I don't know how you would determine it. I don't know what its life is or will be until it is retired.

Q. You haven't taken into consideration at all the life that unit will function in your field line, have you?

A. We haven't found out this piece of pipe is going to be pulled out of the line in 1941, and that piece is going to be pulled out of the line in 1961, or that piece in the year 2000; no, we haven't done that.

Q. You don't know how long that particular unit will be in service?

A. No, and nobody else does, either.

Q. You haven't attempted to estimate it?

A. No, we haven't.

Q. You haven't related the life of the gas supply to the time that unit will be in service, have you?

A. The length of time, you mean?

Q. Yes.

A. No, not in the case of depreciable property.

Q. You haven't for that reason given any effect to the provisions of the definition that appear in the Uniform System of Accounts?

A. Well, if it says that you should depreciate or amortize it over the life of the field, I haven't followed that.

Q. I will go to your Statement 1, Exhibit 272 again.

These items 213 and 214 under the gathering system, Columns 2 and 3, field line construction and field line equipment, original cost adjusted, $282,334 and $864,459, what do those items consist of?

A. Field construction?

Q. Yes.

A. That is the cost of installation of the pipe and fittings and valves included in the 214 account, field line equipment.

Q. That is all a part of the gathering system in connection with the lines underground?

A. That is right.

Q. How are those inspections made?

A. I have explained how those inspections were made.

Q. The same way as all field line inspections?

A. Yes.

Q. Well, you would have to make these at particular locations in order to be able to at least observe certain numbers of those units, wouldn't you?

A. Let me be sure as to just what you are referring to here.

Q. Let's take 214, field line equipment. Do you know at what locations you would make inspections of that unit?

A. We made the inspections uniformly spaced and the number was determined by the spacing of approximately $2,000 worth of original cost—I beg your pardon. I mean $10,000 of original cost.

Q. In other words, these inspections were spaced the same as the field line inspections and locations?

A. Yes, sir.

Mr. Dougherty: Mr. Lange, that is what they are, the field line equipment—that is, the pipe in the gathering system.

Mr. Lange: Account 214?

Mr. Dougherty: Account 214, pipe and fittings.

By Mr. Lange:

Q. 213, is that part of the same unit?

A. That is the same as the transmission line. They don't separate installation from the pipe. When it is field lines, however, they separate the installation from the pipe.

Q. What I am getting at is this: The same inspection location applied to both of those units? You made one inspection for both of them?

A. We inspected the pipe at that particular point where that particular amount of construction went in but we didn't observe the construction.

Q. I notice that you have given a 7 per cent accumulative depreciation in your Statement 1.

A. That is correct.

Q. That is the same per cent Mr. Rhodes applied to the main line unit?

A. As I recall it, it was.

Q. The main line pipe?

A. Main line pipe and installation.

Q. How do you arrive at that conclusion?

A. I explained that we did this exactly the same as we did the transmission lines of the Canadian River Gas Company and the Colorado Interstate Gas Company in Mr. Rhodes' testimony and his outlined sample he gave the engineers for the Federal Power Commission.

Q. Aren't these units of property subject to be moved as distinguished from permanent locations occupied by main transmission lines?

A. There is more likelihood of it, but in looking over the books I didn't seem to see much indication of it.

Q. Not any of the smaller lines were moved, either?

A. What size lines do you mean?

Q. 2-inch.

A. I don't know whether the 2-inch lines were moved or not, but it is a small per cent of the total.

Q. Were there any 4-inch lines moved?

A. I don't recall just what percentage, but I believe that it is such a small percentage that it would not represent much of the value that is set out here in Account No. 213.

Q. These lines were laid at the same depths as these main transmission lines were laid?

A. I think the 22-inch line is the same.

Q. I am not referring to F-1 now, but I am referring to the other field line.

A. I don't think there was very much difference, but I would have to investigate.

Q. When you made your inspection, weren't you able to tell at what depth those lines were laid?

A. I did know but I don't remember how deep this 4-inch line was as compared with the main transmission line.

Q. Ordinarily the field lines are not buried at the depth the main transmission lines are?

A. Not the main transmission lines, no.

Q. You say you didn't find any of those lines had been moved, or very few of them had been moved?

A. I didn't make a complete study of that, but in preparing the inventory I was able to note to a certain extent that it appeared to me as not being a big factor when compared to the total.

Q. So you just took the same percentage that applied to the main transmission line?

A. No, we observed the conditions of the field lines independently of the main line.

Q. Without applying the weighted average to both the main line and the field line?

A. No, the field lines were figured separately.

Q. Did you arrive at the same percentage?

A. That is correct.

Q. Now, these items 221 and 224, the compressor station units, they were inspected in the same fashion Mr. Rhodes inspected the ones listed in Exhibit 68 and Exhibit 70?

A. They were inspected by the same men as the items covered in those exhibits were inspected in the same way.

Q. You referred to this Statement 1 as setting forth adjustments to original cost, Page 8, Exhibit 272.

A. What page?

Q. Page 8.

A. Yes.

Q. You say: "To apply the determined extent of depreciation and depletion to original cost, it was necessary to segregate therein certain general construction costs which had been distributed • • • "

A. Wait a minute.

Q. • • • which had been distributed to the several accounts, which adjustment is shown on the attached Statement No. 2."

Referring first to Statement 1, where do those adjustments appear?

A. The amounts up above do not include the general construction cost set down below.

Q. But you didn't apply adjusted figures there as you reclassified those items, did you not?

A. I considered an adjustment and a reclassification as the same thing. That is what I meant by that.

Q. What was the purpose in taking them out of your original cost and setting them forth separately under Item 20?

A. The amount of depreciation applied to these general construction costs is not the same as the amount applied to the property. That is explained on Page 7 toward the bottom there.

Q. Yes, but they are applicable to each unit of property, aren't they?

A. That is true, but if a piece of pipe depreciated so you had to replace it, you wouldn't have to go and design that line to replace it.

Q. You just took it upon yourself to take that out of original cost as per books and set it out separately under Item 20?

A. That is correct.

Q. You applied a different per cent of depreciation to that item than would have been applied if it had been permitted to remain as it had been on the books?

A. That is correct.

Q. How do you justify that?

A. I just explained that if you had a piece of pipe in a pipe line or a section of the line that had to be replaced you wouldn't have to redesign the line to replace that pipe, and if you had a building where the roof needed to be replaced you wouldn't have to redesign the building to replace the roof.

Q. On that particular item you decided not to follow the company's accounting practice but instead you took them out of the original cost figures and set them up separately?

A. That is correct.

Q. Did you have in mind the provision of the Uniform System of Accounts on that character of treatment of the item referring particularly to Instruction 6, Page 42?

A. I determined what I thought was the depreciation applying to the property.

Q. And you didn't follow the company's treatment of the item at all?

A. I believe not.

Q. I believe you stated that you didn't hold yourself out as an accountant?

A. I didn't claim I had.

Q. You wouldn't be able to say that was good accounting practice or not, your method?

A. Good accounting practice not to depreciate overheads?

Q. To treat them as you have, contrary as to what the company has treated them.

A. I wasn't treating this depreciation as an accounting item, as I was trying to determine what the actual depreciated cost of the property was and that didn't enter into it.

Q. You related it entirely to an engineering approach?

A. Principally, yes.

Q. I just want to be certain that what you say in Exhibit 273 is exactly how you proceeded. You quoted Mr. Rhodes on that, that it was determined from observations of the physical conditions of the property.

A. That's right.

Q. So you didn't attempt to serve any accounting problems in connection with the treatment?

A. No, I didn't.

Q. Or you didn't give any consideration to what violations of accounting method that may follow, if any?

A. I didn't make any violations in accounting because I wasn't interested in the accounting.

Q. Well, if you weren't interested in the accounting of it and didn't attempt to hold yourself out as an accountant, how did you know that you hadn't violated any principles of accounting?

A. Because I wasn't setting forth an accounting exhibit.

Q. You didn't in any fashion intend to relate your treatment of depreciation and depletion to any accounting method at all?

A. No. I didn't try to tie this into the amount of depreciation that they should set up on their books for a year.

Q. Or as to any method that accounting practice would sanction for the treatment of depreciation or depletion?

A. Oh, I think that they would sanction what I have done as part of their determination of what they should set up.

Q. But you don't claim that you have any knowledge of proper accounting procedure at all?

A. I am not claiming that I am an expert accountant.

Q. And further in connection with that very item of general construction costs, Item 20 of Statement 1, again, I see in addition to your treatment of that item separately from the way it has been treated by the company, you determined the amount of depreciation just as a judgment figure, didn't you? You determined the amount of accumulated depreciation as—

A. I believe I made a statement in here that "All things considered one-half of the total amount of undistributed construction costs is appropriately considered as depreciating with the depreciable property."

Q. Now, when you get down to this line: "All things considered one-half of the total amount * * *"

A. That's just what I read.

Q. That is purely a judgment figure, isn't it?

A. It is based upon our experience as engineers and judgment of the firm for properties like these properties.

Q. Do you mean a judgment as engineers without giving any consideration to the actual history of this particular unit of property?

A. Well, comparable properties. We have been constructing gas lines.

Q. Well, did you give any consideration to the fact that those general construction costs are overhead, as you may call them—are still in 100 per cent condition as the property goes out?

A. I didn't say that.

Q. What?

A. We took one-half of the depreciation.

Q. One-half?

A. One-half.

Q. Well, then, how do you assume that one-half would be the proper figure applicable?

A. I have told you it is based upon our experience as engineers, knowing what kind of work has to be done and what would have to be done if you replaced part of this property.

Q. Well, that one-half, though, that you arrived at in the life of your experience would represent 100 per cent condition of the overhead item, wouldn't it?

A. One-half of what?

Q. The one-half that you took would be in 100 per cent condition, wouldn't it?

A. One-half would be in 100 per cent condition and the other half would be depreciated according to the rest of the property, is that what you mean?

Q. Yes.

A. That would be one way of figuring it. We took one-half of the depreciation overall.

Q. And applied that as a judgment figure in the light of your experience?

A. Yes.

Q. Then under that method of treatment, that one-half, if you filled them out, it would be in 100 per cent condition at the time the property was ready for abandonment?

A. Half of the overhead?

Q. Yes.

A. Yes, if you worked it that way it would be.

Q. And the company never took that position in treating these overheads in that fashion on the books, did they?

A. No, and they didn't depreciate land, either.

Q. How did you treat rights of way, Item 206, Statement 1?

A. We didn't depreciate that.

Q. No. Now, then, where do you explain your treatment of land, rights of way?

A. It is Item 3.

Q. Oh, yes. No depreciation was taken on Account No. 206, rights of way, was there?

A. No.

Q. Now, what were you just about to say as to the company's treatment of that item?

A. I say, in the case of land they don't depreciate land, either, and we didn't depreciate land.

Q. Well, you mean land held in fee?

A. Land held in fee, yes.

Q. How about rights of way?

A. I am not sure what the company does about that.

Q. You gave no consideration to the treatment the company gave that item?

A. No.

Q. Well, these rights of way are distinguished from land held in fee, aren't they?

A. Yes.

Q. Well, if the line is abandoned or not used, what is the value of those rights of way?

A. If the pipe lines are retired on account of depreciation they would put another one in there just as good as it was before.

Q. Well, who would put another one in there? We are talking about this particular line right now.

A. Well, if the property is abandoned it is no longer an operating property.

Q. Well, what value would rights of way have?

A. The rights of way would have no value if you weren't operating the property.

Q. Where do you show any land held in fee in your Statement 1?

A. Statement 1, Account 218, "Field Measuring Stations and Land."

Q. Is that the only land the company has in fee in?

A. In the production and gathering systems themselves, but there is part of the land in the general system that we have allocated to these properties.

Q. Where does that appear?

A. That is on Statement 3, Account 218, "Land Bivins Camp."

Q. Item No. 1?

A. Yes.

Q. Where else?

A. I believe those are the only items of land held in fee.

Q. So you have treated land held in fee and rights of way in the same fashion?

A. That is correct.

Q. Now, I believe you stated that the only time that you ever had anything to do with the computation of service lives was working under someone else in connection with the valuation of this steam plant?

A. I believe that those are the only ones that I recall right now.

Q. You haven't made any attempt to estimate the service

lives on any of these units of production and gathering properties in this Exhibit 272, have you?

A. No, I haven't.

Q. You didn't think that was of any necessity in determining your accumulated depreciation?

A. No.

Q. It would not?

A. No.

Q. Regardless of the service life of any one of those units that you have depreciated, that wasn't essential to the determination of your accumulated depreciation figure?

A. Well, I don't know just what you mean by service life, but we found out actually how much depreciation had actually taken place. Of course, that might enter into service life.

Q. Well, in your treatment of the gas well equipment account, 212, where you found that you weren't able to apply your method of inspection for the determination of depreciation, you depleted that unit, didn't you?

A. I said as an alternate method I used the same figure as I found for the depletion of gas well construction.

Q. Well, doesn't that have some relation to the determination of the service life of the unit?

A. I was determining the depletion of the gas well construction.

Q. Well, in determining service lives, relating it to the experience you had in connection with that steam plant, you found it helpful in setting up your accumulated depreciation there, didn't you?

A. I found it helpful for what?

Q. You found it necessary, didn't you?

A. Necessary to do what?

Q. To determine the service lives.

A. I didn't determine it myself. I said I worked on that job.

Q. They were determined, weren't they?

A. I don't know whether they determined service lives or determined the amount that should be set up on the books for depreciation.

Q. Well, as I understood you to say, a service life study was made in connection with the determination of setting up depreciation on the company's books.

A. The service life might be interpreted two ways, and I want to explain that I didn't get into very much detail on that job. I just mentioned that job where work of that nature was done, but I didn't have very much to do with it.

Q. In all of your experience in connection with valuation work, haven't you ever made any study of the use or usefulness of service life estimates?

A. We have made some estimates of the rates that should be set up on the books for depreciation annually, but I haven't had so much to do with those things. I have come off of one job and maybe I would help out some.

Q. And you haven't had occasion to make a study of the use of service lives in determining your depreciation of any units of property?

A. Determining depreciation?

Q. Yes.

A. You mean to be set up on the books.

Q. Yes.

A. Well, I said we have made field observations for the accountants and what figures they should set up for depreciation.

Q. Well, so in that particular instance you don't recall at all how they proceeded?

A. I am not sure of the final figures.

Q. Well—rather, the mechanics involved?

A. No, as I say, I never have been in charge of one of those jobs. The work I had to do on that was just incidental.

Q. Well, don't you think as a matter of determining accurately the accumulated depreciation in any unit of property that if you first determined service life that you would have a more dependable basis to work with, rather than just periodic inspection alone?

A. I would like to know how you would find a service life first.

Q. How you find the service life?

A. Yes.

Q. You have never made a study as to the method or manner of making those determinations?

A. I have seen lots of it done where they sit in the office and say the service life is so much.

Q. Is that what you did in connection with that steam plant?

A. No, it isn't.

Q. How did they go about it?

A. I said that I am not sure of the details on that.

Q. They found it necessary, didn't they?

A. To set up a service life?

Q. Yes.

A. They determined how much depreciation should be set up on the books each year, as I understand it, and I have stated I didn't have much to do with that job.

Q. You don't mean to say that isn't a proper way of proceeding?

A. It is not the proper way to make a guess as to what service life is.

Q. Is this inspection one of just a certain number of units of property without relating it to the other factors that are set up in the Uniform System of Accounts definition of depreciation to correctly determine the accumulated depreciation in a unit of property?

A. I think the proper method is to go out in the field and inspect it as we have. I feel we have the amount of depreciation that exists in this property.

Q. Whenever that has to be done again at some time in the future, you are going to go about it in the same fashion, doing it all over again?

A. If you did it all over again you would go about it in the same fashion.

Q. You would think that to be the most practical way of setting it up on the company's books over a period of years?

A. I wouldn't expect the company to have us coming down here each year to find out how much depreciation had taken place for the current year, no. I am not setting up something on this exhibit to be used on their books as the rate of depreciation.

Q. You are not?

A. No.

Q. What are you setting it up for?

A. I wanted to determine how much depreciation has taken place in this property.

Q. Why are you computing it on this basis if you don't expect the company to pay any deference to it?

A. I don't know whether they will or not. That wasn't

my job. My job was to go out and find out how much depreciation and depletion had taken place in the property.

Q. Regardless of what the company may accord on its books?

A. That is right.

Q. Without relating it to anything the company had heretofore done in the treatment of the items on its books?

A. No, I didn't relate these figures to their figures as far as the depreciation goes.

Q. As far as you know, you don't know what character of entry is contemplated to be made on the company's books as to depreciation?

A. I don't know.

Q. You didn't in any manner take into consideration the company's past experience or requirements or its past history in determining your per cent depreciation or accumulated depreciation?

A. Experience as to what? What do you mean?

Q. As to the unit of property treated by you, the history of those units.

A. You mean the property that was retired?

Q. The units of property that you treat in Exhibit 272, all of them.

A. You mean items that have been retired prior to then? I don't know what you mean.

Q. Those that are to be retired as well as those that were still in service when you made those inspections.

A. Those retired weren't inspected as they weren't there.

Q. You gave no consideration to those retirements at all?

A. They weren't there and we didn't inspect them.

Q. You don't know and didn't attempt to relate your inspections in 1939 to the company's past history or experience with reference to retirements?

A. There is no retirement in here.

Q. You don't take cognizance of any retirements but you didn't take cognizance of what happened prior to the time of your inspection or as to what retirements might take place in the future?

A. We didn't estimate what the retirements would be in the future as we were inspecting the property that existed at that date.

Q. Mr. Roberts, on your Statement 2 of the exhibit, I call your attention to the general construction costs that are set out there under Items 20 and 21, the allocations that you made. Can you identify these items of $47,668 in Column 2 and $6,402 in Column 6? I notice you have a notation at the bottom of the statement that the A figure affixed to each one of them means plus.

A. That simply means we took them out from above and added them to the general construction cost below. The heading over all of those items is "Deduct General Construction Cost:" therefore, if we had followed that, we would have deducted this item under "General Construction Cost" which would not have transferred it, so we indicated that was a plus item rather than a minus item and it simply transfers it from the direct cost above to the general construction cost below.

Q. In other words, those items in Column 5 and 6, the construction costs, would be distributed by the company and you redistributed them, did you not?

A. That is right.

Q. And you set them apart on Line 24 as separate items?

A. That is right.

Q. Mr. Roberts, I want to ask you this: Have you ever heretofore set up any comparable depreciation and depletion figures for any other plant than the Canadian River and the Colorado Interstate?

A. We have made estimates of the amount of depreciation of almost all these valuations I worked upon.

Q. The depreciation?

A. Yes.

Q In which of those did you determine any depletion figures?

A. Depletion?

Q. Yes.

A. Let me see. I worked on various jobs where the depletion was involved, but as far as any—

Q. In any extractive industries?

A. Most of it has been in the gas industry, the natural gas industry. We usually had somebody else that did that and maybe I would help along.

Q. You haven't heretofore set up any depletion schedule in connection with any natural-gas company, have you?

A. No, but it is a very simple matter. You have so much gas to take out; so much gas, and there will be a certain amount left. It is a simple mathematical formula and if you have so much investment there it gets that rate, so anybody can do a thing like that.

Q. It is just a matter of simple arithmetic?

A. The geologists can tell me the figures and withdrawals and I can figure it or anybody else can figure it.

Q. This determination of accrued depreciation is an entirely different problem?

A. That involves more detailed inspections. You can't go to a lease and look at the gas below the ground. You can go to a pipe line and move the earth off of it and look at it but you can't do that in a lease.

Q. You get into the realm of estimating when you start determining your per cent condition, don't you?

A. No, I think depletion is more in the realm—

Q. You just stated you got actual figures there from somebody and—

A. I said if they supplied the correct figures—

Q. You presume they are correct?

A. That is a mathematical calculation.

Q. You don't go beyond the presumption as to whether the figures they supplied are correct or incorrect?

A. I believe they are as accurate as could be determined. Not being a geologist, I didn't go over his work and make an independent study of it myself.

Q. You wouldn't care to get into that province of it, would you?

A. It might be an interesting one to take on.

Q. These calculations of the geologists would be more accurate than anyone else's calculations?

A. Be more accurate?

Q. Yes.

A. From their experience and great knowledge of the field, they know what is taking place. Some of them may differ but I think the ones that are the most qualified know pretty well.

Q. That is it. In other words, you begin with definite figures that they give you in determining depletion and there aren't any estimates you make at all?

A. I don't make any estimates at all. It is strictly a mathematical problem.

Q. The mechanics of the determining of depletion, as far as your province is concerned in constructing an exhibit like this is very simple when you are treating depletion alone?

A. It is.

Q. But where you have to determine per cent conditions with the use of your formula, you get into the realm of making estimates?

A. We correlate the facts as we find them ourselves. In the other case the geologists correlated the facts and we used them.

Q. That's right, and you took the figures as they gave them to you and you didn't apply any estimate?

A. No, that was just mathematical from that point on.

Q. But you do necessarily have to apply estimates in determining your per cent condition in arriving at these depreciation percentages as computed by you?

A. We make an estimate based on the best engineering knowledge of how properties should depreciate.

Q. You think that delving into the realm of estimates is much more practical than to apply figures as you do in determining your depletion?

A. I think it is a lot more practical to look at the pitting on pipe than to make an estimate on something underground that you don't know the conditions of as well as you do about the pitting of the pipe.

Q. Yes, these pipe pittings that you see are just certain portions of your pipe, nothing else?

A. By sampling method we can determine quite accurately what the condition of the pipe is as a whole.

Q. Yes, but after all it is an estimate.

A. Yes, it is an estimate.

Q. And it differs in that respect very basically from the determination of depletion as you have made it?

A. No. They first had to make an estimate of the gas that was in there and the gas that was taken out.

Q. Well, as far as you are concerned, though, you didn't have to make any estimate at all in applying your depletion figures?

A. No, I said it was just mathematical as far as I was concerned. As far as the way I figured it, it was just mathematical, but they were based on estimates by others.

(Vol. XCVII, pp. 15084-15122.)

* * * * *

Q. When you put a depreciation of seven per cent on the field line equipment, Account No. 214, is that an overall percentage for the whole field pipe line system as represented by that account?

A. It is.

Q. And in arriving at that, do you weight in an average or take into consideration the specific condition of all of the pipe as found in the inspection made?

A. Yes.

Q. Would it be correct to say that you might have some pipe there that was only in 70 per cent condition and in others it might be in 98 per cent condition?

A. It is entirely possible.

Q. This percentage figure you give is not with reference to any particular section or any particular line?

A. No, it applies to the account as a whole.

Q. And to the property as a whole of that character?

A. Of that character, yes.

Q. A number of questions were asked you in connection with the determining of the condition of pipe by the number of years the pipe was in the ground. Is it at all necessary for you to know the number of years the pipe was in the ground in order to determine the physical condition by observation?

A. No, it is not.

Q. Do you find at times pipe that has been in the ground 30 years might be in better physical condition than pipe that has been in other places ten years?

A. I have often seen that in inspecting pipe.

Q. Your method, as I understand it, is to find out where between zero and 100 lies either the depreciation or the condition of the property?

A. That is correct.

Q. What you did in this case was by observation to determine that relationship between zero and 100 was seven per cent for depreciation overall?

A. That is correct.

Q. In connection with the matter of measuring pits and considering pits, does the method Mr. Rhodes employs and you employ involve an estimation of what the deepest pits in a joint of pipe 40 feet long would be, making that estimation by some means of considering those which are actually observed?

A. Yes, by observation and the use of the formula we could determine what the deepest pit would be in a 10-foot section, a 20-foot section, or a 40-foot section.

Q. I believe Mr. Rhodes explained that, did he not?

A. I think he went into some detail on that.

Q. Do you, however, make that estimation and consider the depths of pits so determined by your formula as well as those you actually observe?

A. We do.

Q. When these inspections of Canadian River pipe were made, do you know whether any of the Federal Power Commission's engineers were present and made observations of their own?

A. Yes, they did at the same time.

Q. A number of questions were asked you with respect to previous determinations of depreciation as having been made in connection with reproduction cost estimates of property. Are these percentages which you have found as being accumulated depreciation related to the physical property itself?

A. Yes, they had to do with how much of the total depreciation had taken place and it was determined in the form of percentage.

Q. Could that properly be said to be a physical factor with reference to the condition of the line as distinguished from any monetary factor?

A. Yes.

Q. If you want to find out the per cent depreciation in all the property, you could by weighting these various percentages get some overall percentage?

A. Yes, that is generally the way we do.

Q. But in order to know what that would be in dollars, is it necessary to relate that percentage or those percentages to some dollar figure?

A. Yes.

Q. Now, whether you relate that to a dollar figure that was the actual cost of the property when installed or whether you relate that to what it now would cost to replace that property, does that have any effect upon the actual percentage of depreciation physically that has occurred?

A. Not for those specific items, but if you are averaging in different things with a different weighting, naturally the percentage might vary slightly.

Q. That would be because of the different dollars that are reflected in the different property accounts?

A. That is correct.

Q. Questions were asked you about rights of way, something about the fact that upon abandonment of the pipe line or any pipe line that right of way then would expire. As far as the physical condition of the right which the land owner grants for the pipe line company, is there any difference in that the day before the pipe line is retired and the day immediately after the pipe line is put into operation?

A. Not as far as I can see.

Q. In using that term "right of way," I am referring to the grant which the land owner gives and not the physical condition of it. When abandonment does occur, there would be a hundred per cent retirement immediately, would there not?

A. There would.

Q. With respect to the overheads which you say do not depreciate, would that same thing hold true; namely, that there is no depreciation but upon abandonment they are expired or are retired at once?

A. That is right.

Q. Do those overheads serve their purpose and serve the various things that were done as the result of their expenditure in the same way immediately before abandonment just as after they are expended?

A. Yes.

Q. What you are talking about here is not an amortization of either rights of way or of overhead but physical condition?

A. That is correct.

Q. With respect to depletion, do you know of any way to determine what depletion has taken place in a gas property, a natural gas leasehold, except by having knowledge of the gas that has been taken out of it with reference to what was there?

A. No, I do not.

Q. Isn't that what depletion means? Isn't it the depleting of what ever the resource is or whatever the product is?

A. That is my general understanding and the way I have seen it used.

Q. If one-half of the gas has been taken out, then you would say there had been 50 per cent depletion of that reserve?

A. That is correct.

Q. And if you wanted to get that in dollars you would apply it to whatever your dollar base was?

A. Yes.

Q. In arriving at depletion, as I understand your explanation, you would figure it in dollars for each year?

A. That is what I did.

Q. That is, you would take the ratio between the gas withdrawn during the year to the quantity that was in there at the beginning of the year?

A. That is right.

Q. If that happened to be 10 per cent, you would compute depletion for that year as 10 per cent of the gas whether it is cost or otherwise?

A. That is correct.

Q. You did that for each year?

A. That is correct.

Q. When you got to the years through 1938 you added up those yearly or annual dollars of depletion and that gave you the total depletion for the whole period?

A. Yes.

Q. Then, as I understand it, you eliminated any retirements that had taken place at leaseholds or wells prior to December 31, 1938?

A. That is correct. We made that adjustment first.

Q. What you were doing was figuring depletion on the property which was in the possession of the company on December 31, 1938?

A. That is right.

Q. Then after having added up the annual dollars of depletion, did I understand you related that to the original cost as represented here and that gave you the percentage of 36 per cent?

A. That is the way it was done.

Q. 36 per cent is the result of the computations we have discussed?

A. Yes, dividing one figure by the other.

Q. That same thing was done with gas well construction?

A. Yes.

Q. I assume you would have the same percentage of depletion to apply against whatever the cost of either gas well construction or equipment was at the beginning of the year?

A. That is right.

Q. That is, if you found 10 per cent of the gas had been taken out that year, that 10 per cent would be applied both against the cost of leaseholds and also against the well construction and equipment?

A. That is right.

Q. And in doing that you arrived at the dollar amount of depletion for each year?

A. Yes.

Q. Adding those up you then related that to the original cost and that is how you got the 31 per cent?

A. That is correct.

Q. What I wanted to bring out was the 31 per cent was the result of the dollar computation each year rather than a direct result from percentage computations.

A. It is determined as an overall and divided back.

Mr. Dougherty: That is all.

Recross Examination.

By Mr. Lange:

Q. Mr. Roberts, you just stated your per cent depreciation or your per cent condition had no relation to dollars or value at all, is that right?

A. I said we first determined what per cent it had depreciated and then applied it against the dollars. If you take the overall percentage that was determined it would reflect the dollar weighting.

Q Let's see how your method works out. Just for the sake of argument, let's take your final suspension of operations. I think according to your salvage value exhibit it was in January 1956, wasn't it?

A. According to that exhibit it was.

Q. And the plant has been in operation since sometime in the year 1928, hasn't it?

A. Yes.

Q. Now, at the end of the year 1938 you made this inspection of the property units and applied to each of them a per cent condition, didn't you?

A. Yes.

Q. You took the per cent condition and related it to what you determined accrued depreciation and then arrived at the per cent of accumulated depreciation which you in turn converted into dollars, didn't you?

A. Yes.

Q. And you applied that against what you determined the original cost adjusted for every unit of property?

A. Yes.

Q. Well, let's take one unit, the main line pipe, say, that was given a percentage. It was given a 93 per cent condition as well as your field line pipe, wasn't it?

A. Main line pipe on the Canadian River was the same as that.

Q. Your field line pipe in Exhibit 272 was given a 93 per cent condition, wasn't it?

A. It was.

Q. That, related to accumulated depreciation, gave you a seven per cent accumulated depreciation which you in turn converted to dollars?

A. That is correct.

Q. And you subtracted it from your term "Original Cost Adjusted"?

A. It is not substracted on the statement there as it just shows the amount of accumulation depreciation there.

Q. It just shows the amount of accumulated depreciation.

A. Yes.

Q. Now, then, supposing that you were to have another appraisal which included inspection of these units of property in the year 1954, let us say, and you would find that the main lines or field lines were in 93 per cent condition. You would then relate the seven per cent accumulated percentage to that unit, wouldn't you?

A. If we found it had depreciated that much, we would.

Q. If you found it depreciated only that amount, you would have a 93 per cent condition at that time?

A. Yes, sir.

Q. With a related seven per cent accumulated depreciation against that unit?

A. Yes, sir.

Q. Well, then, the next year you would come to what you might term the end of the road, the operations would

cease and the plant would be salvaged, what would you do then?

A. It would be salvaged for what you could get out of it.

Q. When does that difference in value take place between your 93 per cent condition you have in 1954 and the zero condition which you have in 1956?

A. When it ceases operation.

Q. Does that all take place in one year or in six months?

A. The difference between the 93 and zero.

Q. The difference between 93 and zero?

A. If we inspected and found that property was in that condition at that time, when it was no longer operated it would no longer be of use.

Q. Under your method of computing depreciation, that entire difference in value or decline in value takes place in one year, doesn't it, from 93 per cent to zero?

A. You are taking quite an extreme case there.

Q. Let's assume that the line was properly maintained as it is now and you would have a 93 per cent condition or a 90 per cent condition.

A. If you went out of operation, of course then you wouldn't have that pipe as being useful.

Q. That is right. In other words, if you had a 90 per cent condition in 1954 from your inspection and the next year the operations ceased and you salvaged the plant, you would have a zero there. When does that decline in value take place?

A. If we inspected it at a certain date and it went out of operation at another date, it would take place between the two dates.

Q. It would take place in the interim?

A. If a year's difference, it would take place at the date of ceasing operation.

Q. So it could take place within one month if your inspections were one month before you ceased operation in 1956?

A. An explosion could take place in an engine and destroy the engine in the same way.

Q. We will just assume normal operation and normal maintenance. As I say, you would by inspection find that the main line pipe in the middle of the year 1954 had a 90

per cent normal condition. That isn't unusual, is it, to assume that?

A. That you had 94 per cent condition?

Q. A 90 per cent condition.

A. Of your pipe line?

Q. Of your pipe line in the year 1954, the middle of the year, say.

A. A pipe line could be in that condition on that date.

Q. Then on January 1, 1955 the line is abandoned and salvaged and there is no salvage there, and then the decline in value would be taking place during that six months, wouldn't it?

A. Yes.

Q. Oh, yes, one more question: What in your opinion would have been the per cent condition of, well, say a unit of main line equipment in 1938 if the company had never expended any funds for maintenance of that main line from the time of its installation?

A. Maintenance of the pipe line doesn't affect the pits on the pipe line. You can't maintain the pits.

Q. Oh, you replace those units that are badly pitted, don't you?

A. When it becomes necessary, you do.

Q. And if they aren't badly pitted—you either have to scrape the pipe or do whatever maintaining that is necessary when it is not required to replace a unit, don't you?

A. You don't scrape the pipe.

Q. Well, what do you do — whatever is necessary to maintain it in proper condition, don't you?

A. Well, you don't do anything to it unless there are leaks indicated.

Q. Haven't you taken out any units of pipe and scraped them and painted them?

A. Not unless there are leaks indicated, or that pipe happened to be exposed and you saw that it was pitting pretty badly and made a further inspection.

Q. What character of main line maintenance has your company carried on?

A. It's not my company.

Q. I mean the Canadian River Gas Company and the Colorado Interstate Gas Company.

A. What kind of maintenance?

Q. Let's confine it to Canadian River Gas Company right now.

A. I haven't made an investigation of what their maintenance has been on these main lines and what they have charged in there.

Q. What character of maintenance is ordinarily carried on in connection with your field lines, for instance?

A. If they did find a leak and it was advisable to put a band clamp on it, they would.

Q. All right, what other item of maintenance is ordinarily carried on?

A. If the top soil over that line washed away, they would replace it.

Q. All right, what else?

A. If the packing in a valve leaked, they would repack it.

Q. Don't you ever recondition any units of that field line?

A. You say, have they?

Q. Yes.

A. I am not sure whether they have or not.

Q. Well, in your experience in connection with that kind of valuation work, you would be familiar with the ordinary maintenance operations that would be carried on in the field, wouldn't you?

A. Every company doesn't carry on the same maintenance policy.

Q. Haven't you familiarized yourself to know what the character of maintenance is that the Canadian River Gas Company carries on in its field operations?

A. We know that our inspections didn't show any badly leaking pipes, and we know that as far as the condition of the pipe is concerned, there was no pipe that was in very bad condition.

Q. Well, then, let's relate this question that I just asked entirely to field lines: if there had been no maintenance carried on whatsoever by the company since the time of the installation of those units, would you still have found them to be in 93 per cent condition in 1938?

A. Probably not. The lack of maintenance is liable to cause fast deterioration but the application of maintenance does not increase the condition. Take, for instance, an engine. If there was a leak in the cooling system, it might be repaired at a small expense, but if that were neglected it might cause the ruining of the cylinders and the pistons.

Q. Well, that's right. That's what I was just getting at.

An ounce of prevention is worth a pound of cure in that instance.

A. That is true.

Q. So an ounce of maintenance at the proper time is very necessary.

A. Absolutely.

Q. I don't believe that you have answered that first question that I asked you: what your opinion would be as to what per cent the condition of this main line—or whether you would have found a 93 per cent condition of this field line of Canadian River Gas Company in December 31, 1938 if there had been no maintenance of any character at all, since the time of the line's installation.

A. I didn't make an investigation of exactly what the company had done in the way of maintenance since the start or what they charged in there. I observed what condition that line was in and if the pipe, if there had been a washout and the pipe had been left exposed to moisture, there probably would have been more pitting there, but that wasn't indicated from our observation, but we didn't need to know just what the company had done to determine what that pipe condition was.

Q. In the light of your experience in connection with the examination and inspection of field lines of similar character, your opinion would be, wouldn't it, that the per cent condition that you would have found in December 1938 would have been lower if there had been no maintenance whatsoever on the line from the time of its installation?

A. You mean the way the books would set a certain charge at a certain amount of maintenance?

Q. No. You found a 93 per cent condition in December 31, 1938.

A. Yes.

Q. Now, if there had been no maintenance whatsoever on that unit of property from the time of its installation in 1928, or thereabouts, up to December 31, 1938, in your opinion, wouldn't the per cent condition of that unit of property have been less than 93 per cent in December 1938?

A. It could have been less or it could have been the same. It might not have been necessary to do any work on the line.

Q. It might not have been necessary would that have been probable?

A. It depends on the length of the period and the type of the soil.

Q. That was about twelve years.

A. Well, there are other factors that enter into that.

Q. Well, just assume that there were some conditions that arose that made maintenance necessary and no maintenance had been performed.

A. No maintenance had been performed?

Q. Yes.

A. Well, for instance, if the soil was washed away from the top of the pipe, as I said before, and the pipe was subject to alternate the dry and wet and maybe some other elements that would deteriorate the pipe, we would have found that that pipe would have been pitted more than it was if the soil had been put back over the pipe and the line kept with a covering over it.

Q. So if that instance had occurred and there had been that lack of maintenance, you would have found a lower per cent condition?

A. With those other circumstances taking place as I have indicated.

Mr. Lange: I believe that is all on this exhibit.

Redirect Examination.

By Mr. Dougherty:

Q. Mr. Roberts, Mr. Lange asked you about the decrease in value of pipe as a result of abandonment, relating that to inspection which you might make say six months before or a month before abandonment in which you find the condition of the pipe 93 per cent.

Let's assume that you were asked a month after abandonment to go out and determine the physical condition of the property. Might it not still be 93 per cent?

A. Yes.

Q. And whether or not the property is in use, has no connection with its physicial condition as you find it on inspection?

A. That is correct.

Q. Is what he is referring to a question of amor-

tizing the investment because of the economic end of the business rather than any depreciation physically that takes place in the property?

A. That's the way I feel about it.

Q. And that pipe, some of it, you have taken up and in good physical condition would still be whatever per cent condition you would find it in?

A. Yes, sir. It would still be in the same condition.

Q. Your figures here are related solely to the physical condition as related to the dollars?

A. Yes.

Q. And have no consideration of how long the property is going to be used?

A. No, we didn't give that consideration in the case of the main line pipe.

Q. Let's assume that having in mind what Mr. Lange talked about service lives, that before the end of the abandonment according to that method of figuring depreciation you would have only a 20 per cent condition; namely 80 per cent depreciation.

In your experience could such pipe be utilized in the operation of a pipe line if its physical condition were only 20 per cent and had actually depreciated 80 per cent.

A. No, because in that condition there, on the average, there would have to be a lot of joints of pipe that were leaking badly and the loss and danger involved would make it not feasible to operate the property.

Q. Isn't it a fact that right up to the last day of abandonment the property has to be in good enough condition to operate to take the gas through?

A. Yes.

Mr. Dougherty: That's all.

Recross Examination.

By Mr. Lange:

Q. What, in your opinion, as an operating problem, is the lowest per cent condition that a main transmission line should be kept in to function properly?

A. I have not tried to determine what the lowest per cent would be.

Q. Well, approximately—to function properly?

A. Well, to be functioning properly you naturally wouldn't want any leakage in the line. You would have to keep the leakage down to a minimum.

Q. What in your judgment would be the lowest per cent that should be permitted?

A. I wouldn't operate a company that way. I would try to go out and find where the leaks were and if I found them I would put clamps over them and if they were bad enough I would recondition the pipe.

Q. That is true. That is proper to keep proper maintenance on the line.

A. Yes.

Q. But I am just asking you hypothetically what in your opinion would be the lowest condition that a line could function properly—main line.

A. I wouldn't operate a line that way so I wouldn't want to state a figure.

Q. Couldn't it be stated by you?

A. Could it be stated by me?

Q. Yes.

A. I have never given it much thought and I wouldn't want to give a figure.

Q. Well, could it ever go as low as 60 per cent?

A. I have seen lines in the ground that were in 60 per cent.

The Trial Examiner: Were those lines operating, Mr. Roberts?

The Witness: Yes, sir.

Mr. Dougherty: Is that gas lines or oil lines?

The Witness: That was a gas line. It was soon repaired after I saw it, though.

By Mr. Lange:

Q. Just as a practical matter, Mr. Roberts, do you believe, for instance, if you had—say you had a 20-year ground lease on some property and at the time that about 15 years of that had expired you were making an appraisal of what that ground lease would be worth. Do you think that a prudent business man would wait until that time to spread the cost of the declining value of that lease, to the 15-year period, or start at the beginning?

A. He would probably amortize that property.

Q. And start at the beginning?

A. Yes.

Q. He wouldn't start at the 15-year period and try to take care of that decline during the remaining five years?

A. Not if it was a piece of land that he wanted to get his money back on. He would probably want to take it at uniform intervals.

Q. Over the 20 years?

A. Yes.

(Vol. XCVIII, pp. 15218-15240.)

Further Testimony of the Commission's WITNESS, HILL:

Q. State your name, please?

A. Lee M. Hill.

Q. Where do you reside, Mr. Hill?

A. Denver, Colorado.

Q. Where and by whom are you presently employed?

A. The Federal Power Commission.

Q. At the regional office in Denver?

A. Yes.

Q. And what is the nature of your occupation?

A. Associate Engineer.

Q. And how long have you been so employed by the Commission?

A. Since April 10th, 1939.

Q. April 10th, 1939?

A. Yes.

Q. Did you during the time of your employment with the Commission have any assignment in connection with the present—any portion of the present proceedings?

A. Yes, sir.

Q. That is, engineering work in connection with it, particularly the Canadian River Gas Company and the Colorado Interstate Gas Company?

A. Yes, sir.

Q. Now, before going to that, though, I will ask you whether you have before you and can read in the record your qualifications in connection with the work that you are doing with the Federal Power Commission?

A. Yes, sir.

Q. Will you do that now, Mr. Hill?

A. "My name is Lee M. Hill. I reside at Denver, Colorado. I am an engineer by profession. I have been employed by the Federal Power Commission at Denver, Colorado since April 1939. I have performed engineering duties for the Commission and am now engaged in such duties in the capacity of associate engineer.

"I entered the Alabama Polytechnic Institute in September 1921 and there studied mechanical engineering for three and one-half years. I have passed the required State examination for engineers and am licensed to practice professional engineering in the State of Alabama.

"Upon leaving the Alabama Polytechnic Institute in 1924 I was employed by W. E. Brown Engineering Company at Miami Beach, Florida as a draftsman and instrument man. My experience with this company was mostly in design and layout of water drainage and distribution systems and sanitary sewers.

"In 1925 I went to Birmingham, Alabama as a draftsman for the Sloss-Sheffield Steel and Iron Company and remained in that capacity until the early part of 1927 when I was made construction engineer. My engineering experience with this company consisted of design, construction and general maintenance of blast furnaces, by-product plants, steam power plants, power transmission systems, water transmission and distribution systems, water filtration plants, coal and ore washers, mine tipples and electrification of mine properties.

"In February 1929 I was employed by the Southern Natural Gas Corporation and later by the Southern Natural Gas Company as a mechanical draftsman and worked on plans of their natural gas pine line system, extending from the Monroe, Louisiana gas fields across t. e states of Louisiana, Mississippi, Alabama and into the state of Georgia.

"In 1930 I was made chief draftsman in charge of plans for a number of major pipe line extensions, compressing stations, measuring and regulating stations, and medium and low pressure distribution systems. In the early part of 1931 I was transferred to the operating department and there designed pipe line and compressor station extensions,

measuring and regulating stations, industrial installations, distribution systems, and all other engineering work pertaining to maintenance and operation of natural gas transmission and distribution systems.

"In 1938 I was made construction engineer and designed and constructed two additional compressing stations. I left the employment of the Southern Natural Gas Company in April 1939 and since that time have been employed by the Federal Power Commission at Denver, Colorado."

Q. Mr. Hill, I will ask you whether or not in connection with your work with the Commission you have prepared an exhibit covering the determination of composite service lives of physical properties of Canadian River—of Colorado Interstate Gas Company?

A. Yes, sir, I did.

Q. Is this the exhibit that I show you?

A. Yes, sir.

Mr. Lange: Will the stenographer please identify that?

The Trial Examiner: It will be marked for identification as Exhibit No. 177.

(Exhibit 177, Witness Hill, marked for identification.)

By Mr. Lange:

Q Mr. Hill, during what period of time since you have been employed with the Federal Power Commission have you worked on this assignment?

A. Ever since I have been with them.

Q. And that was what month and year?

A. April 1939.

Q. April 1939?

A. Yes.

Q. In connection with this work did you actually go over the property?

A. Yes, sir, I did.

Q. And personally saw the items of property that you would describe and those portions of the pipe that are underground and that you inspected at certain points along the line?

A. Well, some of the inspections I made, not all of them.

Q. Not all of them?

A. No. I did inspect all the property.

Q. You inspected the compressor stations, too?

A. Yes, sir.

Q. Now, did you in connection with this exhibit prepare—or, rather, turning to Page 1 of this exhibit, will you read that statement which was prepared by you?

(Vol. L, pp. 6957-6961.)

"This exhibit was prepared by me and under my direct supervision, and shows composite service lives, by accounts, applicable to the operative gas plant property of Colorado Interstate Gas Company as of December 31, 1939. The annual straight-line depreciation rates shown in this exhibit have been determined from the composite service lives shown therein.

"In July and August 1939 an inspection of the physical plant of the company was made by Federal Power Commission engineers. Compressing, measuring transmission, and general property was inspected. The location, type of construction, operating conditions, degree of maintenance, exposure to weather, and other factors causing deterioration, and the extent of accrued physical depreciation and of accrued obsolescence were noted for all property inspected. The age of most of the units of property was determined from dates of installation as recorded on the books of the company. Operating and maintenance methods were observed, and operating experience was discussed with company officials and supervisory employes.

"Service lives and composite service lives have been based primarily on the physical lives of the various units of property; however, consideration was given to other causes of property retirement whenever such factors were determinative. Company records, from the inception of operation, were analyzed to determine the causes of all major property retirements. These included physical deterioration, caused by wear, tear, rot, rust, decay and the action of the elements; inadequacy; obsolescence, requirements of public authorities; and other causes. Probable future conditions of operation compared with past service conditions were considered. The probable life of the natural gas supply and other factors which have a bearing on the probable service life of the property in each account

were taken into consideration. The system was considered a continuing enterprise which will operate so long as a supply of natural gas is available. The net salvage value of the physical plant of the company at retirement is considered negligible, and no salvage value has been assigned.

"In this exhibit 'adjusted book cost' represents the legitimate original cost of gas plant as shown in reports presented in this proceeding by accounting examiners of the Federal Power Commission. 'Service life,' as used in connection with this exhibit, means the period during which a particular unit of property is used or performs a useful function in the rendering of service. 'Composite service life' means the weighted average service life of all units of property within a primary account classification, determined by dividing the total capital in each primary account by the sum of the annuities applicable to the individual units.

"The general plan of presentation and methods that have been followed in this exhibit are as follows:

"Transmission Lines. The property carried under this heading includes Transmission Line Rights of way (Account 220-D), and Transmission Line Equipment (Account 226-D). Account 226-D includes cost incident to construction of the transmission lines, including labor, teaming, supervision and engineering, overheads, and other expenses, in addition to the cost of pipe, couplings, fittings, valves, and other accessory equipment.

"A total of 368 inspections was made on the main transmission line, which extends from Clayton Junction, New Mexico to Denver, Colorado, and 75 inspections were made on the various lateral or branch lines, an average of one inspection per $20,000, approximately, of investment in transmission property. These inspection locations were selected by the company, with the exception of a few additional locations which were requested by engineers for the Commission.

"Inspections were made in July and August 1939. At each location selected for inspection, a section of pipe approximately 40 inches long was cleaned. The procedure followed by the Commission's engineers at each inspection was to divide a 36-inch section of clean pipe into three

12-inch sections and take 10 or more pit measurements on each section. These pit depths and the general condition of the pipe were recorded. In addition, if the pipe was coated, the kind and condition of coating in the adjacent uncleaned sections of the pipe were recorded; notes were also made regarding type of soil, soil hydration, drainage, and description of adjacent property.

"The pipe inspection data, together with calculations relating to them, an analysis of the major retirements as shown on the company's records, an analysis of the company's records of pipe line leaks and their causes, consideration of the natural gas supply, and other pertinent information were used as guides in arriving at a service life for transmission lines.

"These data indicated that 50 years is a reasonable composite service life for all transmission lines. Corrosion has been severe, and pipe replacements relatively high on the lateral lines in the Arkansas Valley and near Denver, and the company has found it necessary to install an extensive system of cathodic protection in these areas to reduce the rate of deterioration.

"For these lines, 40 years is a reasonable service life. The same life (40 years) also was considered reasonable for the 2-inch lateral line to the Fountain Valley School, although no serious corrosion difficulty has been experienced to date on this lateral; however, it is a small-diameter line, built to supply the domestic and space-heating requirements of a single customer. However, giving consideration to the various relavant factors, the weighted average lige of both main line and laterals is nearly 50 years; therefore, this composite service life has been assigned to Transmission Line Equipment (Account 226-D), as reasonable.

"The same service life has been assigned to rights of way (Account 220-D).

"Other Transmission Structures and Equipment. Property carried under this heading includes:

"1. Land (Account 218-D) which is non-depreciable.

"2. Leaseholds (Account 219-D) has been assigned to service life of 50 years.

"3. Structures (Account 223-D), which consists of Apishapa, Delhi and Travesser Maintenance Camps, Devine Welding Shop, and a number of other structures located on the transmission system. The principal items of property were inspected. A composite service life of 30 years has been determined for this account.

"4. Equipment (Account 227-D), consists of miscellaneous materials and equipment of many descriptions. The majority of the investment represents materials and equipment with a physical life of 20 years, and this life has been adopted as reasonable for the entire account.

"Compressing *Syste*. Colorado Interstate Gas Company has three compressing stations: Clayton Station, located near Clayton, New Mexico; Canyon Station, located approximately 35 miles northeast of Trinidad, Colorado; and Devine Station, located near Pueblo, Colorado. Since all three of these stations are constructed on the same general design, have similar structures and equipment, and are operated under similar conditions, composite service lives have been determined, by accounts, applicable to all stations, these lives are as follows:

"1. Land (Account 218-C), is non-depreciable.

"2. Leaseholds (Account 219-C), has been assigned a service life of 50 years.

"3. Structures (Account 221-C) consists of main compressor buildings and auxiliary buildings. The principal items of property were inspected in the field. Type of construction, condition of property, and the degree of care used in maintaining it were observed. After giving consideration to the observed condition of this property, the company's past experience, and probable life of the company's gas supply, a composite service life of 48 years was determined for this account.

"4. Other Structures (Account 223-C) consists mostly of frame dwellings at the three compressing stations, used to house the station personnel. After giving consideration to the observed condition of this property and the company's past experience, a composite service life of 34 years was determined as reasonable for this account.

"5. Equipment (Account 224-C) consists of the main compressor units and auxiliary and appurtenant equipment and structures. The principal items of property were inspected and identified in the field. This inspection was made during the period in which main units and auxiliaries were being overhauled, so that it was possible to observe the condition of many parts which it is impossible to examine while the equipment is in operation.

"An analysis of station logs indicates that the main compressor units were operated very little during the period 1929 to 1935, inclusive, but that they have been operated more frequently during recent years. Investigation revealed that, with the exception of some dust trouble at the Clayton station and cooling water trouble at the Canyon station, little difficulty has been encountered with this equipment.

"The facts relating to compressor operation in the past, probable future operations, the probability of refirement due to obsolescence, together with the company's experience in connection with retirements for physical and functional reasons, and other pertinent information, were taken into consideration in establishing service lives.

"A composite service life of 36 years has been determined to be reasonable for this account.

"6. Other Equipment (Account 227-C), consists of miscellaneous furniture and equipment. The probable physical life of approximately half of the property carried in this account is 20 years. The weighted average service life for all property in the account was estimated to be 17 years.

"Measuring System. The property carried under this heading includes: Land (Account 218-M), which is nondepreciable; Structures (Account 222-M); Equipment (Account 225-M); and Other Equipment (Account 227-M).

"The principal items of property were identified and inspected in the field. Type of construction, condition of the property, and the degree of care used in maintaining the property were observed. All but two of these measuring station structures are similar, being Butler steel Buildings. The Denver and Pueblo measuring stations are

constructed of brick. After giving consideration to the observed condition of this property, the company's past retirements for physical and functional reasons, and the prospective future use, a composite service life of 37 years has been determined for structures (Account 222-M), and 28 years for Equipment (Account 225-M).

"Other Equipment (Account 227-M) consists of miscellaneous materials and equipment located at the Denver measuring station, the cost of a water well on the Denver measuring station site, and the payment for a one-half interest in a 3-inch water main to supply domestic water at the Denver station. A composite service life of 32 years has been determined for this account.

"General Property. The property carried under this heading is comprised of:

"1. Office Furniture and Equipment (Account 249-E) consists of furniture, office machines, and similar property. After giving consideration to the kind of property, its use, and to the company's past experience, 12½ years was determined as a reasonable composite service life of equipment in this account.

"2. Garage Equipment (Account 253-E) consists of passenger cars, pickups, trucks of various capacities, trailers, and tractors. Some of this property is more in the nature of work equipment than automotive equipment. The service lives of the different types of equipment included in this account vary with the nature of the equipment and with the character and amount of its use.

"The fairest method for determining accruals for loss in the service value of this equipment is on the basis of use. However, an accurate record of use has not been maintained. In the absence of such information, loss in service value must be based on age.

"From an analysis of the experience of the company, a composite service life of four years is determined as the reasonable composite service life for this account.

"3. Telephone System (Account 225-E) consists of telephone rights of way and telephone equipment. Telephone rights of way have been given a service life of 50 years. Telephone equipment consists of copper, copperweld, and

iron wire, together with poles, brackets, crossarms, pins, insulators, guys, and miscellaneous hardware. The entire telephone system from Clayton Junction to Denver was inspected. One pole in each mile of line was carefully inspected for checks, condition of butt, and condition of treatment. A general inspection of the condition and type of construction of the entire line was also noted. Based on the information obtained from this inspection and the company's past experience, a composite service life of 30 years was adopted for telephone equipment.

"4. Tools and Equipment (Account 256-E) consists of miscellaneous tools, and construction and maintenance equipment. The physical life of much of this equipment is affected by deterioration with time as well as with use. A composite service life of 20 years is considered reasonable for the property in this account.

"Undistributed Fixed Capital. The investment carried under this heading includes:

"1. Other Expenses During Construction (Account 203). The analysis of this account by the Commission's accounting examiners indicates that all amounts therein represent pre-construction expenditures, which are primarily expenditures for engineering service and for reports on the feasibility of the project. A period of 50 years for amortization of these costs as determined as reasonable.

"2. Law Expense During Construction (Account 262). The analysis of this account by the Commission's accounting examiners reveals that all charges included in the account represent fees incident to procuring authority to transact business in Colorado, or expenditures which may reasonably be amortized over a period of 50 years from the beginning of operations.

"3. Interest During Construction (Account 266). Taking into consideration the service life of the property to which interest during construction was applied by the company, a reasonable period of amortization for this account is 50 years.

"Property Held for Future Use. Property carried under this heading includes:

"1. Leaseholds (Account 219-C) consists of a leasehold

on which the Purgatoire River pump house is located, and a right of way for the water line from the Purgatoire River to Canyon compressing station.

"2. Structures (Account 221-F) consists of one Butler steel pump house, located on the bank of the Purgatoire River.

"3. Equipment (Account 224-28) consists of water pumping equipment in the pump house, and a 4½-inch O. D. steel water line from the Purgatoire River to the Canyon compressing station.

"All the above property was not being used at the time of inspection and was classed a property held for future use. A composite service life of 33 years was determined as reasonable for this property."

Q. Now, Mr. Hill, the succeeding sheets beginning with "Statement of Composite Service Lives Determined for Property of Colorado Interstate Gas Company," the column headed "Adjusted Book Cost, December 31, 1939," I will ask you whether those figures under that column were taken from Exhibit 139 that has been introduced in this proceeding?

A. Yes, sir, they were. They are adjusted book costs received from the Federal Power Commission Examiners.

Q. The plant account of Colorado Interstate Gas Company and these figures appear in that Exhibit 139 at Pages 49 and 50?

A. I don't have that exhibit, Mr. Lange.

Q. I show you Exhibit 139.

A. Those are the same figures shown in "Adjusted Total"—

Q. Page 49?

A. Under Column 7, yes, sir.

Q. Now, the second column headed "Service Life (Years)", are those the service life figures that were arrived at by you as explained in the written statement of this exhibit?

A. That is correct.

Q. And the third column headed "Annual Straight Line, Rate—per cent"—in other words, you then after computing the service life in years computed the percentage from that?

A. Yes, sir.

Q. In other words, where there is a 50-year service life it is computed at two per cent?

A. Yes, sir.

Q. And in like fashion right down through that third column?

A. Yes, sir.

Q. And the same on Sheet 2 of 2?

A. Yes, sir.

Q. You proceed in the same fashion?

A. Yes, sir.

Q. Now, the figures under Column 1 "Adjusted Book Cost, December 31, 1939" on Sheet 2 of 2, they were taken from Page 50 of Exhibit 139, the gas plant account of Colorado Interstate Gas Company, were they not?

A. I don't know. I don't have a copy of that exhibit.

Q. I will show you Exhibit 139.

A. Yes, sir, they are the same figures.

Q. And I believe you stated this exhibit was prepared by you or under your supervision and direction?

A. That is correct.

Q. In connection with your work on this assignment?

A. That is correct.

(Vol. I, pp. 6963-6976.)

EXHIBIT No. 177.

Statement of Composite Service Lives Determined for Property of Colorado Interstate Gas Company.

Account Number and Name	Adjusted Book Cost 12-31-39	Service Life (Years)	Annual Straight Line Rate— %
Transmission Lines.			
218-D Land	$ —	—	—
220-D Rights-of-Way	273,167.20	50	2.00
226-D Equipment	8,910,795.63	50	2.00
Total Transmission Lines	$ 9,183,962.83		
Other Transmission Structures and Equipment.			
218-D Land	$ 926.90	Non-depreciable	
219-D Leaseholds	115.50	50	2.00
223-D Structures	59,603.31	30	3.33
227-D Equipment	18,792.11	20	5.00
Total Other Structures & Equip.	$ 79,437.82		
Compressing System.			
218-C Land	$ 3,904.51	Non-depreciable	
219-C Leaseholds	523.25	50	2.00
221-C Structures	195,153.67	48	2.08
224-C Equipment	1,198,313.44	36	2.78
223-C Other Structures	188,152.60	34	2.94
227-C Other Equipment	5,320.18	17	5.88
Total Compressing System	$ 1,591,367.65		
Measuring System.			
218-M Land	$ 12,210.45	Non-depreciable	
222-M Structures	53,085.76	37	2.70
225-M Equipment	88,539.24	28	3.57
227-M Other Equipment	3,037.29	32	3.12
Total Measuring System	$ 156,872.74		

Account	Number and Name	Adjusted Book Cost 12-31-39	Service Life (Years)	Annual Straight Line Rate
	General Property.			
249-E	Office Furniture and Equipment	$ 29,108.82	12½	8.00
253-E	Garage Equipment	67,524.79	4	25.00
255	Telephone System, Rights-of-Way	1,099.11	50	2.00
255-E	Telephone System, Equipment	154,568.49	30	3.33
256-E	Tools and Equipment	33,930.69	20	5.00
	Total General Property	$ 286,231.90		
	Undistributed Fixed Capital.			
203	Entrance Rights-of-way	$ —	—	—
203	Other Expenses During Construction	36,925.61	50	2.00
262	Law Expenditures During Construction	46.00	50	2.00
266	Interest During Construction	191,901.80	50	2.00
	Total Undistributed Capital	$ 228,873.41		
	Total Investment in Gas Plant	$11,526,746.35		
	Gas Plant Held for Future Use	19,994.71	33	3.03
	Construction Work in Progress	29,677.85	—	—
	Gas Plant Adjustments	2,352,941.17		
	Total	$13,929,360.08		

[Further Testimony of WITNESS HILL.]

Q. Hardly any there. Now, what other operating or past service conditions with respect to other parts of the property were considered by you?

A. I think the equipment, the auxiliary equipment is about all. I don't think past service conditions of a pipe line can have any effect on the life of the pipe.

Q. Did you consider anything else in the inspections made at the test holes of the exposed pipe?

A. Yes, sir.

Q. What else did you consider?

A. We took into consideration the life of the field, took into consideration pipe experience of other pipe line companies and my own experience in the installation and maintenance of the steel pipe in the past.

Q. Have you finished your answer, Mr. Hill?

A. Yes, sir.

Q. Now, with respect to the life of the field, what consideration did you give to that.

A. Well, we received a figure of recoverable gas which is the same as shown in Mr. Luttring's exhibit, and I forget the number of it.

Q. It is about three and a half trillion cubic feet?

A. Something like that, at a 25-pound abandonment pressure, and we made some calculations on the bases of that figure. Do you want me to read these into the record, or do you want to look at them?

Q. Yes, go right ahead.

A. This is headed "Estimate of Remaining Life of Canadian River Gas Company reserves in Connection with Service Life Studies (all figures to nearest million Mcf.)" I didn't try to break it down. Approximate annual requirements: Mcf., at 16.4 pounds. We made estimates of the amount of withdrawals from the Canadian River acreage. These are all in Mcf.

Colorado Interstate Gas Company, Denver Line, 22,000,000; Chicago Line—that is the present Chicago line—22,000,000. We took into consideration the second Chicago line at the time we determined these service lives. It looked possible that that line might be built and so we took it into consideration and then estimated that the Canadian River would furnish half of the present gas that they were furnishing to the Chicago line, which would be 11,000,000.

Q. That's 50 per cent increase?

A. Yes, that's right—which totaled 55,000,000. Understand all these figures are Mcf.

Q. Yes.

A. The Amarillo Oil Company and Clayton Gas Company, 7,000,000; Company use, 1,000,000, which is somewhat high; a total at 16.4 pounds base pressure of 63,000,000.

Mr. Spencer: Annual figures, you are talking about?

The Witness: These are all annual figures.

Total of 14.65—we converted to 14.65—71,000,000. Reserves at end of 1939 (25 pounds abandonment) was 3,636,000,000 Mcf. at 14.65 pound base pressure. Now, that figure was the same figure as used by Mr. Luttring and furnished to us by the Federal Power Commission geologists. The remaining life of the field from 1939, figured on that basis, amounted to 51 years. The expired life from 1928 to 1939, eleven years, or a total life from 1928 of 62 years. Now, that was all figured on a 25-pound abandonment pressure and another increase we made on this thing, and this increase was made of 15 per cent to allow for stimulation, and this allowance was made for stimulation due to rate reductions, voluntary or otherwise.

Percentage increase (15 per cent) is a judgment figure, based on results obtained on Denver line after reduction in space heating rates in 1934, and giving consideration to saturation of the load.

By Mr. Dougherty:

Q. That's sales you are talking about, the 15 per cent?

A. That's right. We have added 15 per cent on the figures which are as follows: Denver line, 25,000,000; Chicago line, present line, 25,000,000; Chicago line, second one, half of the present load, 13,000,000—63,000,000; Amarillo Oil Company and Clayton Gas Company, 8,000,000; company use, 1,000,000; total at 16.4 pounds base pressure, 72,000,000; total at 14.65, 81,000,000.

Taking this 81,000,000 into the previous figure that was furnished to us by the geologists gives a life of that field of 56 years. We came to the conclusion that the life of that field would be approximately 56 to 62 years.

Q. That is from the initial operation of the company? That is the date you are taking the number of years from—1928?

A. That is right, from 1928.

Denver-Chicago—two lines—and Amarillo, would be 56 to 62 years.

Q. What consideration, if any, did you give to drainage that might be taking place in that field, whereby the field life would be depleted because of other withdrawals from the field earlier than would be indicated from your figures—

A. I think you are getting outside of my field a little bit, Mr. Dougherty. I am not a geologist.

Q. What I want to do is to get the limitations within which you did take these—I take it you assumed that the volume of gas which Canadian River was estimated to have by the geological department would all be produced by Canadian River and available for sale down to the 25-pound rock pressure?

A. Well, if you want my opinion. This is my opinion on the thing.

Q. First I am asking you if that is what you did. I am trying to find exactly what you did.

A. Read the question.

(The question referred to was read by the reporter, as set forth above.)

By Mr. Dougherty:

Q. That was the assumption on which you proceeded?

A. Yes, sir, that was the assumption I made and it is my opinion that the Canadian River will, if there is any gas drainage away from the Canadian River, they will drain from other leases. That is the only thing that I can see.

Q. Well, now, are you familiar with the location of their acreage so that you know from what leases that drainage might take place to Canadian River?

A. Well, you are still getting off my line.

Q. Well, you started on the line here giving your voluntary opinion which first you said you weren't qualified to give, so I wanted to ask you the basis of it.

A. I am familiar with the location of Canadian River

Q. The gas won't drain both ways at the same time in the same strata?

A. I don't think so.

Q. No more than water will run two ways in the same pipe; so drainage takes place from the high pressure area to the low pressure areas?

A. Yes, sir. It is logical to assume that.

Q. And you know that the extreme western part of the field is the high pressure area where Canadian River's leases are located?

A. Well, I have been told that. I don't know.

Q. Well, then, your expression of opinion that what Canadian River will lose by drainage they will gain by drainage some place else was pretty much of a guess, wasn't it?

A. That's all, on my part, yes. As I say, I have made no study of that field.

Q. Of course, if drainage takes place it couldn't be true that all leases will get as much as they lose, otherwise everybody would be coming out even?

A. I couldn't say that. I don't know.

Q. Well, on the assumption that there would be drainage from Canadian River to other leases which would not be compensated for by drainage from other areas to Canadian River, would not that change your computation as to the amount of recoverable gas which is available from those leases?

A. Well, I have made no computation on the amount of gas. I have taken this figure from the geologists. I have made no computation of the amount of gas.

Q. You made a computation of the amount of gas that could be taken out of the wells and sold; that is, you have got your figures there.

A. Not for the reserves under Canadian River acreage.

Q. Your figures are production figures which you said—

A. I estimated what I thought the Colorado Interstate Gas Company—or the Canadian River Gas Company, their requirements would be, taking these things into consideration. That's all I have done. It is merely an estimate on my part.

Q. Your figures, then, that you have given, is that in a period of 56 to 62 years from 1928 Canadian River and Colo-

rado Interstate would have to have available the quantities of gas which is the total that you arrive at?

A. That is right. That is true.

Q. If they stay in business that long.

A. According to my calculations, yes, sir. As far as the life of the field goes, the supply of gas, I don't know anything about that.

Q. Well, now, any change in the character of operation or anything that takes place in the future, that would serve to revise the figure which was given as the amount of gas reserves there, that would, of course, then, have affect on your computations?

A. Yes, sir, and there are other things that would have affect on my computations—the possibility of the second Chicago line not being built would have a tendency to increase the life of that field. The Denver line deliveries take precedence over Chicago. The possible reduction in the Chicago line to take care of the Denver line would increase the life of the field. The possibility of the Chicago line taking gas from the Hugoton field would have a tendency to prolong the life of the Panhandle field and also prolong the life of Canadian River property.

Q. Well, now, when your speak of the Canadian River acreage, you are just talking about that in the Panhandle field?

A. Yes, sir.

Q. You think these possibilities are things which may not take place in the future?

A. These things I speak of are things that have been taken into consideration in determining service lives on this property.

Q. To what extent did you take into consideration the Hugoton field in determining the service lives of this pipe of—

A. If the life of the field had been the determining factor in the service lives that I set on this line it would have been taken into consideration. That's the whole thing. I think the life of the field will be longer than the service life that I have set on this property.

Q. I take it, then, that your figures of service lives here are purely service lives based on physical factors?

A. Primarily. I have written in this written statement that it is primarily based on physical life.

Q. Your have neither increased the service lives nor decreased them because of any consideration of availability of gas?

A. Yes.

Q. Which did you do?

A. I decreased them.

Q. You recognize, I take it, that service life for the purpose of accruing depreciation should be less than the number of years the gas supply will be available?

A. Yes, sir, that is the reason I made these calculations.

Q. Now, you apparently, therefore, considered that anywhere from six to ten years of additional life beyond the 50 years for the main line pipe, for example, would be adequate period of time to balance off any replacements that had to be made prior to the expiration of the 50 years?

A. Yes, sir. There is some of that pipe line this I have no doubt that it would live a hundred years. Some may be less than a hundred years. Fifty years is what I have set on it as the average life.

Q. Of course, Mr. Hill, one hundred years will do no good in accruing depreciation reserves?

A. That is true.

Q. If the economic life of the property is sixty?

A. That is right. That is the reason these lives have been cut back.

Q. So I say, you recognize that it is necessary to recover the original cost by the end of sixty years if that is the economic life of the project?

A. Yes, sir.

Q. In doing that you have taken 50 years for the pipe on the assumption that such number of years as the property operates beyond that will adequately provide full depreciation reserve?

A. Yes, sir.

Q. Now, any installation of compressors, for example, which you have given—I think 36 years, haven't you?

A. Yes, sir.

Q. Any installation of compressors in the latter part of this 60 years would present a different problem of service lives for the purpose of accruing depreciation?

A. I think it would, yes, sir.

Q. That is, you recognize that limitation of field life is a very positive and determining factor in your service lives?

A. I think it is, yes, sir, although I think those compressor engines will last much longer than the composite life I have used—

Q. Well, we will know that when the 36 years is over.

When you use the phrase, then, in your text that the system was considered a continuing enterprise which will operate so long as the supply of natural gas is available, that statement refers to the answers you have just given of the life from 56 to 62 years?

A. Yes, sir.

Q. If in the future that field life basis were changed, then the service lives which you have given here might be revised either up or down depending upon what the change of conditions was, I take it?

A. I think so.

Q. Now, when you made your inspection of your pipe lines, your main pipe lines, you took down notations on pit depths and general conditions, and so on, and the other information that you relate on Page 3 of Exhibit 177. How did you translate that into your final answer of fifty years? What did you do?

A. I didn't translate that into the final answer of fifty years.

(Vol. LI, pp. 7015-7026.)

* * * * *

Q. Mr. Hill, if I recall, during the course of my cross examination of you, you testified that the life of the main pipe lines and transmission lines was based upon the life of the field, or the life of the natural resources, rather than the physical life of the pipe, isn't that correct?

A. Yes, sir.

Q. That was my understanding.

A. Yes, sir.

Q. Now, you got the figure upon which you calculate the life of the field from Mr. Hammer?

A. Yes, sir.

Q. I don't recall just where that is in your written statement. Do you have it in there?

A. I think I have it in here some place, Mr. Spencer.
Q. Will you please identify it if it is there?
A. I used 3,636,000,000 Mcf., that is at 14.65.

Mr. Lange: 14.65 pounds?

The Witness: Yes, sir.

Mr. Lange: At what time?

The Witness: That was as of the end of 1939.

By Mr. Spencer:

Q. Is it in here any place? I can't find it.
A. No, it is not.
Q. You just testified to it?
A. Yes. I had this tabulation here.
Q. That's all right, and that is the same figure that appears in Mr. Hammer's exhibit number—

Mr. Lange: I think it is 180.

Mr. Spencer: 180?

The Witness: Well, I don't know. I haven't looked at Mr. Hammer's exhibit.

By Mr. Spencer:

Q. All right. The record will show. I believe you also testified that the life of Canadian River Gas Company's reserves as computed by you was based upon the assumption that Canadian River would recover all of the gas included in the figure which you obtained from Mr. Hammer.

Mr. March: I object to that question. He has not made a computation of the reserves of the Panhandle field.

Mr. Spencer: It doesn't make any difference.

Mr. March: The exhibit does not—I believe you mistook yourself there, Mr. Spencer.

The Trial Examiner: Read the question.

(The question referred to was read by the reporter as set forth above.)

Mr. March: The question is thoroughly improper. He has not made any computation of gas reserves at all.

Mr. Spencer: No, the life of the reserves.

Mr. March: He has made no computation of the life of the reserves in this exhibit at all. He hasn't had a thing to do with the life of the reserves. He is talking about the life of the pipe line.

By Mr. Spencer:

Q. Haven't you computed the life of the natural resources that are available to Canadian River Gas Company, Mr. Hill?

A. I have used these figures that have been furnished to me as far as determining service life of this property.

Q. And you went at length to show me how you computed it on different bases?

A. Yes, sir.

Q. Now, those calculations and computations which you made are based upon the assumption, then, that Canadian River Gas Company would recover every foot of gas indicated in the reserve figure that was handed to you by Mr. Hammer?

A. Yes, sir, that is the way I have used it.

Mr. Spencer: All right, that is all.

The Trial Examiner: Is that all, Mr. Spencer?

Mr. Spencer: Yes, sir.

Redirect Examination.

By Mr. Langé:

Q. In other words, you utilized the reserve figures that were given to you by Mr. Hammer?

A. Yes, sir, in determining service lives.

Q. You didn't attempt to compute any reserves yourself?

A. No, sir, I have not.

(Vol. LXIV, pp. 9258-9261.)

Further Testimony of the Company's Witness, Solo.

Q. There is a letter addressed to one of the employes. Did you write that letter?

A. Yes, sir.

Q. Yourself?

A. I dictated it. In fact, Mr. Smith and I dictated it jointly. All we did—this exhibit was prepared, as I have testified, under our direction. When it came to the value of these fee lands we used the appraisals that the company had already secured on those lands made by real estate agents and other independent appraisers at different times near where these lands were located. In instructing them how to set up the exhibits we told them to use the appraisals they already had and that is what the letter says.

Q. I notice here at the end of that letter, Page 17 of it, there is the calculation: "Five per cent in 1947 and 1955;" then you have up here figures that refer to 1947. What is the significance of that?

A. When we originally planned to make this study the officials of the gas company asked us to make a study of the salvage value at two years instead of at one and after we started, but before we had really done very much work on the joint study, after further discussion with them we decided not to make an appraisal of the two years and finally made an appraisal as of January 1, 1956.

(Vol. XCVII, pp. 14941-14942.)

* * * * *

Q. Now, I notice down here in about the middle of the page on Page 4 you strike out "As of December 31, 1947."

A. Well, you see when this statement was originally prepared it was going to be a double statement showing salvage values; first, as of December 31, 1947 and then December 31, 1956. When we finally determined to make only one study, I went through the preliminary papers and changed them all to read just for the one period.

Q. Who told you to make only one study?

A. Who told me?

Q. Yes.

A. The attorneys of the Colorado Interstate Gas Company and the Canadian River Gas Company.

Q. Who? Mr. Brock?

A. Mr. Brock was one of them.

Q. Who else?

A. Well, I believe Mr. Hendee was present at that conference and possibly Mr. Dougherty.

Q. All right. I notice here on Page 5 you strike out:

"Ranging in age from 17 years." Why did you strike out 17 years?

A. For the same reason, because in 1947 material would be 17 years old and in 1956 it would be 25 years old. In dictating this statement in contemplating the double statement, we said "ranging from 17 to 25 years," but when we found it was only to be a final statement, we took the ranging out and had an absolute period and had the 25 years.

Q. In the sentence: "* * * no responsible organization would undertake the initiation of a new project with materials ranging in age from 17 to 25 years," you struck out "ranging in age from 17."

A. I think either statement is correct. I think it would be just as difficult for a company starting a new project to buy material 18 years old as 25 years old. It just wasn't necessary to say it under the circumstances.

(Vol. XCVII, pp. 14946-14947.)

* * * * *

Q. Who employed you specifically?

A. As to my employment in this case, Mr. Taubman called me about eight or ten months ago and told me that Mr. Moody, one of the officials, I believe, of one of these companies, asked him as a courtesy if we would again testify in this case as we testified in the Texoma case, and that most of the material was in a similar area; so at Mr. Taubman's request I went with him to Amarillo about last May, I believe, and at that time we met a number of attorneys and officials of the company, including Mr. Hendee, I believe, was there, and they asked us to testify in this case and we said we would.

Q. Are you getting some of your money from Canadian River Gas Company and some of it from Colorado Interstate Gas Company, do you understand?

A. I don't know. I haven't discussed money with these people at all in any shape, form or manner.

Q. How many days were you on the stand in the Texoma case?

A. I think I was on the stand about three-quarters of a day during the original trial and I went back then to Washington some weeks later and was on the stand for an additional thirty minutes, something like that.

Mr. March: I request that that information be furnished the record as to how much he is being paid.

Mr. Dougherty: All right.

Mr. March: You won't be on the stand quite that long this time. That's all.

The Trial Examiner: May I ask Mr. Solow a question, Mr. Dougherty?

The Witness: Yes.

The Trial Examiner: Mr. Solow, why did you fix the date of 1950 as the determination of the salvage date?

The Witness: That figure is purely an arbitrary date that was given to me by the attorneys of the company. That is the date they said they wanted this study to cover.

The Trial Examiner: I think that's all.

(Vol. XCVII, pp. 14949-14951.)

Further Testimony of the Company's Witness, W. D. Smith.

Q. What is your understanding as to why they cut out all reference to 1947?

A. When we first went to Colorado Springs we were told to make two salvage estimates, one as of 1947 and one at a later time, being in 1955, I think it was, as shown here. Before we got very far into the work we decided to talk to Mr. Brock and see whether or not that was what he wanted. We came up to Denver and Mr. Solow and myself talked to Mr. Brock and Mr. Hendee. They fixed the dates wherein these exhibits were prepared.

Q. The original plan was to have the figures for 1947?

A. Yes, that was the way we started it.

Q. You haven't seen any of the subsequent instructions which are revisions of the first instructions?

A. Yes, I have a book here of my own with the instructions in it.

Q. This book of yours contains letters, as I notice here, prior to—it looks to me like those letters were in connection with the Texoma case. I see one here dated June 10, 1939.

A. Some were used in the Texoma case.

Q. June 17, 1939, also?

A. Yes.

Q. You testified in the Texoma case, did you not?

A. Yes.

Q. What was the period of salvage? What was the time of salvaging that property?

A. January 1, 1954 as I recall it. That is to the best of my memory.

(Vol. XCVII, pp. 14986-14987.)

---

28. Necessary Rate of Return.

Paul B. Coffman, a witness for the respondent, testified on rate of return (Exhibit 73, Vol. XV, p. 2103).

He graduated from the Ohio State University in 1923 with the degree of B. S., and from Harvard University Graduate School of Business Administration in 1926 with the degree of M. B. A. He is now Vice President of Standard Statistics Company, Inc.

From 1926 to 1927 he was Professor of Economics at William and Mary College, and from 1927 to 1936 Professor of Accounting and Business Policy at the Graduate School of Business Administration at Harvard University, and at the same time was Consulting Economist for a number of industrial corporations and financial advisory institutions.

During 1931 and 1932 he was Executive Vice President and General Manager of Poor's Publishing Company engaged among other things in publishing Poor's Manual.

From 1935 to 1939 he was Departmental Manager of Standard Statistics, having charge of statistical and research investigation and valuations, since which time he has been Vice President of Standard Statistics directly in charge of statistical and economic research and valuations for individuals, institutional and (p. 2104) corporate clients. In connection with his duties he has been constantly engaged in the examination and analysis of securities and corporations, with the view of determining hazards involved, and the intrinsic worth of securities, and the presentation of such findings to the many clients of Standard Statistics.

In October, 1940, his company was retained by the Colorado Interstate to make a statistical study for the years 1937, 1938 and 1939, and for the interim period of 1940, January-October, of the investors' appraisal of the risks of capital invested in the natural gas business as compared with the risks of capital invested in other utilities. His analysis covered the following utility classifications: (1) electric utility operating companies; (2) water companies; (3) manufactured and mixed gas companies, and (4) natural gas companies.

The telephone industry was excluded, because it was so largely dominated by the American Telephone and Telegraph (p. 2105) company. In most cases complete data, particularly with respect to market prices on the quoted securities of the operating subsidiaries, were not obtainable.

His method of procedure as to each group, and also as to each utility in the several groups for each of the periods 1937 to 1939 inclusive, and the interim period of 1940, January-October inclusive was:

His first step was to ascertain the total market value of all securities of each company at the end of each year by the average of its high and low market quotations in the year (p. 2106).

The second step was to determine for each company the total earnings available for distribution to the security holders after taxes, depreciation and other miscellaneous charges, as reported by the particular company to its stockholders (p. 2107). For the years 1937, 1938 and 1939 the earnings were taken as shown in the published reports. For the interim period in 1940 the latest reported earnings, covering a twelve months' period, were used.

The third step was to divide the earnings by the indicated market value, which gave the rate for the period in question (p. 2108).

The fourth step was to make the necessary calculation to show the market value of all of the securities in the group, and likewise to show the total earnings available for distribution to the securities of all companies in the group. The latter figure was then divided by the former in order

to obtain the investors' overall appraisal of the risk of all capital in the group (p. 2109).

As to electric utility operating companies, he first listed all such companies upon which Standard Statistics currently publishes data in Standard Earnings Bulletin. The list included fourteen companies, which were the more important operating utility companies in which there was any investment interest. From this list there were excluded all corporations whose operations were not predominantly in the electric field. The resulting list included the following companies:

Boston Edison Company.

Commonwealth Edison Company.

Consolidated Edison Company of New York.

Consolidated Gas Electric Light & Power Company of Baltimore (p. 2111)

Detroit Edison Company.

Pacific Gas & Electric Company.

Southern California Edison Company, Ltd. (p. 2112)

He took the list of all operating companies engaged solely in the water business which he could find from Standard Corporation Records. From this list certain companies were eliminated for the following reasons:

1. Companies whose common stocks were held by one of the larger holding companies, and which had no obtainable market evaluation.

2. Companies whose stocks were closely held by relatively few individuals and had no available market evaluation.

3. Companies whose 1939 gross operating revenues were (p. 2113) less than $500,000.

The following companies remained on the list:

Bridgeport Hydraulic Company

Elizabethtown Water Company Cons.

Hackensack Water Company

Middlesex Water Company

New Haven Water Company

Plainfield-Union Water Company

Stamford Water Company (p. 2114)

As to manufactured and mixed gas companies, a list was prepared of all operating companies distributing manufactured or mixed gas, and listed in Standard Corporation Records. From this list certain companies were eliminated for the following reasons:

1. Companies which did not have stocks outstanding in the hands of the public and for which there was no market evaluation.

2. Companies whose gross revenue was predominantly obtained from services other than distribution of manufactuerd and/or mixed gas.

3. Companies which were in receivership at the end of 1939.

4. Companies with gross revenues in 1939 of less than $1,000,000.

With these eliminations the following companies remained:

Bridgeport Gas Light Company

Brooklyn Union Gas Company

Elizabethtown Consolidated Gas Company

Hartford Gas Company

Laclede Gas Light

Peoples Gas Light & Coke Company (p. 2116)

Providence Gas Company

Seattle Gas Company

Springfield Gas Light Company

Washington Gas Light Company (p. 2117)

With reference to natural gas companies a list was prepared of all operating and holding companies engaged in

any phase of the natural gas business. From this list he eliminated:

1. Companies which had no stocks outstanding in the hands of the public.

2. Companies which were not exclusively engaged in the natural gas business.

3. Companies in receivership at the end of 1939.

After such eliminations the following companies remained:

Duquesne Natural Gas Company
El Paso Natural Gas Company
Houston Natural Gas Corporation
Interstate Natural Gas Company
Lone Star Gas Corporation (p. 2118)
Memphis Natural Gas Company
Mountain Fuel Supply Company
National Fuel Gas Company
Northern Oklahoma Gas Company
Northern Utilities Company
Oklahoma Natural Gas Company
Pacific Lighting Corporation
Southern Natural Gas Company (p. 2119)

Included in the above group of natural gas companies was the Pacific Lighting Corporation. This company through subsidiaries distributes natural gas to 272 cities and towns in California, including Los Angeles. Its subsidiaries serve about half the population of the state. Market prices of the securities of the operating companies are not available, in view of which this holding company was treated as a single operating company in the above group. As a result, its indicated market value is nearly 40% of that of the entire group of natural gas companies, thus giving entirely too much weight in this group to a purely distributing company. This company owns no gas producing facilities, and does not run any of the risks of producing and trans-

portation (p. 2120). For these reasons the risks of capital employed in this company more nearly approximate those of strictly distributing companies serving manufactured or mixed gas.

The comparison as worked out under the formula above described is as follows:

"Comparison of Investors' Appraisal of Risks of Capital in Pacific Lighting Corporation as Compared with the Manufactured and Mixed Gas Companies Group.

	Per Cent 1937	Per Cent 1938	Per Cent 1939	Per Cent Three Yr. Average	Per Cent Jan.-Oct. 1940
Pacific Lighting Corporation	7.20	7.35	6.26	6.94	5.42
Manufactured and Mixed Gas Companies Group	6.22	6.52	6.56	6.43	6.98"

In the following table all figures for the Pacific Lighting Corporation are eliminated, and with this elimination the figures for the twelve natural gas companies remaining in the groups are as follows: (p. 2121)

"Determination of the Investors' Appraisal of the Risks of Capital for Natural Gas Companies (Excluding Pacific Lighting Corporation).

	1937	1938	1939	Jan.-Oct. 1940
Total Indicated Market Value of Capital	$294,414,969	$263,667,801	$275,217,638	$278,359,660
Total Earnings Available for Indicated Capital	24,488,305	21,213,539	22,902,944	25,529,032
Investors' Appraisal of Risks of Capital	8.32%	8.05%	8.32%	9.17%" (p. 2122.)

The summary in percentage, including Pacific Lighting Corporation and excluding that company, is shown in the following table for the years 1937 to 1939 inclusive, and the interim period of 1940:

"Investors' Appraisal of Capital Risk in Various Divisions of the Utility Business.

	Per Cent 1937	Per Cent 1938	Per Cent 1939	Per Cent Three Yr. Average	Per Cent Jan.-Oct. 1940
Electricity Utility Operating Companies	5.47	5.50	5.41	5.46	5.42
Water Companies	5.52	5.39	5.66	5.52	5.17
Manufactured and Mixed Gas Companies	6.22	6.52	6.56	6.43	6.98
All Natural Gas Companies	7.91	7.79	7.53	7.74	7.77
All Natural Gas Companies Excluding Pacific Lighting Corporation	8.32	8.05	8.32	8.23	9.17" (p. 2124)

William Chase Gilman, a witness for respondent, testified on rate of return (Exhibit 74, Vol. XVI, p. 2256).

He graduated from the Massachusetts Institute of Technology with degree of Bachelor of Science in 1922 and received the degree of Master of Science in Electrical Engineering in 1923. He is a professional engineer in the State of New York.

From 1923 to 1925 he was engineer for the General Electric Company; from 1925 to 1927, Manager Lighting Division, Commercial Department, Central Hudson Gas and Electric Corporation; 1928, Engineer Carolina Power and Light Company; 1928 to 1935, Engineer in the Treasurer's office of the Equitable Life Assurance Society; 1935 to 1937, Director of Public Utilities Division Securities and Exchange Commission; 1937 to date, partner in Gilman & Hickey, Financial Consultants, New York (p. 2258).

During the seven years he was with the Equitable, it was his duty and responsibility to recommend to the Treasurer for purchase by the Society of public utility and industrial securities. The Equitable is among the very large insurance companies of the country and purchases many millions of dollars of such securities each year. In this connection he visited the properties and investigated the operations and analyzed the securities of a large majority of the electric and gas companies of importance having securities out-

standing in the hands of the public. As a part of such analysis the question of rate of return was involved.

During this seven year period the investment of the Society in securities in the field for which he was responsible, increased from approximately $110,000,000 to $262,000,000.

During the early period of that employment the Equitable made no purchases of natural gas pipe line securities. During the latter part of the period he began making studies of the industry; and in (p. 2259) 1935 the Equitable purchased $4,000,000 of an issue of $16,000,000 bonds of the Northern Natural Gas Company. The remainder of the issue was sold to other large insurance companies, and this was the first large purchase of bonds of a natural gas pipe line company by institutional buyers, except for two relatively small blocks of bonds of subsidiaries of Columbia Gas and Electric Corporation bought a year previously by the Metropolitan and the Mutual Life Insurance Companies.

In 1935 he resigned from the Equitable to join the staff of the Securities and Exchange Commission in Washington, and took part in the organization of the Public Utilities Division. Shortly thereafter he became the first Director of that Division. In that position he was responsible for the administration of the Holding Company Act (p. 2260). The staff had the responsibility under his direction to analyze the various applications filed by registered holding companies and their subsidiaries with reference to issuance of securities, and to prepare recommendations to the Commission.

During the past three years his firm has been engaged in work of a financial consultation nature, chiefly in the utility field (p. 2261). Their clients consist of financial institutions, investment trusts, underwriting houses, legal firms, and utility operating and holding companies. His firm had experience in appraising stock of dissenting stockholders in a statutory consolidation, and in making special investigations and reports for insurance companies, and in making studies and giving testimony as to the value of utility property (p. 2262).

He had inspected properties of the Colorado Interstate and had discussed certain phases of its business and opera-

tion with company officials. From his previous work with the Equitable he has for a number of years been familiar with the business and operations of the Public Service Company. He had examined the statements and all financial data of the Colorado Interstate through the full year 1939 (p. 2263) and has examined copies of exhibits already introduced in this case (p. 2264).

No single standard can be set up as to what constitutes a fair rate of return. The facts in each case, the currently prevailing conditions, the degree of risk, the current cost of money and similar factors must be considered. The return should be sufficient to maintain the credit of the utility and to attract capital, and should be equal to that generally being made at the same time in the same region on investments in other enterprises which have corresponding risks. Consideration should be given also to the financial history of the utility and its historical cost of capital.

He considered the language of the Supreme Court in the Bluefield Case as a good guide of what constitutes a fair rate of return (p. 2265).

Investors will invest in a regulated industry only when they feel that there is a combination of return and safety which is at least as high as they can obtain in other fields. Public utilities and other regulated enterprises are in competition for the investor's dollars against all other businesses (p. 2266).

After describing the property, operations and business of Colorado Interstate (pp. 2268-69), he stated that this company is entirely unlike the ordinary public utility company, such as a water, electric or telephone company, as they are relatively permanent in character, and have no problem comparable to that involved in the natural gas industry, namely, that they may find themselves suddenly without the supply of their product.

Neither are manufactured gas companies comparable to any extent that is helpful. They, too, are able to continue the manufacture of gas over an indefinite period, and are not dependent upon a wasting natural resource (p. 2270).

There is an important distinction between a natural gas

company having a completely integrated business and a natural gas pipe line company. A natural gas company having an integrated business, that is, one which owns or controls the distribution in addition to production and transmission, generally speaking, is a less risky enterprise than the pipe line company which owns only production and transmission facilities and sells its gas at wholesale to distributors who control the market.

He was unable to find other business or companies having securities outstanding in the hands of the public which have risks and uncertainties precisely corresponding to Colorado Interstate. The business of companies affording the closest comparison to risks and uncertainties are other natural gas pipe line companies (p. 2271).

Since the Bluefield decision, the public utility industry has grown much larger, and has become too large to be financed almost wholly with local capital. Accordingly, securities of the large public utilities and industrials have been sold throughout every state in the United States. In addition, improved methods of transmission and dissemination of information, and the largely increased amount of data generally available to investors, has made it easy for investors in every part of the country to have up-to-date information. For these reasons, any business needing a substantial amount of capital will usually secure it in a national money (p. 2272) market, or at least is not limited to the locality in which it operates.

In Appendix 1 to Exhibit 74, there is shown a list of natural gas companies which are engaged in the purchase or production, or both, transmission and sale of natural gas, which have annual gross operating revenue of $2,000,000 or more, and which have common stock outstanding in the hands of the public. Natural gas companies owning large amounts of distribution facilities have not been included in the list for the reason that such companies are less directly comparable. The five companies listed in the Appendix are comparable to Colorado Interstate to some extent, in that they all (1) purchase or produce natural gas in producing areas; (2) transmit it a substantial distance by means of large pipe lines; (3) sell gas to industrial customers or to distributing companies for resale (p. 2273).

These five companies are:

El Paso Natural Gas Company

Interstate Natural Gas Company

Memphis Natural Gas Company

Panhandle Eastern Pipe Line Company

Southern Natural Gas Company

and statistics are given with respect to each of these companies.

Since 1935 there has been sold to the general public and to institutional investors, publicly and through private sales, substantial amounts of first mortgage bonds of companies engaged in the natural gas pipe line business. Generally speaking, the size of the mortgage bond issue has been modest in proportion to the property account and the maturities have not been in excess of fifteen years, with heavy sinking funds provided, sufficient to amortize the total bond issue over its life. In practically all cases the life of the supply has been estimated by independent geologists to be longer than the maximum maturity of the bonds.

In recent years there have been no substantial sales of preferred stock of natural gas pipe line companies, and in his opinion such security is not suited to natural gas pipe line companies. There have been no substantial sales to the public of (p. 2274) common stocks of natural gas pipe line companies in recent years (p. 2275).

From the statistics shown in Appendix 1 he pointed out that the earnings price ratios for those companies range from 6.75% to 18.75%, indicating the investors' appraisal of the common stock of natural gas pipe line companies (p. 2276).

The future of the company is somewhat uncertain. Its contracts with its largest customer, Public Service Company of Colorado, and subsidiaries, from which it derives approximately 48% of its revenues from gas sales, expire in 1948 and 1949 (p. 2277).

Under today's conditions a company such as Colorado Interstate could normally be most economically financed

through the issue and sale of bonds to the extent of 50% of the amount of capital required and the balance of 50% through the issue and sale of common stock. With the existing uncertainity as to the renewal of the contracts expiring in 1948, the maturity of the bonds would of necessity be prior to 1948.

Colorado Interstate's bonds outstanding bear interest at 2¾% and mature December 1, 1945. The cost of bond money to the company, including the expenses of issue, would be approximately 3%.

From his knowledge of investor requirements and his study of the market's appraisal of other natural gas pipe line companies' securities, it was his opinion that the common stock equity money could be obtained from investors on approximately an 11% to 12% basis. Taking into consideration the expenses of issuance, the (p. 2278) cost to the company of the equity portion would be at least a 13% basis.

On the basis of a capitalization of 50% bonds at 3%, and 50% common at 13%, the resulting cost of money would be 8%, and accordingly it was his opinion that the rate of return on the fair value of the property necessary to attract investors to put up the necessary funds is 8% (p. 2279).

Herbert S. Sands, a witness for the respondent, testified on rate of return (Exhibit 92, Vol. XIX, p. 2653).

He is a graduate of the University of Colorado, with a degree of Electrical Engineer. He entered the student course of the Edison General Electric Company at Schenectady, New York, in 1889, and completed the course in 1893. He became erecting engineer for the company, and later superintendent of construction, 1894 to 1898.

He was construction engineer and superintendent of the Colorado Springs and Cripple Creek District Railway (p. 2653), 1898 to 1899.

Was superintendent of construction and later superintendent of operation of the La Bella Water and Power Company at Goldfield, Colorado, 1899 to 1901.

He was construction engineer and superintendent of the Seaton Mountain Light, Heat and Power Company at Idaho Springs, Colorado, 1901 to 1905.

Later he was manager of the industrial division of the intermountain territory of the Westinghouse Electric and Manufacturing Company, in connection with which he had charge of industrial engineering, which involved consulting on most of the large industrial developments of the intermountain region (p. 2654).

Has been an independent consulting engineer since 1927, involving rate analysis and design of electric rates for the Home Gas and Electric Company at Greeley, Colorado; Glenwood Springs, Colorado; municipal plant at Oak Creek, Colorado; Arvada Electric (p. 2655) Company, Arvada, Colorado; Colorado Central Power Company at Englewood, Colorado; gas rates for the Cheyenne Light, Heat and Power Company, electric rates at Fort Collins, and gas, electric and water rates for the City of Denver.

He has been engaged in the inventory and appraisal of utilities and industrial plants, including the Public Service Company of Colorado, Glenwood Light and Water Company, Colorado Central Power Company, Colorado Utilities Corporation, Home Gas and Electric Company, Arvada Electric Company, Mountain Utilities Corporation (p. 1656), Western Public Service Company, Central Power Company, Redlands Irrigation and Power Company.

He has also been engineering advisor to the legal staff of the Nebraska Power Company, Western Public Service Company, Nebraska-Iowa Power Company, Central Power Company, and Northwestern Public Service Company.

He has acted as officer of the Federal District Court in the appraisal of the property of the Colorado Fuel and Iron Corporation in reorganization.

He has made an appraisal of the Colorado & Wyoming Railway, and has been consulting electrical engineer for the four upper basin states of the Colorado River, and engineering advisor for the seven railroads in Colorado.

He has been chairman of the State Board of Engineer Examiners of Colorado.

He is registered as an Electrical Engineer in the state of Colorado.

He is a member of the American Institute of Electrical Engineers, and was Vice President 1923-24 (p. 2658).

In considering the rate of return for Colorado Interstate he gave consideration to the territory to be served, describing in some detail the property of Colorado Interstate, the principal cities and their growth of population, and the industries, showing that the entire area is progressing and developing, and that the load is diversified (pp. 2659-62).

He considered the fact that the natural gas industry is an extractive industry, and that the supply is continually being depleted, and that the integrity of the investment is entirely dependent upon the estimate of geologists. He took into consideration the fact that an adequte supply of gas had been available for twelve years, and from all indications the supply is still adequate (p. 2663). He considered the fact that in addition to Canadian River there were five additional gas companies taking gas from the Amarillo Field in considerable quantities, and there is a possible hazard of other companies adding to the depletion of the field (p. 2664).

He considered the fact that regulation necessitates changes in methods and is attended by expense of hearings, and in the case of increased operating expenses and decreasing earnings the company can resort to the Commission for adjustment. Nevertheless, there is always a lag between the ascending price of commodities, labor and taxes, and the relief afforded.

He considered the fact that 21% of the total gas sold is sold under contracts expiring in 1943, 49% in 1946, and 28% in 1948; also, that increased demands on the pipe line will increase the operating expenses of the compressor stations. Taxes have increased from 1.38 cents per Mcf. in 1930 to 2.10 cents in 1939 (p. 2666).

The Colorado Interstate has no control over the market which is served through resale companies, and must rely on the vigilance and aggressiveness of the respective purchasers for resale.

He also took into consideration competition in the matter of supply, the risk of other gas fields being discovered closer

to Denver, and the possibility of bringing gas from the Hugoton field in Kansas; and also the competition of other fuels (p. 2667).

He considered also the pipe line hazards due to outages resulting from various causes, which he described in considerable detail (pp. 2668-71).

He considered the fact that the management was of the highest order (p. 2672).

His final conclusion, taking all of these matters into consideration, was, that 8½% would be a fair return (p. 2673).

Arthur H. Bosworth, a witness for the respondent, testified on rate of return (Exhibit 93, Vol. XX, p. 2766).

He graduated from Yale in 1908 in mechanical engineering, and entered the employ of William E. Sweet & Company, investment dealers in Denver. For the first three years his duties were primarily in purchasing, and in that connection he traveled throughout the states of Colorado, Wyoming, Idaho, Montana, Utah, New Mexico and Arizona.

In 1914, the firm of Sweet, Causey, Foster & Company (p. 2766) was merged with another local investment house under the name of Sweet Causey, Foster & Company, and he became Vice President.

At the end of 1916 he founded the present firm of Bosworth, Chanute, Loughridge & Company.

He is a Director, Vice President and member of the Executive Committee of The Denver Union Stock Yard Company, a Director of Daniels & Fisher Stores Company and The Denver Fire Clay Company (p. 2767), and Chairman of the Board of North Oklahoma Gas Company (p. 2767).

He was formerly a Director of the First National Bank of Denver, prior to the passage of the Federal law prohibiting an investment banker from being a director in a National Bank.

His own firm specializes in handling municipal bonds and local securities, and participates either as underwriters or selling group members in a great many national issues (p. 2768). His firm has been interested in natural gas securi-

ties for a number of years. In 1935 they, with associates, organized the Northern Oklahoma Gas Company, serving Ponca City and nearby points. In 1936 his firm was a member of the purchasing group which acquired the captal stock of the Oklahoma Natural Gas Company, and have distributed to their customers the bonds, convertible preferred stock and common stock of that company, and have dealt in the bonds and common stock of El Paso Natural Gas Company, the Mountain Fuel Supply Company and the Lone Star Gas Company common stock, and distributed a block of stock of the Interstate Natural Gas Company.

In 1930, and again in 1935, he testified as a witness on rate of return for the Denver Union Stock Yard Company (p. 2769).

In his study of the subject of rate of return he secured statistics and information from the company and examined reports of the Public Service Company at the office of the Colorado Public Utilities Commission, and talked with officials of the company. He gave consideration to the specific customers of the company, which he listed (p. 2770), and considered the possibility of competition by the discovery of gas fields much closer to the consuming markets, and he also considered the franchise situation in Colorado and the attitude of investors toward natural gas securities (p. 2771).

Electric companies, manufactured gas companies and water companies expect to remain in business almost in perpetuity. The life of a natural gas utility depends upon the life of the supply, which is the greatest hazard any natural gas pipe line company has. It is an extractive industry, comparable to an oil industry or mining industry (p. 2772). A gas company has to sell its heating units, and these same heating units can be obtained from electricity, coal or oil. That is one reason why the investor does not consider the gas industry as safe as other classes of utilities mentioned. A natural gas company usually sells a substantial part of its output to industrial consumers, and fluctuations in business affect the earnings of a natural gas company to a greater extent than is experienced by other public utilities. Therefore, the investor, at the same rate of interest, would prefer to invest in the securities of other public utilities.

Evidence that the investor believes that the securities of natural gas companies have more inherent risk than those of other public utilities is found in the fact that certain states having laws regulating the investments of savings banks discriminate to some extent against natural gas issues (p. 2773), including Connecticut, Pennsylvania, Maine and Massachusetts.

Then follows a somewhat detailed description of the company and its business (pp. 2774-76), showing generally the growth of the business.

He then referred to a rule announced in the Bluefield Case (p. 2777).

He thought it a fact that investments in this part of the country usually carry a somewhat higher return than is the case in the East or Middle West.

Since it is impossible to find other businesses which have the same risks as this company, he thought the investors' appraisal of what the rate of return should be, should be considered (p. 2778).

He listed in Schedule 1 a brief description of nine natural gas companies whose securities have a fairly active market. They are:

El Paso Natural Gas Company

Interstate Natural Gas Company

Lone Star Gas Company

Memphis Natural Gas Company

Mountain Fuel Supply Company

National Fuel Gas Company

Oklahoma Natural Gas Company

Panhandle Eastern Pipe Line Company

Southern Natural Gas Company

In each case the capitalization of the companies is shown, the recent earnings per share of common stock, and market quotations. The dividends per share paid during the past year were shown, and the percentage of earnings per share

to the market price, and a brief description of the business of each company.

It is significant that if the percentage of earnings per share on the market price of the stock is taken in each case and averaged, the resulting figure is 12.21%, from which it appears that the investor expects to buy natural gas common stock on a liberal earning basis.

He said that the rate of return should be a single rate applicable to the value of the (p. 2779) entire property, leaving the disposition of the income derived to the judgment and convenience of its owners.

He then showed the earnings price ratios of a number of speculative or highly profitable ventures, mostly mining companies, as ranging from 13.3% to as high as 341.2% (pp. 2781-83).

He next referred to earnings price ratios of stocks in the so-called Standard Oil group, ranging from 9.12% to 14.66%.

He next listed a number of other oil companies showing earnings price ratios of stock ranging from 8.15% to as high as 20.67% (pp. 2784-85).

He then listed a number of speculative stocks also showing earning price ratios ranging from 10.30% to as high as 30.28% (pp. 2786-87).

He then gave his opinion, based upon a consideration of all of the factors touched upon, that a reasonable rate of return for the Colorado Interstate is 8% (p. 2888).

Charles W. Knapp, Jr., a witness for the Commission, testified on rate of return (Exhibits 225 and 225-A, Vol. LXXIV, p. 10799).

He is a principal Examiner of Accounts for the Federal Power Commission, and is employed by the Division of Finance and Statistics (p. 10794).

He graduated from the University of Vermont in 1931 with the degree of Bachelor of Arts. Following his graduation he studied accounting and became a certified public accountant in 1934 in the state of New York. He had previously, prior to 1931, held various positions as bookkeeper and junior accountant.

In the fall of 1935 he was employed as an accounting expert by the Federal Communications Commission in its investigation of the American Telephone and Telegraph Company (p. 10796), and while with the Commission made an analysis of the principles and methods of consolidation employed in preparation of the published financial statements of the Bell System, and also prepared historical analyses and reports on investments of the A. T. and T. Company and its operating subsidiaries, and collaborated in the preparation of the financial history of the Western Electric Company.

In June, 1937, he was again employed by an accounting firm, and was in charge of the annual audit of the United Aircraft Corporation.

In April, 1938, he resigned to engage in private business as a public accountant, and in December of that year accepted his present position with the Commission (p. 10797). He has been engaged in studies and in the preparation of exhibits on the subject of rate of return, and has testified as a witness for the Commission on this subject in five rate proceedings, all electric companies except Natural Gas Pipe Line Company of America and New York State Natural Gas Corporation (p. 10798).

His written statement, beginning on page 10800, explanatory of the exhibits, is quite lengthy, as the exhibits themselves are very lengthy.

He testified that after the completion of these exhibits he learned of the refunding operations of the Panhandle Eastern Pipeline Company during the month of January, 1941. There was a public offering through an underwriting group of $12,000,000 principal amount of 3% Series B first mortgage bonds. These bonds carried only A rating, and were offered to the public at 102⅞ of principal amount to yield 2.87% to purchasers (Vol. LXXXIII, p. 12301).

In conjunction with the public offering of Series B bonds, the company sold privately $6,250,000 principal amount of Series A bonds to four banks and insurance companies. Series A bonds mature serially in equal annual installments on November 1, 1946 to 1950 inclusive, with interest rates ranging from 1.65% to 2.30%, according to maturity.

At the same time the company arranged for the private sale of $5,000,000 face amount of Series notes due in four equal installments on November 1, 1942 to 1945 inclusive, with interest rates ranging from .75% to 1.50% according to maturity.

It was reported that the proceeds of the three issues were to be applied to the reduction of the company's outstanding first mortgage bonds in the amount of $22,300,000. These were 4% bonds due March 1, 1952 (p. 12302).

The cost to the company on the first bond issue was 3.07% (p. 12303).

The first case he testified in was the Safe Harbor Case, in which he used the same general headings as in this case, and the treatment in Part 1 of Exhibit 225 was generally the same as in this case. The same is true of the other electric cases in which he testified (p. 12306).

In the two natural gas cases the material was generally the same as in this case.

Part 1 of Exhibit 225 he would use in any case, whether electric or gas, before the Federal Power Commission. It consists of what may be said to be background material (p. 12307).

In presenting his studies he did not express an opinion as to what the rate of return should be. He was not instructed to recommend a specific rate of return, but merely to prepare a study which contains the facts and factors which should be considered, and in that work he had a free hand (p. 12308). The principles governing the assembly of information are essentially those laid down in the Bluefield Case (p. 12309).

The purpose of Exhibit 225 was to give a general picture of what the money market is, and what investment opportunities are generally.

Chart 1 and supporting Schedule 1 was derived from Moody's Investors Service (p. 12310). The bonds in that schedule are given a rating of Aaa.

There is no company that is engaged solely in the gas business, either manufactured or mixed. The same is true of the bonds with AA rating (p. 12311), and on the succeeding page

bonds rated as Baa, except for Peoples Gas, Light and Coke Company, a company that distributes mixed gas in Chicago, and which is one of the largest distributing companies in the country.

Moody's, in selecting for their investors service these groups of bonds of the four ratings, only included the one company that receives its revenues only from the sale of gas, and that happens to be the lowest rating of these groups (p. 12312).

The electric industry is the only industry which in rate of growth and future prospect and national importance is in any way comparable to the natural gas industry. He gave consideration to the fact that the natural gas industry is based upon extracting a diminishing asset or an exhaustible asset, and that the electric company does not have that limitation. Notwithstanding the difference, he thought there was a better comparison than with the gas company that buys its gas from one of the pipe line companies (p. 12314).

The only way a company like the Colorado Interstate can grow is for the gas distributing companies to grow (p. 12315).

The growth of Colorado Interstate's business is largely dependent on what the Public Service Company of Colorado does with its gas distribution business, rather than what it does with its electric distributing business (p. 12316).

Chart 1 was not put out for the purpose of indicating it has any direct bearing on what the rate of (p. 12317) return should be.

The yields on Treasury bonds, the same as short term commercial paper, have no direct bearing on what the rate of return shall be (p. 12318).

In Chart 4 is shown the bonds of forty public utilities, and here again the only company that is exclusively in the gas business is the Peoples Gas, Light and Coke Company. The purpose of the Chart is to show the trend of interest on bonds of that character (p. 12321).

Chart 5 shows yields on forty utilities, forty industrials and forty railroads. He was not putting this chart and the schedules in to indicate that these companies or all of them

have the same corresponding risks and uncertainties as Colorado Interstate, but he gives investment opportunities on that type of bonds and shows the trend of interest rates and the investors appraisal of the yield (p. 12322).

The list of companies in Schedule 7 and 7-A relate to yields on outstanding preferred stocks of electric operating utilities, and these were selected by him on the basis of preferred dividends being earned one and one-half times in 1938, and for which market quotations in each year could be obtained during the period 1929 to 1939 (p. 12325).

The common stock shown in Schedule A relates to a different group of companies. They are the ones that had common stock outstanding, with respect to which he could get information (p. 12326).

In terms of an unweighted arithmetic average, the earnings price ratio for the group of fourteen common stocks was 4.06% in 1929, and increased in the three succeeding years to 4.59% in 1930, 5.95% in 1931 and 7.74% in 1932. This abated somewhat from 1933 to 1939, ranging from 7.02% in 1933, 7.57% in 1934, 7.32% in 1935, 5.89% in 1936, and advancing again in 1937 and 1938 to 6.77% and 7.42% respectively, and in 1939 declined again to 7.04% (p. 12328).

The yields which investors have demanded on common stock have not been parallel with the yields which they demand on bonds (p. 12329).

In his chart on Schedule 8, the purpose of showing the average was not to indicate that the average had significance as representing the best investment situation, but merely to disclose the trend for common stocks for which earnings price ratios were available (p. 12331). If he were going to finance any electric utility he would have to take into consideration what the demands of the investors were for yields on common stock, and there are a lot of new issues where the yields run 8% and more in the last few years (p. 12332).

He did not contend that you can consider a rate of return without considering cost of equity capital. He thought the only investment consideration that should be considered

with respect to Colorado Interstate is the best investment situation (p. 12333).

As shown on Schedule 6, the weighted average of bond yields of public utility companies, and as shown on Schedule 8, the average yield for common stocks for the years indicated, are as follows:

For 1929, bonds 5.37; stocks 4.06; total 9.43;

For 1930, bonds 5.11; stocks 4.59; total 9.70;

For 1931, bonds 4.65; stocks 5.95; total 10.60;

For 1932, bonds 5.66, stocks 7.74; total 13.40;

For 1933, bonds 4.95; stocks 7.02; total 11.97;

For 1934, bonds 4.81; stocks 7.57; total 12.38;

For 1935, bonds 3.92; stocks 7.32; total 11.24;

For 1936, bonds 3.56; stocks 5.89; total 9.45;

For 1937, bonds 3.56; stocks 6.77; total 10.33;

For 1938, bonds 3.49; stocks 7.42; total 10.91;

For 1939, bonds 3.45; stocks 7.04; total 10.49.

(pp. 12336-37)

Schedules 9, 10 and 10-A do not list companies that are engaged solely in the gas business (p. 12341). The same is true of Schedules 10-B, 11 and 11-A.

That portion of this exhibit relating to economic conditions was merely background material (p. 12344).

Exhibit 225-A shows a considerable increase in customers of natural gas companies from 1929 to 1939 (p. 12362).

About 1926 was when the first long distance pipe line was constructed (p. 12363).

In the next exhibit, Schedule No. 2 shows the dollars reflecting the additional sales which these pipe lines have made to industrial customers and new groups where no gas had been distributed before.

"Q. So we have during that last decade a condition in the natural gas industry of growth that was based

on different facts than growth that might have taken place in the electric industry in that same period?

"A. Well, I don't know just what—

"Q. I mean this: In 1930 practically all of the communities (consumers) that resided in the United States did have electric service and the growth that took place in that period would be increased consumption by the people who lived there or by the industries there rather than the installation of electric service in the areas where there had been no such previous service?

"A. Well, except for the increase in rural sales, that might be so.

"Q. But there is a different situation of natural gas where large cities such as Denver, Detroit and others that (p. 12364) formerly had distributed manufactured gas, then changed over to natural gas, and that would bring a large group of customers in in a short period of time for the total number of customers being served with natural gas?

"A. That is right."

With respect to Chart 3 in Exhibit 225-A he did not include in the curve any industrial sales (p. 12365).

"Q. It is the change over to natural gas that increases the volume. On that same chart you show transported in interstate commerce three times as much gas in 1939 as in 1926, do you not?

"A. That is correct.

"Q. That indicates long distance transportation?

"A. That is right.

"Q. And again you go from 23 states where gas was consumed in 1926 to 35 states in 1939. That again indicates, does it not, a tremendous area where natural gas was never served before and is now being served?

"A. That is correct." (p. 12369).

Starting with 1937, the average approximate yields to maturity of the bonds issues shown in Schedule No. 5-A are as follows:

For 1937, 4%; (p. 12370)

For 1938, 5.26%;

For 1939, 4.81%;

For 1940, 4.89%;

For the four years the arithmetic average is 5.05%.

On Schedule No. 6, relating to bonds of natural gas companies sold during the period January 1, 1935, to October 15, 1940, the prices at the time of issuance as distinguished from the market prices shown on Schedule 5-A, average 3.57%. That is the weighted average (p. 12371). The arithmetic average is 4.34%.

Taking the issues, the cost to the company or the difference between the per cent cost to the company and the per cent yield to the purchaser is on the average, about .31 (p. 12372).

With respect to Schedule 5-E, the average of the earnings price ratio of the common stock issues is:

For 1937, 13.44%;

For 1938, 12.69%;

For 1939, 12.59%;

For 1940, 13.74%; (p. 12374)

The average for the four year period being 13.12%.

Further Testimony of the Company's Witness, Paul B. Coffman.

Q. You don't know about the bond issue recently, refunding issue of the Public Service of Colorado?

A. No, I don't.

Q. It didn't occur to you that you should check into that company?

A. As I say, I confined my attention solely in this study to those companies upon which we reported and upon which we could find market quotations.

Q. Let's take the next one, the Northern Oklahoma Gas Company. Before you go there, I'll ask you this: Did you know that when you started to making this study, did you take into consideration at all the capital structure of the Canadian River and Colorado Interstate Gas Companies?

A. No. There again I did not see that that had anything to do with this study. I was making an objective study of the investors' appraisal of the risks of capital. I wasn't studying the particular company.

(Vol. XV, p. 2163.)

Q. All right, now, take this Southern California Edison Company, Ltd., and give us what your bond rating of that company is.

A. Well, the capitalization of the Southern California Edison Company, Ltd. as refunding mortgage bonds, series of 3-3¼, due May 1, 1967, $3,000,000 outstanding, rating A-1.

Q. A-1?

A. A-1.

Q. That's about the highest, isn't it?

A. A-1 plus is the highest. A-1 is next. That's very high rating.

(Continuing) Series B, 3-3¼, due July 1, 1960, 35,000,000 outstanding, also rated A-1, and there is a series of 3-1¼'s due September 1, 1964, 30,000,000, also A-1.

There is Pacific Light & Power Company first mortgage 5's, due July 1, 1942, 4,134,000 outstanding, and that's A-1 plus.

Q. That's about A-1 plus. Now, just exactly what is that?

A. That is our highest rating. In other words, all bonds in the rating class of A, A-1, or A-1 plus, are considered sound investment bonds and the A-1 and the 1-plus, merely indicate the degree of additional coverage or what we call security principal and interest behind the bond.

Q. Let's see, now, let's take this Consolidated Electric Light & Power of Baltimore here—by the way, I'll ask you this: Do you know what sort of business that company is engaged in—Consolidated Electric Light & Power Company of Baltimore?

A. Yes, supplying gas to Baltimore and vicinity.

Q. That is a holding company, isn't it?

A. Well, according to the definition I have already given, it is predominately an operating company because

it is in the service itself rendering the gas service to the community. Actually it supplies electricity and gas without competition to the City of Baltimore and surrounding territory, wholly within Maryland, under franchise unlimited except as to a minor amount of gas business. It also furnishes steam to the central business district of Baltimore.

Q. You are familiar with this Pennsylvania Water and Power Company, aren't you?

A. Well, that company together with the Pennsylvania Power and Safe Harbor Power and Potomac, has a contract with the Pennsylvania Railroad. I am aware of those things, under which power is to be supplied.

Q. You don't know whether the consolidated is holding stock in those two named companies or not—Pennsylvania Company or the Safe Harbor?

A. Well, let's see. The company owns the entire capital stock of the Maryland Counties Gas Company, and a two-thirds stock interest in the Safe Harbor Water and Power, and the remaining stock interest being held by the Pennsylvania Water and Power Company.

The company also owns 25,300 shares of six per cent outstanding common stock of the Pennsylvania Water and Power Company.

Q. What is the rating for the bonds there?

A. Well, the ratings of the bonds in the Consolidated Electric Light, Gas & Power Company of Baltimore in the first refunding mortgage sinking fund bonds, Series M, 3-1/2's due July 1, 1965, 6,466,000 outstanding. It's A-1 plus. As a matter of fact, all of the series under that first refunding mortgage are A-1 plus. There is Series M, N, O, and P, and I know it has assumed certain obligations of Consolidated Gas Company of Baltimore.

City generals, mortgage, 4-1/2's, due April 1, 1954, 6,100,000, those are A-1 plus. In other words, all the bonds outstanding are A-1 plus.

Q. How did it so accidentally happen that when you came to electric utilities you pick out A-1 pluses and when you came to gas utilities you just had one A in the group?

A. Well, that statement, of course, is not true. The listing that I have already described, and it just so hap-

pens that investors generally rate operating electric utility companies on a different basis than they do gas companies and the classification that I have been using is the one which I have already defined as to the elimination process.

Q. You mean gas companies whose stock is held widely by the public when you make that statement?

A. That's correct. It is analyzed.

Q. You haven't made any comparison of gas companies such as Canadian River and Colorado Interstate and Natural Gas Pipeline Company of America with these very profitable electric utilities?

A. Well, I haven't made any comparison of any companies upon which I couldn't get market quotations and have earning statements available to know what the company was doing.

(Vol. XV, pp. 2170-2173.)

Q. Do you know of a company by the name of the Panhandle Eastern Pipe Line Company?

A. Yes; I do.

Q. You didn't include that one in your list, did you?

A. No, I did not.

Q. Do you know the extent of the physical properties of that company?

A. Yes, I am aware of those.

Q. And have you Poor's statement on that?

A. Yes. What figure do you want, the plant and property again?

Q. Yes.

A. As of December 31, 1939 the property, plant and equipment totaled $59,479,728.

Q. Does it give the mileage of main pipe line?

A. It has approximately, as of December 31, 1939, 860 miles.

Q. What states does it operate in?

A. Well, the company operates the natural gas transmission system from the Amarillo gas field in the Texas Panhandle, and in Oklahoma, Kansas and Illinois, and to a point near Dana, Indiana, which is adjacent to the Indiana-Illinois state line.

Q. At that point it delivers its gas for ultimate delivery in Detroit, Michigan?

A. Yes.

Q. Does that indicate or give a figure as to the volume of gas sold or transported during any calendar or fiscal year?

A. I have it in dollars, the gas sales, in dollars.

Q. All right.

A. For the year ending December 31, 1939, the gas sales totaled $11,461,388.

Q. It doesn't give it in Mef.?

A. The total open flow connected in terms of Mef. for the year ending December 31, 1939, was 4,021,000.

Q. That company is engaged solely in the natural gas operations, is it?

A. Yes, sir.

Mr. Dougherty: Excuse me. You said "connected load," or did you say that it was the sale? Is that what they have connected to the well?

The Witness: This sentence says: "The total open flow connected in terms of Mef."

Mr. Dougherty: That is the well. What Mr. Lange wants is the output of the pipe line.

Mr. Lange: Yes.

The Witness: Gas sales in Mef. amounted to 47,850,723.

Mr. Dougherty: Mef.?

The Witness: Mef.

By Mr. Lange:

Q. That is a sizeable company in the industry, isn't it?

A. Yes, it is a sizeable company in the industry.

Q. What do you have these on their bonds?

A. Well, the funded debt has some Texas Interstate Pipe Line Company leasehold purchase obligations—they are outstanding in the amount of $41,000; the Panhandle Eastern Pipe Line first mortgages and first lien bonds, Series A, 4 per cent, due 1952; rating A; outstanding, $22,500,000.

The Trial Examiner: Is that your rating, Mr. Coffman, or is that Poor's?

The Witness: This is Poor's.

By Mr. Lange:

Q. You haven't any rating on them?

A. We have a rating on it, but since it was excluded from our list I don't have our sheet, but again the ratings would be about the same.

Q. Now, then, how did the size of that company compare, for instance, with the El Paso Natural Gas Company that you have in your list?

A. Well, the El Paso Natural Gas Company for June 30, 1940, had property, plant and equipment of $22,266,832, and the Panhandle Eastern Pipe Line Company had for December 31, 1939, property, plant and equipment of $59,479,728—a little less than half.

Q. You don't have in your list the Northern Natural Gas Company, do you?

A. No.

Q. Will you look at Poor's on that company and give us the size of the physical properties—the extent of the physical properties?

A. Northern Natural Gas Company as of December 31, 1939, had plant, property and equipment, and so forth, of $49,631,451.

Q. What states does that company operate in?

A. Well, it operates natural gas transmission lines extending from the Texas Panhandle and the Hugoton-Kansas gas field to South Dakota and Minnesota.

Q. Give the mileage of main lines.

A. The mileage is approximately 2730 miles with the company and its subsidiary.

Q. The volume of its gas sales in the last year?

A. No, sir, that figure isn't given.

Q. Is it given in dollars?

A. The only figures given in dollars are gross earnings from operations and as of December 31, 1939 that was $11,194,470.

Q. What is given on the company's outstanding bonds?

A. Well, it has common stock outstanding of 203,000 shares, and that is owned 30 per cent by Lone Star Gas Corporation, 35 per cent by North American Light & Power, and 35 per cent by United Light & Railways Company. It

has $16,000,000 of first mortgage and first lien bonds, Series A, 3-1/4's of 1954 outstanding; Poor's rating, A. That comprises the capital structure.

Q. Now, that company is engaged solely in natural gas operations?

A. Yes, that is correct.

Q. And you don't think that the inclusion of that company or a company of that size, any of the physical properties in operation, is essential to get a correct picture of the industry?

A. Well, there again I couldn't get the investors' appraisal of the securities because they weren't in this period being transacted over the counter so you could get some idea of the investors' appraisal of what the shares or bonds were worth.

Q. You did state, however, that your company has a rating on all of those companies; that is, the United Gas Pipe Line, and Northern Natural, and Panhandle Eastern?

A. I don't believe I said quite that. If bonds are held exclusively by a given company so that there is no general investment in it, we don't rate the bond because there is no purpose in it.

Q. Poor's rates all of those, doesn't it?

A. Poor's has ratings on these.

Q. And where do they get their information?

A. Well, they get the same information we get.

Q. But they include them in their ratings?

A. Well, they give a rating on the issues of which I have discussed.

Q. What does Poor's attempt to reflect? What is the purpose of the use of Poor's in the industry?

A. Well, they are supplying information to investors the same as we are, and wherever there is any general investment interest in a security they supply the same information that we do.

Q. Well, isn't the broader the gauge the better the information—the more accurate?

A. Well, I still come back to the statement I made again that if the great bulk of the capital structure of any company isn't traded upon so that you can find either an actual quotation for transactions or at least a bid and ask

quotation, I don't know how you can appraise the investors' attitude toward the risk involved.

Q. Oh, does Poor's list bonds of Canadian River Gas Company and Colorado Interstate Gas Company? Let's have the rating on that.

A. I don't find anything here on Canadian River, and there is nothing on Colorado Interstate directly. There is nothing on either one of those companies.

Q. Nothing on either Canadian River or Colorado Interstate?

A. Not as such.

Q. Doesn't Poor's list them at all?

A. The only reference made to Colorado Interstate is referred to only in connection with the Peoples Gas, Light & Coke Company. There is nothing on it directly.

Q. How is it referred to indirectly?

A. Well, the only reference that I can find is merely a description here of certain contractual relationships in regard to gas supply.

Q. Contractual relationships?

A. Yes. It says: "On October 15, 1931, also, Natural Gas Pipeline Company of America entered into a contract with Colorado Interstate Gas Company (in which company the "Peoples" Company has no interest but which, it understands, is owned or controlled by certain other stockholders of Natural Gas Pipeline Company of America) for the purchase, at Gray, Oklahoma, of 25 percent of its requirements for natural gas. Said contract continued in effect until September 30, 1946, and thereafter at the election of Natural Gas Pipeline Company of America for additional periods of two years each. The "Peoples" Company understands that Colorado Interstate Gas Company purchases its entire supply of natural gas under a long term contract from Canadian River Gas Company (in which company the "Peoples" Company has no interest), which, the company is informed, owns leaseholds covering substantial natural gas acreage in the Texas Panhandle gas field."

Q. And as far as you can find, is that all that Poor's has on it?

A. That seems to be the only reference that I can find in here to Colorado Interstate.

Mr. Lange: Well, that's all right, then. I believe that's all for the present, Mr. Examiner.

The Trial Examiner: Mr. Coffman, you used the term here, "investors' appraisal of risks of capital." Now, as a matter of fact, through the application of your formula to the specific companies named in Exhibit 73, doesn't the result merely indicate that the securities of the electric utilities therein named were more favorably received on the average than the natural gas utilities securities named therein?

The Witness: I think that is one way of stating it. I think yesterday that I described it as saying that for the summary on Page 21 which gives them all to you in one view, that the conclusion is that investors, based upon this information I have presented, believe that there is less risk connected with electric utility operating companies or water companies who manufacture gas and mixed gas, than they do believe there is risk connected with the all natural gas companies.

Now, I presume that they look with more favor upon it is equally as good a way to explain it. In terms of risk, however, it seems to me it indicates they feel less risk attached to electrical utility operating companies than they feel there is risk attached to natural gas companies.

The Trial Examiner: Well, now, one further question: Supposing that, we'll say that Colorado Interstate, for instance, there is some holder of a large block of stock in that company that desires to place that stock upon the market and sell it to the public and supposing a prospective purchaser contacts you seeking whatever information you had, we'll say, with regard to this particular purchase, and supposing that at the same time another offer of securities was made, we'll say, by the Boston Edison Company. Would you advise the prospective purchaser of the securities of the Colorado Interstate Gas Company that that purchase involved a risk of approximately 3.75 per cent greater than the purchase of the securities of the Boston Edison Company?

The Witness: Well, I think our first approach would be to that problem that we would consider information such as given here. It gives some idea to either the purchaser or the seller as to what the general appraisal seems to be at the present.

Now, in the case of the Colorado Interstate, we would consider, for instance, the question of marketability on the one hand and in contrast to Boston Edison as a separate consideration. We would also consider the fact that to date we, and we believe, investors generally have had no information on Colorado Interstate; whereas, we have had what we consider to be reasonably good information in regard to Boston Edison and it would be a question in looking over all of these risks of apprizing the investor of what we thought the thing was worth if we had more information to go on. If we didn't have any more information in regard to Colorado Interstate under the circumstances you mention than we do right now, all we could hope to do would be to present some general information of this kind and then let the prospective buyer form his own opinion. As a matter of fact, in the case of the Colorado Interstate, if we had no balance sheet and operating statements, we wouldn't advise the man what we thought about the price at all because we have nothing to go on except this general information here which shows the general class of yield at the time.

The Trial Examiner: But that is all that you could submit to him, would be general information? You couldn't on the basis of your formula here, you couldn't get down to the specific risk involved in the purchase of securities in Colorado Interstate Gas Company?

The Witness: Well, we could approach it on the basis that we have this general information; that is, how in the general utility field on the whole one class of security seems to sell in comparison to another. We feel that would be helpful to a prospective buyer.

If his question to us is: "What should I pay for Colorado Interstate common stock?" let us say, we would have to say just what I have said in this hearing, that we have no financial and operating information in regard to that company. Therefore, we couldn't pass an opinion on that phase of the question.

Mr. Lange: Just one further question.

Q. Isn't it true, Mr. Coffman, that an investor when

he desires an appraisal of securities he wants the appraisal of any particular company, not of a lump group?

A. I would say that was not correct. When we make an analysis in our business of companies we first start with as thorough an analysis as we can make of the industry to see what actually is happening in that particular type of activity—industrial activity, and then from that we come down to individual companies, and I think we are giving that full weight right along the line on all the companies, regardless of whether utility, industrial, or what it is.

Q. But in the instance as cited by the Examiner, you wouldn't be able to give them anything on Colorado Interstate or Canadian River?

A. Not on the individual company because we do not have financial or operating statements on those companies.

Q. Well, what information do you give investors with reference to individual classes of stock as between common and preferred, for instance, of a company?

A. Well, I am not sure I get your question. We present in our service, of course, the balance sheet as it is reported in the annual report which shows the breakdown of the capital structure as to commons, preferreds, and bonds.

Q. Your appraisals to investors are not as to individual classes of stock?

A. Well, in our earnings bulletin, as I have pointed out, we group them according to class so that a man can look across the board.

(Vol. XVI, pp. 2193-2204.)

* * * * *

Q. Can you get the appraisal of a risk of a particular company if you only have, say, bonds as a part of your study and have no information on what prices have been paid for other securities of the company?

A. No, unless we could get quotations on the capital structure as a whole so that we could see what we term the indicated market value of that capital was, we couldn't get the appraisal of the investor.

Q. Is it necessary, then, in order to get the general picture, and an accurate picture of the investors' appraisal of any particular company that you have this information on all securities that that company has outstanding?

A. Yes, it is.

Q. Is that the reason why you didn't include gas companies such as Northern Natural, Panhandle Eastern, and United Gas Pipe Line Company?

A. It is.

Q. If the other securities; that is, if the securities of those companies other than bonds had been bought and sold during this period in such a manner as to give you a record of what the sales were, would you have included them?

A. If we would have had sufficient information we would have included them.

Q. You were asked a question the other day—or yesterday—about Public Service Company of Colorado, as to why you did not include that. Can you tell us why, referring to whatever information you need from Poor's manual?

A. Well, the Public Service Company of Colorado is a subsidiary of the Cities Service, Power & Light; and it has a total funded debt outstanding, December 31, 1939, of $52,500,000. Further, the income account—the consolidated income account, ended December 31, 1939, showed that electrical revenues were $11,797,769; whereas, the gas revenues were $5,510,878, so that it wasn't a natural gas company and fit into the division of which we were discussing the natural gas company group.

Q. Does that Manual show the ownership of the common stock of Public Service Company of Colorado?

A. The common stock, $100 par, was outstanding in the amount of 229,900 shares. Cities Service Power and Light Company owns 229,879 shares, or 99.99 per cent. It also owns 31,235 shares of the 7 per cent preferred; 7644 shares of the 6 per cent preferred, and 1356 shares of the 5 per cent preferred.

Q. In the absence of any sales of common stock of that company, could you form an opinion as to the investors' appraisal of the risk of capital in that particular company?

A. Well, no, we couldn't, because the common stock in that particular case was a very important section of the capital of the company as a whole.

(Vol. XVI, pp. 2209-2211.)

Further Testimony of the Company's Witness Gilman.

Q. What do you understand is the thing that is referred to as the spread of the underwriters or the amount which the underwriters obtain for selling these securities—take bonds, for example?

A. The cost of financing a particular class of securities is composed of two items; one, the fee or the commission which the underwriter gets for his work in selling the issue to the public, and the second part, the cost which is necessarily incurred by the company for its counsel for its cost, perhaps, of obtaining the approval of the registrary authorities; for printing of its prospectus, for its accountant—the *sume* of the two go to make up the total cost of financing.

In the normal case the public utility companies, of which a good many millions of dollars of bonds for refunding have been sold in the last five years, two per cent of two points is by and large the standard fee which is required by underwriters for their services in distributing the securities in sizeable blocks for companies with a good credit rating.

Q. That, as I understand it, is prescribable to bond issues?

A. Bond issues. In addition to that, in connection with the issuance of bonds, there would be the expenses of the company, which I have just described, such as for accountant fees, legal bills, and things of that kind which vary anywhere from one-half of a per cent up to as high as one per cent or higher. So the measure of the cost of issuance of bonds, including the underwriting spread and the expenses of the company, would vary from two and a half to perhaps three per cent. I think two and a half would be a minimum figure.

Q. I notice that you say in your statement that very few preferred stocks or common stocks of utilities have been issued in the last several years. Has there come under your observation, either while you were with the Securities and Exchange Commission or since, any issue of preferred or common stock of public utilities which did cost the companies more for those who sold the stock?

A. There have been a few issues of preferred stocks of public utility operating companies, primarily electrical companies. Generally speaking, they have been issues which

have been of a lower dividend rate and have been put out by electric companies to replace an outstanding issue of preferred stock that had a higher dividend rate of six or seven per cent, and being replaced by a four and a half or five per cent issue. There have been a few issues of that kind by companies of high credit standing.

There have been practically no sales or very few sales of public utility operating company common stocks in recent years—by "recent years" I mean from 1935 to 1940. There have been, as far as my search indicates, only four or five instances involving the sale of common stock of public utility operating companies to the public.

Q. Are you familiar with the price of those stocks to the public at the time they were sold and the commission or charge that the underwriter made in those instances?

A. I am.

Q. Now, having in mind your suggested form of capitalization of a company such as Colorado Interstate of 50 per cent bonds and 50 per cent common stock, what in your opinion would be the cost of financing of the bonds and the common stock—in other words, dividing it into those two factors—what would be the overall cost?

A. Well, if under today's conditions Colorado Interstate Gas Company would be financed, and if financed as I believe it could be most economically financed, 50 per cent bonds and 50 per cent common stock to the public, in my opinion the cost of obtaining the borrowed portion of the money would be a minimum of 2½ per cent of the proceeds. The cost of obtaining the equity portion would be substantially higher. As I say, there have been few sales of public utility common stock in recent years from which to obtain a gauge of what underwriters would require. There have been no sales of any importance of pipe line company stocks. I think the best indication of what it would cost to sell the common stocks of a company such as Colorado Interstate Gas Company would be obtained from an examination of what it has cost to sell the common stocks of the few companies which have been sold in recent years. Among those are the common stocks of the Washington Gas Light Company, Indianapolis Power and Gas Company, Newport Electric Corporation, Michigan Public Service Company, and Danbury & Bethel Gas & Electric Light Company. Those

as I say, as far as my search indicates, are the only important issues for sale to the public of common stock of public utility operating companies in recent years.

In the case of the Indianapolis Light and Power Company, a large electric company serving Indianapolis, Indiana, where approximately $5,000,000 worth of common stock was sold to the public, the underwriting discounts and commissions were $1,429,670 or 8.3 per cent of what the public paid for the stock.

In the case of the Newport Electric Corporation, a smaller electric company serving Newport, Rhode Island, the common stock was sold to the public under which the underwriter's commission was $2.50 per share for common and the sale price to the public was $29.50 a share or a cost of 8.5 per cent.

In the case of the Washington Gas Light Company in which approximately $10,600,000 of common stock were sold to the public, the fees and commissions to the underwriters—I should say, rather, the underwriting discount or commission—amounted to $576,683, or 5.4 per cent of the price to the public. In that case it should be noted that the underwriters did not enter into a firm commitment to purchase the stock. They did agree to purchase a portion of the stock and they underwrote that in the common sense of the word "underwrite." The balance of the stock they sold from the box—in other words, they took no commitment with reference to the balance of the stock—so that is not really a fair measure. They didn't take a risk on all of the stock and their fees were below what would be considered customary.

In the case of a recent issue of common stock in November 1940 where the stock was offered to the public and sold to the public, but where I understand the offer was later withdrawn, the underwriting fees and discounts were $1.50 per share of common, and the sale price was $17.50 per share of common stock or a figure of 7.2 per cent.

Q. What company is that?

A. The Danbury & Bethel Gas & Electric Light Company.

I have omitted one company, which is the common stock

of the Michigan Service Company, a small operating company, primarily an electric company in the lower peninsula of Michigan, where the underwriting discounts and commissions were approximately 13 per cent of the price to the public.

The range which covered these five issues of common stocks show a cost of issuance in the Washington Gas Light Company where there wasn't a complete underwriting, from 5.4 per cent to 13.7 per cent as in the case of the Michigan Public Service Company. There were several substantial issues in the neighborhood of 8 per cent.

In my opinion, if Colorado Interstate Gas Company were to offer their underwriters common stock for a sale to the public under today's condition the cost of the issuance, including underwriting, discounts, commissions, and expenses, would be at a minimum 8 per cent. Therefore, if 50 per cent of the capital is obtained through bonds which cost 2½ per cent, as I have previously stated, and 50 per cent common stock at a cost of 8 per cent, the overall cost of obtaining all of the capital would be 5.25 per cent.

Q. In your opinion is that a reasonable estimate of the cost of financing for a company of this sort under the capital structure you mentioned?

A. It is.

(Vol. XVI, pp. 2290-2295.)

* * * * *

Q. And have you testified in any other proceeding in the rate of return?

A. Yes, I testified in the proceeding before the Federal Power Commission and the Illinois Commission in the matter of rate of return for the Natural Gas Pipeline Company of America.

Q. And what rate of return did you testify to in that proceeding?

A. Eight per cent.

(Vol. XVII, p. 2303.)

* * * * *

Q. Do you know what company or group controls the Colorado Interstate Gas Company at present?

A. I do.

Q. Who?

A. 42½ per cent of the common stock is owned by Standard Oil Company (N. J.); 42½ per cent by Southwestern Development Company, and 15 per cent by Public Service Company of Colorado.

Q. Well, you state, though, in your testimony, that you would propose a financial structure that would consist of 50 per cent bonds and 50 per cent stocks for this company, didn't you?

A. Yes, if it were being financed today I think that would be a reasonable financial structure for the company.

Q. Why?

A. Because I think that is the financial structure under which, if the company was to be financed today, that would give the most economical cost of capital.

Q. Why wouldn't this enterprise be financed now as it was when it was constructed?

A. Well, I could make no assumptions. I have to assume, or anybody would have to assume that if the company were to be financed today that it would be financed with public sale of its securities.

Q. And you are certain that it could not be refinanced in the same fashion that it was originally financed?

A. I wouldn't say that it couldn't be, but I would say the probabilities are that it would not be and I am trying to adopt a most reasonable probability.

Q. Of the construction or financing of a hypothetical company newly organized, or to be newly organized?

A. I don't believe that under today's conditions that it would be feasible, proper or reasonable to assume that a natural gas pipe line enterprise such as this kind would be financed through the issuance of debt up to 80 or 90 per cent of the value or cost of construction.

Q. Well, have you approached this whole subject in the light of reconstructing a hypothetical company here with its properties?

A. No, sir.

Q. Have you given any consideration to the original cost of the properties?

A. I haven't attempted to determine any values of the property.

Q. To what extent have you given any study or consideration to the records of this company as to its original cost?

A. Well, I have had available to me the company's finan-

cial statements which show the book value of its fixed capital. I have examined the estimates of reproduction costs new and reproduction costs new less depreciation as introduced in this case and I have looked at the study of original costs prepared by the company.

Q. Well, wouldn't investors be very much concerned with what the history of this company was as to the cost of its properties?

A. Yes, investors are concerned about those things.

(Vol. XVII, pp. 2314-2313.)

* * * * *

Q. Well, then, going back to this contract between Colorado Interstate Gas Company and Canadian River Gas Company, did you assume that that contract would expire and not be renewed at its termination?

A. There is an option arrangement in that contract under which Colorado Interstate Gas Company can continue to get gas as long as it finds that it can economically market that gas.

Q. So you didn't place any element of risk at that point, did you, as to the possibility of no renewal taking place?

A. I don't understand that question.

Q. You didn't assume any element of risk in connection with the possibility of Colorado Interstate Gas Company not being able to get an adequate supply of gas after the termination of this present contract with Canadian River Gas Company?

A. No, I don't think there is any element of risk there. The contract says that Colorado Interstate Gas Company has gas up to a certain time and thereafter it has the right to obtain gas from Canadian River Gas Company as long as it can economically—if it determines it can economically market that gas.

Q. So, insofar as the source of supply of Colorado Interstate Gas Company's requirements are concerned, it will have available to it a supply of gas as long as Canadian River Gas Company can supply it from its own reserves?

A. I think that is right. If Colorado Interstate Gas Company finds that it can economically market the gas, the Canadian River Gas Company under the contract—that option exists.

(Vol. XVII, pp. 2330-2331.)

* * * * *

A. One of the requirements of this list is stated very clearly in that there has to be a common stock outstanding in the hands of the public in order to get an investors' appraisal.

Q. Are these the only ones available for that kind of a study, these in appendix 1, where you can get an investors' appraisal of risks from common stock that is in the hands of the public?

A. Those are the only companies in my opinion which are natural gas pipe line companies not engaged in substantial distribution operations which have gross operating revenues of $2,000,000 or more, and which have common stock outstanding in the hands of the public from which a measure of investors' appraisal may be obtained.

Q. In other words, there are a number of other natural gas companies, that if they had common stock in the hands of the public that you would have taken into consideration?

A. Yes.

Q. Supposing it was the other extreme. This is a pretty small list among the numerous companies operating in the natural gas business in the United States, isn't it?

A. As many as I could get.

Q. Suppose there weren't any at all available; you could not make any study then?

A. We would have to rely upon other information.

(Vol. XVII, p. 2377.)

Further Testimony by the Company's Witness, Sands:

Q. By what mathematical formula do you arrive at 8½ per cent?

A. That is purely a judgment figure after considering all of the hazards.

Q. That is purely a judgment figure?

A. Purely a judgment figure. It is just arrived at in the same manner as a legal opinion or a doctor's diagnosis.

Q. You placed it on that same basis?

A. It is professional judgment.

(Vol. XIX, pp. 2695-2696.)

Q. You do know that the natural gas as well as all electric energy distributed in Denver is distributed by one company, the Public Service Company of Colorado.

A. Yes, correct. What extent they push either one of the commodities, I don't know.

Q. To what extent they are competing with themselves, you don't know?

A. They are very active, and I presume they push their commodity—

Q. But you don't have that character of direct competition between two companies that you had cited as obtaining in those other towns?

A. That's right, on cooking and refrigeration. That's not true of coal, of house-heating.

(Vol. XIX, pp. 2713-2714.)

* * * * *

Q. Did you give any consideration—strike that.

In determining the element of risk that may be there, did you give any consideration at all to the corporate affiliation between Colorado Interstate Gas Company and Public Service Company of Colorado?

A. No, I assume that—

Q. That has no bearing on your assumption at all?

A. No, that relationship is going to be economical, entirely.

Q. It is an economical relationship entirely?

A. Yes.

Q. And you gave no consideration to the background of the history of this project at all in connection with the—

A. No.

Q. —with Colorado Interstate Gas Company and Public Service Company of Colorado?

A. No.

Q. Do you know what company owns Public Service Company of Colorado or the majority of its stock or any phases of the corporate control?

A. I believe Cities Service Power Co.

Q. Do you know what company owns the control of Cities Service?—Cities Service and Power?

A. I am under the impression that Cities Service does.

Q. And you, of course, know that Public Service Com-

pany of Colorado owns the control of Colorado-Wyoming Gas Company?

A. I have no idea who owns control of Colorado-Wyoming.

Q. Oh, you do not?

A. I stated that just a few minutes ago.

Q. Now, then, you say that because of the expiration date, this Denver contract, and the obtaining of a new franchise at the time of such expiration, the element of risk comes into the picture as discussed by you. What in your opinion will take place at the time of expiration of that contract?

A. Will take place in what way?

Q. As to the possible renewal of the contract, or the continued purchase of natural gas by Public Service Company of Colorado from Colorado Interstate Gas Company?

A. You don't expect me to prognosticate the vote of the people of Denver, do you? I am a poor hand at prognosticating votes, I find.

(Vol. XIX, pp. 2724-2726.)

* * * * *

Q. When has there been any total interruption of service to domestic users since then at Denver?

A. Give me just a minute and I'll see if there have been any more. I think that is the only total interruption.

Q. How long has this company operated?

A. It started sometime in 1928, I believe.

Q. There has been one total interruption during that entire period up to date?

A. One total interruption of 49 hours.

Q. All right, because of that interruption, did any of the people that had used gas cease using it because they were afraid of that risk?

A. I don't think that's the question.

Q. Oh, it isn't? Well, what is the question of the risk?

A. The question is, did anybody fail to come out on the line and use gas?

Q. After that time?

A. After that time.

Q. Have there been any people or any possible users that have failed to come on the line because of that break?

A. I couldn't tell you.

Q. You don't know?

A. No, I don't.

Q. Did they lose any customers at that time because of the break?

A. I don't think so. I don't know.

Q. Well, what character of risks do you have in mind that these supposed breaks or interferences—what is the character of risk that you have in mind?

A. You are just talking of one outage, the one of 9/9/33, that's a total outage.

Q. I want to know what effect it had, if any, and the risk element that you took into consideration in preparing this rate of return study.

A. All right.

Q. Is it purely a mechanical risk or what?

A. The longest out they had, not a total outage, was 63 hours at one time. That was the Colorado Portland Cement Company.

Q. And that was an industrial load.

A. That was an industrial load that was cut off to preserve the domestic load.

Q. Well, all of these industrial contracts except a particular part of Colorado Fuel & Iron have that provision that they are subject to being cut off?

A. That's right.

Q. Surely.

A. That's right.

Q. Why does that constitute a risk?

A. It constitutes a risk. How often can these outages occur and still have the company continue to use the gas service?

Q. The company can continue—you mean the purchaser?

A. Yes, the ultimate purchaser.

Q. This purchaser doesn't know the element of weather?

A. No, but he wants continuity of production in operations.

Q. He writes his contracts and he knows that his service may be interrupted at any time the degree days are such as to make it imperative on the company to interrupt that service, doesn't he?

A. Yes.

Q. All right, is that a risk that you have taken into consideration?

A. You bet your life.

Q. The character of the contracts that the industrial consumers enter into giving domestic priority over them, that is a risk that you take into consideration?

A. Yes, sir.

Q. Has the company, as a result of placing such a condition or restriction in its contract, lost any of its customers at any time?

A. That I don't know. I just know that it is sound business to know that a company is not going to be cut off for seventy-five hours—I think it was—very frequently.

Q. And the contracts—

A. And the companies don't care about the—the manufacturer, the producer won't stand for continuous interruptions. He can't afford to.

Q. Even though the same interruptions would occur because of weather conditions that would necessitate the interruption of his service, because of cold days that require the interruption of the service to industrial users because of the requirements of domestic users?

A. You'll have to repeat that question. Read that.

Q. Just strike that. I'll make it this way:

The contracts that are entered into between the industrial users and the Colorado Interstate Gas Company all have priority of service, don't they?

A. That's right.

Q. And the industrial users enter into those contracts with that condition in them?

A. Yes, that's correct.

Q. And those priority of use provisions come into play whenever cold weather sets in to such a degree that the domestic use may demand the deferring or cutting off of that industrial user?

A. Yes.

Q. He enters into that contract with that condition in mind, doesn't he?

A. He does, and realizing and hoping that that hazard won't be too great, but if that hazard becomes too great he won't continue as a customer, because he can't afford to do it.

Q. Well, has the company lost any industrial customers because of that hazard?

A. I can't tell you. It is a hazard that exists.

(Vol. XIX, pp. 2737-2741.)

* * * * * *

Q. Mr. Sands, in your exhibit you state you have an office in the First National Bank Building of Denver?

A. Yes, sir.

Q. What position, if any, do you hold with any department of the City of Denver?

A. I am on the Water Commission of the City of Denver.

Q. The Water Commission of the City of Denver.

A. Yes, sir.

Q. How long have you been on that Board?

A. Oh, I think seven or eight years.

Q. You are not appearing in this case in any official capacity, are you, for the City of Denver?

A. None whatever.

(Vol. XX, p. 2744.)

Further Testimony of the Company's WITNESS, O'CONNOR.

Q. Just this question in connection with the preparation of the exhibit, Mr. O'Connor: Will you briefly state what information you received and from whom and what was the manner of your assembling the data for the preparation of the exhibit?

A. Well, as far as estimating sales volumes, we had the records of the Canadian River Gas Company from 1928 on, and the records of the Colorado Interstate Gas Company.

Q. Over what period?

A. From inception through 1940.

Q. Both companies?

A. That's right, and then we interviewed the Amarillo Oil Company group and got some information and got some information from Mr. W. W. Rusk, the Chief Engineer, and also from Mr. P. C. Spencer from New York, and then we interviewed each company to whom the Canadian River Gas Company—I mean the Colorado Interstate Gas Company sells gas, both distribution companies and direct customers, and we got information from all of those sources; and then we interviewed the larger industrial customers served by the distribution companies and got further information from

them. We didn't interview anybody in connection with the Chicago line but we found that the company had estimated a practically constant volume of sales in the future—oh, through about the next seven years, and we adopted the same figure for 1941 as actual sales for 1940.

Now, our estimate is higher than the company's estimate, but it is due to the fact that their estimate for 1940; that is, the Chicago Company estimate for 1940 is quite a bit below what they actually did sell. We assumed the sales for 1941 would be practically the same as 1940. The line is pretty well loaded up. I have a long list of people that we interviewed. It runs three pages.

Q. That encompasses the names of the people representing the purchasing companies or industrials to whom sales were made?

A. Yes.

Q. And approximately over what period of time was this information and the data assembled on which you predicated the preparation of the exhibit?

A. Part of the people were interviewed in May and June of 1940, but some of the more important people were interviewed subsequently, some as late as February 1941.

(Vol. C, pp. 15553-15555)

Further Testimony of the Commission's WITNESS, BOSWORTH.

"As a result of the construction of this pipe line, fuel costs for a number of industries were reduced and domestic consumers received a very substantial reduction in the cost of their gas. If you take Denver as an example, in 1927, the last full year in which the Public Service Company supplied manufactured gas, a total of 3,252,107 Mcf. was sold and total gross revenues of the gas department of the Public Service Company for that year were $2,368,145. In 1939, gas sales were 7,054,174 Mcf. and total gross revenues were $4,021,384.

"The revenue had increased about 75 per cent and the amount of gas sold had more than doubled. In one respect this comparison is misleading, because the manufactured gas sold in 1927 contained only 336 B.T.U. per cubic foot, whereas, in 1939 the natural gas had approximately 850

B.T.U. content. In other words, one cubic foot of natural gas in 1939 would do two and one-half times the work of one cubic foot of gas in 1927. Therefore, the consumption in heat units in 1939 was nearly five times that of 1927 and the heat units increased nearly 430 per cent.

"Using the reports from the Public Service Company of Colorado, filed with the Colorado Public Utilities Commission, one learns that in 1927 the Public Service Company received $2.16 per million B.T.U. of manufactured gas (Denver only) and in 1939 the company received an average of 69 cents per million B.T.U. One million B.T.U. might seem like a very large amount but as a matter of fact that is only 1.2 Mcf. of natural gas. These are total figures which include residential, commercial, industrial and other sales. The domestic consumer in 1927 paid $2.50 per million B.T.U. for his manufactured gas and in 1939 he paid 96 cents per million B.T.U. for his natural gas. In 1927, the Public Service Company had practically no house heating customers, but in 1940 there were over 14,000 houses in Denver heated by natural gas. The number of customers is steadily increasing which indicates that the consumer prefers natural gas to other fuels.

(Vol. XX, pp. 2775-2777.)

* * * * * *

Q. Now, Mr. Bosworth, what consideration, if any, did you give to the term of that contract?

A. Twenty year—

Q. The period of its life in this study?

A. I gave full consideration to it.

Q. What consideration, if any, did you give to its expiration date? When does it expire?

A. In 1948.

Q. In 1948?

A. But it is subject to renewal.

Q. It is subject to renewal?

A. As long as Canadian River has gas and as long as Colorado Interstate determines it is profitable to buy on the terms of that contract.

Q. Well, did you give any consideration to that phase of it in your study?

A. Yes.

Q. What respect did that have a bearing on your rate of return?

A. That apparently this gas line has a gas supply as far as can be determined for some years ahead.

Q. What investigation did you make with reference to that?

A. I made none.

Q. You did not?

A. I inquired—I mean, I am not an engineer, you know. I didn't make an engineering investigation.

Q. From whom did you get your information with reference to its supply of natural gas?

A. The latest was from Mr. Hendee.

Q. From Mr. Hendee?

A. Yes. I have been interested in the subject as relating to other things. I talked to Mr. W. H. Ferguson, Executive Vice President of the Continental Oil Company about the Texas Panhandle.

Q. First of all I will ask you this: What did Mr. Hendee tell you with reference to the adequacy of the supply?

A. He told me that there was no question but what the gas supply would extend longer than the Canadian River's contract.

Q. Longer than the Canadian River's contract?

A. Yes.

Q. Did you discuss with him further the character of the holdings in the field, the wells they have, and the productivity they have? Did you go into any of those phases?

A. I asked about matters of that kind. I don't think it is possible for anyone to state just what the life of that field would be with four or five major pipe lines pulling on it. It is a very different situation than when this company started. When it started it was the only one big pipe line drawing on those fields. Since then the other companies have come in and are depleting the field—

(Vol. XX, pp. 2817-2820.)

* * * * * *

Q. What is the correct statement with reference to what the two major markets of Colorado Interstate Gas Company are?

A. Well, certainly the major wholesale market is the Natural Gas Pipeline Company of America because I have just stated that I believe that one-half of the gas handled by this company goes to that line, and the other half goes to the Denver line, and of that about forty per cent of the

gas that goes to the Denver line goes to the Colorado Fuel and Iron.

Q. I was limiting my question to the Denver line.

A. I see.

Q. Considering the Denver line alone, the two major markets on the Denver line are Colorado Fuel and Iron Company and the Denver gate, aren't they?

A. Unquestionably, yes.

(Vol. XX, p. 2830.)

Q. You say there is some element of risk in that there may be a possibility of the contract between Colorado Interstate and Public Service of Colorado not being renewed?

A. I think to this extent: If the company has gas at that time which it can and desires to sell, I think Public Service Company will want to purchase gas from Colorado Interstate, but the question of price, there is certainly uncertainty whether Colorado Interstate can secure as good a price as they are now getting. Nobody can tell today.

Q. The users in Denver and vicinity have converted all their equipment for the use of natural gas, haven't they?

A. Not all.

Q. Those who are using it, of course, are using equipment usable for natural gas?

A. That's right.

Q. Where is Public Service Company of Colorado going to get its gas if they don't get it from Colorado Interstate?

A. Gets natural gas?

Q. Yes.

A. They could, of course, go back to manufactured gas if they had to. They wouldn't do it if the natural gas supply were available. There are eight years yet in which new discoveries might come in.

Q. Where?

A. In Colorado.

Q. Do you know of any?

A. Or it might be possible to get it in Wyoming, because there is a very large amount of gas in Wyoming for which there is now no market, or it is conceivable they could get it from the Hugoton field.

Q. Where is the Hugoton field located?

A. In Kansas.

Q. About what distance is that from Denver?

A. Well, roughly, three hundred miles.

Q. Three hundred miles?

A. Yes.

Q. And you know, of course, that such company would have to apply for a certificate of public convenience and necessity?

A. I do.

Q. They would have to make a pretty detailed showing, wouldn't they?

A. Yes, but supposing they said to the Public Service, somebody came in—you and I, and we said, "We'll bring gas from the Hugoton field," and we make the arrangements down there satisfactorily, and we come up here to the City Council here and say, "We'll sell you gas at 30 cents."

Q. All right.

A. And Colorado Interstate says, "No, our gas is worth 35 cents. We can't afford to sell it any cheaper," then you go to the Federal Power Commission and say, "We want a certificate." I don't believe under the wording of that Act they would have much trouble in getting that certificate, would they?

Q. You mean you could get the gas at Hugoton field and sell it at the gate here at 30 cents?

A. That is an illustration of what might happen. I made no investigation as to whether they could sell it at 50 cents or 25 cents. I can't testify on that without going into an investigation.

Q. What is the illustration worth if it can't be followed through?

A. To show a hazard in spite of the fact that a certificate has to be obtained from the Federal Power Commission.

Q. A hazard to the Colorado Interstate?

A. Yes, of losing this business.

Q. That you think that in your experience as a man who had dealt with the securities of natural gas pipe line companies that they could construct a line from the Hugoton field and transport gas into Denver and sell it at 30 cents and make sufficient on it that they can finance such a project?

A. I didn't say that at all. I said if this contract had run out and if we found by reason of the purchases to be made down there and by a careful investigation of the con-

struction costs of such a line, if we found we could sell it at 30 cents, I thought we could get a certificate from the Federal Power Commission.

Q. I am asking you now, as a man that has had experience in selling securities of this character, whether that basis that you gave, on that assumption, that they could construct a pipe line into Denver from Hugoton and make a showing that they could sell gas at the gate here at 30 cents; the project would be feasible, economical, and that you could get investors to invest in such an enterprise.

A. I certainly made no such statement as that, and I didn't make the assumption that it could be done. I said, if it could be done or if the Public Service Company could get its gas from Wyoming or perhaps in Morgan County, Colorado where there is some gas, or some other place, or we may open up some gas around Fort Morgan. There are a lot of possibilities that may take place before 1948.

Q. There is a lot of possibilities of anything liable to happen, but the only certainty about there being an adequate supply of gas in some other area is the Hugoton field at present?

A. I didn't say that. I say, there is just as good a chance of getting the gas in Wyoming.

Q. There is? Where?

A. Southern Wyoming, I believe there is — Hiawatha, North, South & Middle Baxter Basin, Powder Wash Dome.

Q. Would you advise investors to invest in building a pipe line from there into Denver now?

A. I wouldn't do it without a great deal of study and getting expert engineering advice. That hasn't been done.

Q. In other words, you would know about what the reserves and adequacy and the probable life of them would be?

A. I would attempt to arrive at that information, certainly.

Q. And how certain you would be of the Denver market, too, wouldn't you?

A. Certainly.

Q. Both of those would have to be pretty definitely shown to you before you would attempt to advise anybody of the feasibility of such a project or to put any money into such a project?

A. I certainly agree with you on that.

Q. You haven't made that investigation with reference

to either piping it from Wyoming or from Hugoton, have you?

A. No.

The Trial Examiner: Mr. Bosworth, some mention I believe was made by you of the contract with Canadian River Gas Company by Colorado Interstate where the cost of the gas is based on some sort of a cost arrangement.

The Witness: Yes, sir.

The Trial Examiner: Well, in view of that, do you think it would be possible for production to come out of the Hugoton field at any less cost to the pipe line than the cost to the Colorado Interstate?

The Witness: I don't think so.

The Trial Examiner: Don't you think that the Colorado Interstate Gas Company in view of its trained personnel and its management and its present experience could transport this gas at least as cheaply as any company that would come out of the Hugoton field?

The Witness: I should think so, absolutely.

(Vol. XX, pp. 2837-2842.)

* * * * *

Q. We haven't gotten to that point on this question. You presented one where the pipe line company produces its gas. Isn't it a fact that in this instance the same interest that controls Colorado Interstate Gas Company controls Canadian River Gas Company?

A. I think that is probably true. I can't testify as to that control.

Q. Then you have one other factor entering into that ideal situation remaining open and that is the marketing of the gas?

A. That is right.

Q. Now, then, you have already stated that the Colorado Fuel and Iron Company and Denver constitutes the major portion of the Colorado Interstate Gas Company's market by a large and major portion?

A. That is right.

Mr. Brock: The Denver line?

Mr. Lange: The Denver line.

The Witness: That is right.

By Mr. Lange:

Q. You have the delivery to the Colorado-Wyoming Gas Company?

A. Yes.

Q. Then those three constitute almost what percent of the total market of the Colorado Interstate Gas Company?

A. I don't know that figure because I don't know it.

Q. Roughly, it constitutes the great bulk of the market of that company, doesn't it? Those three gates?

A. Yes, I am sure of that.

Q. What element of uncertainty is there with reference to those three deliveries?

A. Because they do not control the marketing policies. They are wholesalers and it stops there. If they are a retailer and do a good job, fine; if he doesn't do a good job, what can you do about it?

Q. You are then viewing it in the light that the affiliation that exists between them has no bearing as to the certainty and continuity of that market?

A. I am not assuming that there is any affiliation that exists except contractual relationship.

Q. Are you assuming that there is none existing?

A. As far as I know there is none existing aside from the contractual relationship, the fact that the Public Service Company of Colorado owns 15 per cent of the stock in the Colorado Interstate pipe line.

Q. Very well. On the schedule—

A. I would like to—

Q. Yes.

A. May I make one remark?

Q. Yes.

A. I had forgotten for the moment, but as I understand it, the Canadian River Gas Company is 100 per cent owned by the Southwestern Development Company. The Southwestern Development Company owns 42-½ per cent of the stock of Colorado Interstate Gas Company, so there is a relative difference, I think, between the situation that would exist if the Colorado Interstate Gas Company owned a hundred per cent of Canadian River and the existing situation.

Q. How did you arrive at that conclusion that the difference would exist?

A. As I understood the question you asked me, the purport was "Why isn't it just the same thing as Colorado Interstate owning its own gas supply?"

Q. That is right.

A. I say that to me it is a little bit different because if Colorado Interstate owned 100 per cent of Canadian River, I would agree with you; it would be for practical purposes another thing, although there might be another corporate entity. Here Colorado Interstate doesn't own Canadian River at all. It is 42-½ per cent of the stock that is owned by a company which owns 100 per cent of Canadian River, or thereabouts, or there could be a conflict of interests arise that would be very different than if the situation were perfectly simple in that Colorado Interstate owned its Canadian River stock 100 per cent; if they owned 100 per cent of the Public Service Company and 100 per cent of Pueblo Gas and Fuel Company, and if they had no security outstanding, it would be a clean operating company to my mind.

Q. You say there might be a conflict of interest?

A. I would think so.

Q. Do you know of any that has occurred since the project has been in operation?

A. No, sir.

(Vol. XX, pp. 2860-2863.)

Further Testimony of the Commission's Witness, Charles Knapp.

"A. I commenced work in the year 1920. By 1925 I had taken business courses and completed my high school education through attendance at evening classes. In the fall of 1927 I entered the University of Vermont and studied for the degree of Bachelor of Arts and graduated with that degree in 1931. I majored there in languages and philosophy and was elected to membership in Phi Beta Kappa in my junior year. Following graduation I studied accounting, sat for the C.P.A. examinations and in 1934 obtained a certificate from the State of New York as a certi-

fied public accountant. I am a member of the New York State Society of Certified Public Accountants.

"My experience began in 1921, when I was employed by Babcock and Wilcox Company as a cost ledger clerk. Thereafter I became bookkeeper for a wholesale lumber concern. In January 1925 I obtained employment with Peat, Marwick, Mitchell and Company as a junior accountant, and later during the same year worked on the staff of a smaller public accounting firm, and afterwards as bookkeeper for a silk manufacturing concern. The following year, I was again employed by Peat, Marwick, Mitchell and Company in their income tax department for approximately a year, and then accepted a position as an accountant for a large wholesale bakery company, which position I resigned in the fall of 1927 when I entered college.

"For three years while attending college I was employed on the staff of the firm of Francis C. Derby Company, public accountants in Burlington, Vermont, and continued with that firm for over a year after graduation. In the fall of 1932 I was employed by the firm of Arthur Anderson & Co., as a semi-senior accountant, but shortly thereafter my status was changed to that of senior accountant. In the fall of 1933 and thereafter while with Arthur Anderson & Co., I was in charge of audits of the eastern telephone operating subsidiaries of probably the largest independent system of telephone utility companies in the country, and was also in charge of holding and sub-holding company audits and consolidation work for that system. I was also engaged on audits of electric, gas and water utilities during the same period.

"In the fall of 1935 I was employed as an accounting expert by the Federal Communications Commission on its investigation of American Telephone and Telegraph Company. While with that Commission I made an analysis of the principles and methods of consolidation employed in preparation of the published financial statements of the Bell System. I also prepared historical analyses and reports on investments of American Telephone and Telegraph Company in its telephone operating subsidiaries, and collaborated in the preparation of a report on the financial

history of the Western Electric Company, together with other studies and reports.

"In June of 1937 the telephone investigation was terminated and I obtained employment as a senior accountant with the public accounting firm of Allen R. Smart and Company. While employed by this firm I was in charge of the annual audit of United Aircraft Corporation and subsidiaries for the year 1937, and conducted a comprehensive investigation of that client's system of internal control.

"In April of 1938 I resigned to engage in private business as a public accountant, and in December 1938 accepted my present position with the Federal Power Commission. Since that time I have been employed in the Division of Finance and Statistics of the Bureau of Accounts, Finance and Rates with the title of Principal Examiner of Accounts and have been engaged in the study and preparation of reports on accounting and financial aspects of applications filed with the Commission in connection with sales of properties, mergers and consolidations and issuance of securities.

"I have also been engaged in studies and in the preparation of exhibits on the subject of rate and return and have testified as a witness for the Commission on this subject in five rate proceedings, namely, the Safe Harbor Water Power Corporation, Docket No. IT-5494, the Natural Gas Pipeline Company of America and Texoma Natural Gas Company, Docket Nos. G-109 and G-112, the Moline-Rock Island Manufacturing Company, Docket No. IT-5517, the New York State Natural Gas Corporation, Docket Nos. G-114 and G-125, and Chicago District Electric Generating Corporation, Docket No. IT-5500."

(Vol. LXXIV, pp. 10795-10798.)

* * * * *

A. "Introduction

I have been instructed to prepare a rate of return study setting forth the more important facts and factors which should be considered in arriving at a fair and reasonable rate of return for the Canadian River Gas Company, Colorado Interstate Gas Company and Colorado-Wyoming Gas Company.

Definition of "Rate of Return."

The "return" received by a public utility consists of the amount of revenue remaining after deduction of necessary and reasonable operating expenses, rents, taxes, and depreciation and amortization accruals, but before provision for interest, dividends, or additions to corporate surplus. This "return" is ordinarily conceived as the product of a "Rate base" times a given "rate of return." Conversely, the "Rate of Return" may be defined as that percentage rate which, when applied to the rate base, will yield the total, over-all return for the particular utility.

Statement of Principles.

It is generally conceded that the basic principles to be considered in determining the reasonableness of a particular rate of return were stated by the Supreme Court in the general rule laid down in the Bluefield decision as follows:

"What annual rate will constitute just compensation depends upon many circumstances and must be determined by the exercise of a fair and enlightened judgment, having regard to all relevant facts. A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and enable it to raise the money necessary for the proper discharge of its public duties. A rate of return may be reasonable at one time and become too high or too low by changes affecting opportunities for investment, the money market and business conditions generally."

Another fundamental principle was stated by the Supreme Court in United Railways v. West in the following

words: "'What will constitute a fair return in a given case is not capable of exact mathematical demonstration.'"

Although other factors doubtless have been considered by various courts and commissions, the underlying principles to be considered in connection with the problem of rate of return are probably nearly all covered in the above citations from holdings of the Supreme Court.

Identification of Rate of Return Study.

Based on consideration of the underlying principles set forth above, I have made certain studies and have either prepared or have directed and supervised the preparation of certain charts and schedules which have been assembled in two bound volumes, designated as Part I and Part II, respectively, for presentation in the present proceedings as exhibits entitled "Rate of Return Study."

Part I contains data on general interest rates and yields, utility interest rates and yields and recent financing, general economic conditions, comparative stability of earnings of public utilities and other forms of enterprise, local conditions in the general area of ultimate consumption of natural gas supplied through the pipe line facilities of the companies involved in the present proceedings, and data reflecting the present situation with respect to idle investment funds and the factors contributing thereto.

Part II of the rate of return study, besides containing some general statistics of the natural gas industry, presents facts concerning the ownership, issuance, prices and yields of securities of natural gas pipe line companies.

(Vol. LXXIV, pp. 10800-10803.)

General Interest Rates and Yields.

Moody's Investors Service publishes a considerable amount of financial data and its publications are accepted and relied upon generally for purposes such as are now being considered. Chart 1 shows Moody's composite bond yield average based on bonds of 120 domestic corporations which carry the four highest bond ratings assigned by Moody's publication. The chart also shows the average

yield for the 30 bonds included in each of the four rating groups, namely, Aaa, Aa, A and Baa. There are not always 120 corporations in Moody's compilation and there are not 120 corporations at this time, principally because of the difficulty of finding industrial bonds of the higher ratings.

Chart 1—Chart 1 reflects the range of bond yield averages since 1920. The composite average yield for all bonds included in the data had reached by the end of 1936 the lowest level recorded since 1920, namely, 3.67 per cent. After rising during 1937 and the early part of 1938 to 4.50 per cent in April 1938, a decline took place which, by August 1939, had carried the composite average down to the 1936 low point.

The month of September witnessed a sharp rise resulting from the outbreak of war in Europe. The composite average moved from 3.67 per cent to 3.95 per cent in that month. Between September 1939 and the year-end, the average declined to the August level.

From December of last year through April of this year the composite average declined from 3.69 per cent to 3.54 per cent. Following the invasion of the Low Countries in May, however, the increase in bond yields brought the average for May to 3.67 per cent, and for June to 3.72 per cent. By August the average had declined to the April level, and for September the composite yield was at a record low point of 3.50 per cent.

Since Chart 1 shows the individual rating group averages from which the composite average is derived, it can be seen that by September 1940 the average yields for bonds of Aaa, Aa and A rating, after advancing about 0.10 per cent in May and June, had also declined to new low levels, these being considerably lower than the levels established in 1936. For example, the low points in 1936 as compared with the yields shown for September 1940, are as follows:

Aaa bonds, 1936—3.10 per cent; September 1940—2.82 per cent;

Aa bonds, 1936—3.28 per cent, September 1940—3.01 per cent;

A bonds, 1936—3.78 per cent, September 1940—3.52 per cent.

On the other hand, the risk factor associated with bonds of Baa rating is reflected by the more pronounced rise in the average yield on such bonds commencing in the latter part of 1937 and culminating in the early part of 1938 than was the case for bonds of higher rating.

The 1936 low point for Baa bonds was 4.52 per cent, the yield subsequently rising to 5.16 per cent in September, 1937, and to 6.47 per cent in April 1938. The yield declined rapidly during the remainder of 1938 to 5.27 per cent in December 1938.

During 1939 the average yield on Baa bonds declined still further but, in December 1939, at 4.92 per cent was still 0.40 per cent above the 1936 low point, in contrast with the experience of bonds of higher grade. The average yield on Baa bonds continued to decline during the first four months of 1940, but in May increased sharply by 0.20 per cent and in June advanced 0.17 per cent, resulting in a rise of 0.37 per cent over the April average.

This rise compares with that of about 0.10 per cent in the average yield for the higher grade bonds in the same two-months period. From June to September, the Baa average reflected a more substantial decline than was recorded for higher grade bonds with the result that the September average of 4.66 per cent was only 0.14 per cent above the 1936 low point, a decline of 0.26 per cent from the average for December 1939.

Also reflected by Chart 1 is the virtual collapse of the bond market which occurred in 1931 and the continuation of an extreme degree of weakness thereafter for the greater part of three years. In this period bonds most severely affected were those regarded as subject to greater investor risk. It will be observed, for example, that while the yields for Baa and A bonds reached 11.63 per cent and 8.5 per cent, respectively, in this period, the highest yield recorded for Aa bonds was 6.60 per cent and for Aaa bonds was only 5.41 per cent.

The data upon which Chart 1 is based appear in Sched-

ule 1 which will be found immediately following the chart. Page 1 of Schedule 1 contains the composite monthly and annual average yields for each year commencing with the year 1920 on bonds of 120 domestic corporations including bonds of the four highest Moody bond rating groups, namely, Aaa, Aa, A and Baa.

Similarly, Page 2 contains the average yield on bonds of Aaa rating, Page 3 on bonds of Aa rating, Page 4 on bonds of A rating and Page 5 on bonds of Baa rating. Each rating group includes, so far as they are available for inclusion, 30 domestic corporation bonds.

A footnote on Page 5 indicates the source from which the data were taken. The lines on the chart can be readily associated with the data contained in the schedule. For example, Page 1 of Schedule 1 shows that the composite yield on bonds of 120 domestic corporations was 4.50 per cent in April 1938, as reflected on Chart 1.

Page 6 describes the mathematical basis of the yield computations. Monthly yield averages are unweighted arithmetic averages of daily yields computed on the basis of closing prices and calculated to maturity dates. For each rating group the average is based on the bonds included in that group and the composite average is the average of the four rating group averages.

Commencing on Page 6 and continuing on Page 7 of Schedule 1 will be found the key to Mood.'s bond ratings. For example, bonds of Aaa rating are those judged as representing bonds of the best quality, generally referred to as "gilt edge" because they carry the smallest degree of investment risk. Interest payments on such bonds are protected by large or exceptionally stable margins, changes in which are most unlikely to impair the fundamentally strong position of such issues, and principal is secure.

Bonds of Aa rating rank high but lack one characteristic or another of the highest type of bond investment. Together with the Aaa group they comprise what are generally known as high grade bonds. Bonds carrying the A rating possess many favorable investment attributes and are to be considered as higher medium grade obligations. Baa bonds are those considered as lower medium grade ob-

ligations, i. e., they are neither highly protected nor poorly secured. Such bonds, besides lacking outstanding investment characteristics, in fact exhibit speculative characteristics as well.

Pages 8 to 11, inclusive, of Schedule 1 contain lists of the bonds currently used in Moody's bond yield averages according to rating groups. Aaa bonds, grouped according to classification as Industrials, Railroads and Public Utilities are listed on Page 8, Aa bonds are similarly listed on Page 9, A bonds on Page 10 and Baa bonds on Page 11.

It will be noted that the lists of Industrial Aaa and Aa bonds contain fewer than ten bonds, there being only four bonds in the Aaa group, and four in the Aa group. Similarly, there are only five Railroad bonds in the Aaa group. Moody's explanation, as given on Page 6 of Schedule 1, is that it has not been possible since 1933 to find a sufficient number of representative bonds for these rating groups. However, as previously indicated, the averages for these groups are given equal weighting in combining them with other group averages.

Chart 2—The purpose of the next two charts is to show that the trend of bond yields is not an isolated phenomenon but is part of the movement of interest rates in general, as indicated by the broadly similar patterns observed in the trend of interest rates on 4-6 months commercial paper and on 60-90 day time loans, as well as in the yields on U. S. Treasury bonds. In other words, the purpose of these two charts is merely to furnish added data regarding the movement of interest rates as such, and not to offer short-term money rates or yields on Treasury Bonds, as a measure of a proper rate of return.

(Vol. LXXIV, pp. 10805-10811.)

Chart 3—Chart 3 shows the yield on U. S. Treasury Bonds due or callable after twelve years, as computed by the U. S. Treasury Department for the period since 1920. This chart portrays a somewhat similar situation as that shown on Charts 1 and 2, the trend being generally downward in recent years.

The low point for the period 1920-1936 was reached about

the end of 1936 with a yield of 2.51 per cent, as indicated in Schedule 3. Increasing by April 1937 to 2.80 per cent, the yield subsequently declined, reaching a record low of 2.13 per cent in June 1939.

In September, 1939, as in the case of domestic corporation bonds, the yield on U. S. Treasury Bonds reached the highest level of the year, 2.65 per cent, but subsequently declined and for the month of December 1939 was 2.35 per cent. The decline continued in 1940 and in March and April the yield averaged 2.25 per cent. An increase of 0.13 per cent occurred in May 1939, in line with the increase previously noted for corporate bonds in the Aaa, Aa and A groups, but this increase was later cancelled and in August the average again stood at 2.25 per cent. For the month of September, not shown on the chart, the average was 2.18 per cent, and for the week ending October 19, 1940, it was 2.09 per cent, indicating a decline to new low levels.

Undoubtedly the lower yield recorded for Treasury bonds in comparison with Moody's average yield on corporation bonds of Aaa rating may be attributed to the low risk associated with these securities and to the fact that income derived therefrom is in part exempt from taxation.

From the data presented in this section, it is apparent that in recent months interest rates and yields, generally, have reached the lowest levels witnessed in many years; in fact, they probably have not been lower at any time in the history of the country.

Utility Interest Rates and Yields and Recent Financing.

"This section deals with the cost of money as indicated by bond yields, pefferred stock yields, and common stock earnings-price ratios, with particular reference to public utilities.

Chart 4—Chart 4 shows Moody's bond yield averages, commencing with the year 1934, based on the bonds of 40 public utilities according to Moody's bond ratings. In contrast with Chart 1, which shows declines in yield below the 1936 level only for domestic corporation bonds of the three highest Moody's rating groups, Aaa, Aa, and A, Chart 4 shows declines below that level through September 1940

for public utility bonds of all four rating groups. The September 1940 yield averages for public utility bonds in the respective rating groups, as shown in Schedule 4, Pages 1 and 2, are as follows:

Aaa—2.74 per cent, Aa—2.88 per cent, A—3.18 per cent, and Baa—3.94 per cent.

Chart 4 is supported by Schedule 4. The companies whose issues are currently used in computing the average yield shown on the chart are listed in Page 3 of the schedule.

It will be noted by inspection of the annual averages shown on Pages 1 and 2 of Schedule 4 that the average yield on public utility bonds in each rating group declined substantially between 1934 and 1939, the comparative yields and declines being as follows:

Aaa—1934 average, 3.92 per cent—1939 average, 2.88 per cent, a decline of 1.04 per cent; Aa—1934 average, 4.66 per cent—1939 average, 3.03 per cent, a decline of 1.63 per cent; A—1934 average, 5.55 per cent—1939 average, 3.52 per cent, a decline of 2.03 per cent; Baa—1934 average, 7.49 per cent—1939 average, 4.50 per cent, a decline of 2.99 per cent.

Relatively these declines range from 26.5 per cent for Aaa bonds to 40 per cent for Baa bonds, indicating that investors in public utility bonds have more recently been willing to accept a relatively lower rate of compensation than in 1934 in proportion to the degree of risk assumed.

Another method of measuring the willingness of investors to accept relatively less compensation in proportion to the degree of risk assumed is to compare the ratio of the yield on Baa bonds to that on Aaa bonds. Such ratios computed for the years 1934 to 1939, inclusive, and for the month of September 1940 are as follows:

Period	Baa Yield	Aaa Yield	Ratio of Baa to Aaa Yield
Year 1934	7.40 per cent	3.92 per cent	1.91
Year 1935	5.56 per cent	3.52 per cent	1.58
Year 1936	4.67 per cent	3.21 per cent	1.45
Year 1937	5.09 per cent	3.21 per cent	1.59
Year 1938	5.26 per cent	3.03 per cent	1.74
Year 1939	4.50 per cent	2.88 per cent	1.56
Sept. 1940	3.94 per cent	2.74 per cent	1.44

From the foregoing, it appears that in 1934 the yield demanded by investors on Baa bonds was 1.91 times that required on Aaa bonds. The ratio declined to 1.45 in 1936, increased to 1.74 in 1938, and dropped back to 1.56 in 1939.

In September 1940, the ratio stood at approximately the same low level for the period as that recorded in 1936.

Chart 5—Chart 5 shows Moody's bond yield averages for the periods since 1920 based on bonds of 120 domestic corporations classified into three groups, namely, railroads, public utilities and industrials. The general trends reflected in this chart are similar to those described in connection with the previous charts.

Starting from the low point for all groups reached in 1936, the average yields increased until midyear of 1938. The rise in yield for railroad bonds in this period was much more abrupt than in the case of public utilities and industrials and carried the yield on railroad bonds to 5.75 per cent, public utility yields increasing only to 4.11 per cent and industrials to 3.55 per cent.

From these points the trend toward lower yields has continued with minor interruptions for all groups, but only in the case of public utilities and industrials have the yields established new low levels. For example, the August 1939 figures were 3.40 per cent (1936—3.69 per cent) for public utilities and 3.21 per cent (1936—3.37 per cent) for industrials.

Railroad yields in August averaged 4.41 per cent, which was still considerably higher than the 3.95 per cent yield recorded for January 1937, reflecting the greater degree of

risk attaching to railroad securities from the viewpoint of investors. The rise in yields which occurred in September 1939 had been cancelled before the year-end, and subsequently through April 1940 all yields registered further declines, public utility and industrial bond yields falling to the then lowest levels on record, while railroad bond yields still remained 0.38 per cent above the January 1937 low point.

In May and June, following the invasion of the low Countries an abrupt rise in yields of all bonds occurred, but this rise was subsequently cancelled, except in the case of industrial bonds, railroad bond yields declining through September to a level only 0.28 per cent above the previous low point in the period since 1920, while public utility bond yields were established at the lowest level on record. The September 1940 averages, as shown in Schedule 5, Pages 1, 2 and 3, were as follows:

Industrials—3.10 per cent, Public Utilities—3.19 per cent and Railroads—4.23 per cent.

By inspection of the annual averages shown on Page 2 of Schedule 5, it will be seen that the average yield on 40 public utility bonds declined from 6.30 per cent in 1932 to 4.43 per cent in 1935, and levelled off at approximately 3.90 per cent during the years 1936, 1937 and 1938. For 1939 the average was lower, at 3.48 per cent, than for any year since 1920, while the average for the first nine months of 1940, 3.28 per cent, as well below the 1939 average.

Chart 5 indicates that the experience of the industrial group has been somewhat more favorable than that of the public utilities, especially in recent years, but this may be due in part to the limited number of industrial bond issues available for inclusion in the two highest Moody bond rating groups.

Schedule 5 gives the monthly and annual average yields for the three groups of corporation bonds on which Chart 5 is based, together with a list of the bonds currently included in the groups.

Chart 6—Chart 6 shows annually, for the period since 1921, Moody's weighted averages of yields on newly issued

domestic bonds of industrials, railroads, and utilities. The averages shown are based on yields at offering prices of newly issued bonds, calculated to maturity and weighted by the amounts of all new issues floated in any given classification or period. The classification "utility bonds," which includes bonds of light, power, and gas utilities, consists wholly of operating companies. The yields indicated in Chart 6 are not, of course, representative of bonds of the same companies or issues at any one date or during any given period."

This chart shows a generally downward trend since 1921 for all classes of companies in yields on newly issued bonds. The trend was interrupted in 1929 and 1932, but commencing in 1933 and continuing until about 1936 the downward trend was greatly accelerated. In 1937 and 1938 the yields leveled off somewhat, but in 1939 a substantial decline occurred, particularly in yields on new railroad and industrial bond issues.

The 1939 decline in yield on newly issued light, power, and gas utility bonds was fractional, but nevertheless brought that yield also to the lowest point reached throughout the entire period since 1921. There has been superimposed on Chart 6 from Schedule 10 the average yield on newly issued bonds of electric operating utilities beginning with the year 1935, which shows a somewhat more favorable market for bonds of electric operating utilities than for those of light, power, and gas utilities combined.

The chart indicates that from 1921 through 1932 the market for new utility bonds appears to have been somewhat less favorable than for railroad bonds. In 1933, however, this position was reversed and except in the years 1937 and 1938, utility bonds were marketed from 1933 through 1939 on more favorable terms than railroad bonds.

It also appears that from 1921 through 1938 the market for new utility bond issues was consistently more favorable than for industrial issues. A reversal of this situation occurred in 1939 when the average yield on new utility bond issues was 3.45 per cent, as compared with 3.09 per cent on new industrial issues. In this connection, however, attention is directed to Page 1 of Schedule 10 where it is indi-

cated that in 1939 a substantially larger proportion of electric operating utility bond issues consisted of lower medium grade bonds of Baa rating than was the case in prior years, which would appear to account, at least in part, for the failure of the yield on new utility bond issues to follow the yield on industrial issues in that year.

The rapid decline in the yield on newly issued domestic bonds, particularly noticeable since 1934, suggested that the decline could be attributed not only to the course of the bond market itself but also to the quality of the offerings. This assumption is confirmed by comparison of the average yield for newly issued utility bonds with the average yield on utility bonds then outstanding of the three highest Moody bond rating groups, i. e., Aaa, Aa, and A.

The line superimposed on Chart 6, showing the average annual yield from 1934 to 1939 on 30 utility bonds carrying these Moody ratings, very closely conforms to that showing the yield on newly issued utility bonds, except in 1939 for the reason above noted, and indicates that a very large proportion of the utility bonds offered during that period consisted of higher grade bonds.

Schedule 7—This schedule reflects annual yields on a group of electric operating utility preferred stocks during the period of eleven years from 1929 to 1939, inclusive, based on averages of yearly high and low market quotations. The issues included in this exhibit comprise all electric operating utility preferred stocks shown in Schedule 19 of a Federal Communications Commission publication issued June 15, 1938, for which preferred dividends and prior requirements were earned in excess of 1.50 times in 1938, and for which market quotations for each year in the period 1929-1939 were available. The title of the publication referred to is "The Problem of the 'Rate of Return' in Public Utility Regulation."

Schedule 7 reflects a definite upward trend through 1933 in yields demanded by investors on preferred stocks, and a definite downward trend in the years 1934, 1935 and 1936. After 1936 investors' demands fluctuated within a narrow range at approximately the 1936 level. Expressed in terms of an index based on the 1929 average of the yields on the

16 preferred stocks as equal to 100 per cent, the average yield advanced to 106 in 1931, to 117 in 1932, and to 140 in 1933. In 1934 the average declined to 125, and fell to 103 in 1935. In 1936 the average was about 15 points lower at 88 and, with minor fluctuations in the years 1937 and 1938, stood at 86 in 1939, for which year the average yield demanded by investors was lower than for any other in the 11-year period.

Expressed in terms of per cent yield, the unweighted arithmetic average yield on the 16 preferred stocks increased from 5.74 per cent to 8.04 per cent between 1929 and 1933, declined to 5.10 per cent between 1933 and 1936, and was 5.19 per cent for 1937, 5.27 per cent for 1938 and 4.96 per cent for 1939.

Schedule 7-A.—This schedule reflects yields on electric operating utility preferred stocks and number of times preferred dividends and prior requirements are earned based on averages of high and low market quotations for the first nine months of 1940, with earnings coverage based on income for the latest twelve months for which reported.

Schedule 7-A contains a list of 22 preferred stocks and, as indicated in the footnote, includes all electric operating utility preferred stocks shown in Schedule 19 of the previously mentioned publication of the Federal Communications Commission, for which preferred dividends and prior requirements were earned in excess of 1.50 times in 1938.

Examination of this schedule will show that of the 22 preferred stocks listed, two issues were selling to yield from 3.90 per cent to 4.00 per cent to investors, three issues to yield between 4.00 per cent and 4.25 per cent, four issues to yield between 4.25 per cent and 4.50 per cent, four issues to yield from 4.50 per cent to 5.00 per cent, five issues to yield between 5.00 per cent and 5.50 per cent and four issues to yield from 5.50 per cent to 6.02 percent. In no instance did any issue sell on a basis to yield in excess of 6.02 per cent. Twelve of the 22 issues reflected yields of 4.74 per cent or lower on the basis indicated. For eight of these twelve issues, preferred dividends and prior requirements were earned in excess of 2.50 times, and with respect to eight of the issues yielding in excess of 4.74 per cent such requirements were earned less than two times.

The unweighted arithmetic average of yields on the 22 preferred stock issues shown in Schedule 7-A is 4.82 per cent, as compared with 1939 average of 4.96 per cent for the 16 issues shown in Schedule 7. The nine-months average of 4.87 per cent for the 16 issues in Schedule 7 which are also included in Schedule 7-A reflects a continuation in 1940 of a somewhat downward tendency in electric operating utility preferred stock yields.

Schedule 8—This schedule reflects annual earnings-price ratios, that is, the per cent of net earnings per share to market price, on a group of electric operating utility common stocks during the period of eleven years from 1929 to 1939, inclusive, based on averages of yearly high and low market quotations and published annual earnings per share of common stock. The issues included in the exhibit comprise all electric operating utility common stocks shown in Schedule 26 of the previously mentioned publication of the Federal Communications Commission issued June 15, 1938. The stocks listed from such publication include only those common stocks which are held by the public to the extent of at least 5 per cent of the number of shares outstanding.

Schedule 8 reveals that, on the average, from 1929 through 1932 there was a definite upward trend in common stock earnings-price ratios on these common stocks. In other words, during this period, investors demanded that increasing earnings be available for common stock per dollar of market price. In terms of an unweighted arithmetic average, the average earnings-price ratio for the group of 14 common stocks was 4.06 per cent in 1929, and increased in the three succeeding years, rising to 4.59 per cent in 1930, to 5.95 per cent in 1931, and to 7.74 per cent in 1932, the latter ratio being the highest reflected in any year during the eleven-year period.

In 1933, investors' demands abated somewhat, the average earnings-price ratio declining to 7.02 per cent. In 1934 the ratio rose to 7.57 per cent, but declined to 7.32 per cent in 1935 and to 5.89 per cent in 1936. In 1937 and 1938 the ratio advanced to 6.77 per cent and 7.42 per cent, respectively, but in 1939 declined again and was 7.04 per cent for that year.

It will be observed that during the eleven-year period the average did not exceed eight per cent in any year. Aside form the two years 1929 and 1930 for which the average was less than five per cent, there were two years for which the average was less than six per cent, one year 1937, for which it was 6.77 per cent, and five years for which the average was above 7 per cent, the highest average, as above stated, being 7.74 per cent in 1932. The simple average ratio for the last four years of the period was 6.78 per cent.

Schedule 8-A—This schedule reflects earnings-price ratios of electric operating utility common stocks and the per cent of gross income available for common stock based on averages of high and low market quotations for the first nine months of 1940, and on twelve-months' earnings per share as published in the latest quarterly reports.

Schedule 8-A contains a list of 14 common stocks and, as indicated in the footnote, includes all electric operating utility common stocks listed in Schedule 26 of the previously mentioned publication of the Federal Communications Commission, of which at least five per cent of the issue was outstanding in the hands of the public.

Inspection of data contained in this schedule will show that the earnings-price ratios of the 14 common stocks listed were as follows: one at 4.98 per cent, one at 5.65 per cent, three from 6.00 per cent to 7.00 per cent, five between 7.00 per cent and 7.75 per cent, two at 8.00 per cent, one at 8.67 per cent, and one at 9.31 per cent. Ten of the fourteen issues reflected earnings-price ratios of less than 7.75 per cent on the basis indicated. It will be noted that for three issues selling on a basis of 8 per cent or more the proportion of gross income available for common stock falls below 50 per cent.

The unweighted arithmetic average of the earnings-price ratios of the fourteen common-stock issues shown in Schedule 8-A is 7.29 per cent, as compared with 1939 average of 7.04 per cent and the 1938 average of 7.42 per cent for the same issues shown in Schedule 8.

Schedule 9—Schedule 9 presents annual information on the volume of all corporate financing in the United States since 1934, and the portion thereof representing financing

by public utilities, as compiled by The Commercial & Financial Chronicle. The total volume of financing in each year is segregated to show the portions representing new capital and refunding issues, and subdivisions of the amounts representing new capital, refunding and total corporate financing disclose the proportionate amounts of long-term bonds and notes, short-term bonds and notes, preferred stock and common stock issues comprising the total, both for all corporate issues in the United States and for the portion thereof representing security issues of public utilities.

The total amount of new corporate issues in the United States during 1934 was 491 million dollars, for 1935—2,267 millions, for 1936—4,632 millions, for 1937—2,434 millions, for 1938—2,139 millions, for 1939—2,479 millions, and for the first nine months of 1940—1,674 millions, the total for the entire period being 15,816 millions. Of this total, 7,596 millions, or 48 per cent, represented financing by public utilities. By years the proportions of the total of public utility security issues to all corporate issues in the United States were: 1934—32.3 per cent, 1935—56.6 per cent, 1936—45.9 per cent, 1937—34.0 per cent, 1938—57.2 per cent, 1939—60.5 per cent, and 1940 through September 29.4 per cent.

In this connection, attention is directed to Note 3 on Page 4 of Schedule 9 which indicates that The Commercial and Financial Chronicle, which is the source of the above data on corporate financing, does not classify non-retailing natural gas pipe line companies as public utilities. Securities issued by such natural gas companies are reported by that publication under the heading "Miscellaneous."

The proportion of the total amount of all corporate financing during the period from 1934 to date represented by new capital was 29.8 per cent. New capital accounted for 11.3 per cent of all public utility financing during the same period. By new capital, in this connection, is meant capital obtained for the purpose of additions to plant and property or to increase working capital. By refunding is meant the issuance of new securities for the purpose of retiring existing obligations at or before maturity, or of effecting reductions in dividend rates on preferred stocks.

New capital raised by corporations in the United States during the period from 1934 to date aggregated 4,710 million dollars of which public utility issues accounted for 855 millions, or 18.2 per cent. Of this 855 millions of new capital raised by public utilities, 94.3 per cent was represented by bonds and notes, 4.7 per cent by preferred stocks, and 1.0 per cent by common stocks, whereas the corresponding percentages of new capital obtained from all corporate issues were, for bond and notes—76.1 per cent, for preferred stocks—10.2 per cent, and for common stocks—13.7 per cent.

The total amount of all corporate issues for refunding purposes during the same period was 11,106 million dollars of which public utility issues accounted for 6,741 millions, or 60.7 per cent. This clearly demonstrates that public utilities have taken advantage of the favorable market in recent years to conduct large-scale refunding operations. In 1939 public utility issues accounted for 70 per cent of all corporate securities issued for refunding purposes. In 1938 the percentage accounted for by public utilities was somewhat higher, at 75 per cent, but was based on public utility refunding issues aggregating 950 millions, as compared with 1,261 millions in 1939.

Public utility financing during the period since 1934 accounted for the following proportions of all corporate issues: long-term bonds and notes, maturing later than five years from date of issue—7,007 millions, or 52.7 per cent of all long-term corporate issues; short-term bonds and notes—158 millions, or 32.5 per cent of all short-term corporate issues; preferred stocks—412 millions, or 32.4 per cent of all preferred stock issues; and common stocks—20 millions, or 2.7 per cent of all common stock issues.

As previously stated, public utility issues of all kinds accounted for 48 per cent of all corporate issues over the entire period under discussion. However, during the years 1937 and 1938 public utility financing accounted for very nearly 60 per cent of all corporate financing in the United States.

Analysis of the various types of securities issued by public utilities during the period covered by Schedule 9 reveals that there were no capital stock issues sold in 1934. Small

amounts of preferred and common stock representing new capital were sold in 1935, approximately $4,500,000 of preferred but no common stock issues representing new capital were sold in 1936, approximately $5,700,000 of preferred stock issues and $700,000 of common stock issues representing new capital were sold in 1937; no common stock issues were sold in 1938 and only $300,000 was raised from the sale of common stock in 1939.

In contrast with this record, Page 5 of Schedule 9 reflects the sale of approximately $6,600,000 of common stock and $18,500,000 of preferred stock representing new capital in the first nine months of 1940. The combined total of such issues in 1940 is somewhat in excess of the aggregate of all preferred and common stock issued for new capital purposes during the entire preceding six-year period.

Schedule 10—This schedule contains a summary of all known electric operating utility bond issues, other than bonds and debentures having serial maturities, sold during the years 1935 to 1939, inclusive, and shows that during this period 276 such bond issues were sold aggregating in excess of four and one-half billion dollars. The summary on Page 1 is presented by years and discloses the following weighted average yields on newly issued electric operating utility bonds based on offering prices to purchasers: 1935—3.81 per cent, 1936—3.48 per cent, 1937—3.63 per cent, 1938—3.43 per cent, and 1939—also 3.43 per cent. The weighted average yield on all issues sold during the five-year period, irrespective of rating, was 3.55 per cent.

Page 2 of Schedule 10 reflects average yields on the same bond issues classified according to ratings assigned by Moody's publications. It is there shown that 104 issues, or approximately 38 per cent of the total number sold during the five-year period, represented bonds of Aaa and Aa rating and 91 issues represented bonds of A and Baa rating. However, it will be observed that in 1939 only one Aaa issue and three Aa issues were sold in contrast with the larger number of such issues sold in previous years. On the other hand, about one-fourth of the 49 issues sold in 1939 represented bonds of Baa rating and one-fifth represented bonds of A rating, bonds of these two rating groups thus accounting for approximately one-half of the number of electric operating utility bond issues sold in 1939.

The summary on Page 2 of Schedule 10 also discloses that average yields to purchasers have declined since 1936. With respect to bonds carrying the four highest Moody's ratings, yields on issues sold in 1939 were lower than in any other year of the five-year period, such yields being as follows: Aaa—2.75 per cent, Aa—3.08 per cent, A—3.31 per cent, and Baa—3.87 per cent.

Of the 276 issues included in the summary for the five-year period, 74 were issues to which no rating was assigned by Moody's publications. The majority of such issues represented bonds which were privately sold. No rating is ordinarily assigned to bonds which are sold privately inasmuch as there is usually no trading in such issues.

Schedule 10-A—This schedule contains certain details in connection with offerings of electric operating utility bond issues sold during the year 1939. Such offerings aggregated approximately $800,000,000 in principal amount. The weighted average yield to purchasers of these issues was 3.43 per cent.

On Page 1 will be noted an issue of Public Service Company of Colorado, 3-½ per cent first mortgage bonds, due 1964, Rating A, in the principal amount of $40,000,000, which were offered to the public in November 1939, at 102, resulting in a yield to maturity of 3.38 per cent.

There is shown on Page 2 the ten-year 4 per cent Debenture issue of that company, Rating Baa, in the principal amount of $12,500,000, which was also offered to the public in November 1939 at 102, the yield to maturity in this instance being 3.76 per cent.

Schedule 10-B—Schedule 10-B contains a list of all electric operating utility bond issues sold during the first nine months of 1940. The aggregate principal amount of such issues was $419,337,300. There were 40 issues sold during this period, including one Aaa issue sold in July on a 2.73 per cent yield basis, four Aa issues at an average yield of 2.93 per cent, six A issues sold to yield an average of 3.17 per cent, five Baa issues on which the average yield was 3.81 per cent, and two Ba issues sold at an average yield of 4.37 per cent. Twenty-two issues, to which no rating

was assigned, were sold in this period of which all but one were sold privately. The weighted average yield of all issues sold was 3.29 per cent, which figure was somewhat lower than the average of 3.43 per cent on newly issued electric operating utility bonds sold during the years 1938 and 1939.

Schedule 11—Schedule 11 represents a compilation of all known preferred stock issues of electric operating utility companies sold in the period 1935-1939, showing the cost of money to issuing companies and yields to purchasers. The average yield to purchasers of such issues was 4.38 per cent for 1935, 4.62 per cent for 1936, 4.63 per cent for 1937, 4.85 per cent for 1938, and 4.99 per cent for 1939. Yields on individual issues in excess of $1,000,000 ranged from 4.09 per cent to 5.95 per cent. For the entire period, the average yield on all issues sold was 4.64 per cent.

Comparison with Schedule 10 indicates the relatively low proportion of preferred stock to bonds issued by electric utilities during the five-year period, new issues of bonds and preferred stock having been sold in proportions of about 25 to 1. However, it should not be inferred that such a relationship exists between outstanding bonds and preferred stocks in the capital structure of electric operating utilities.

For example, in the volume entitled "Statistics of Electric Utilities in the United States—1938," published by the Federal Power Commission, it is shown on Page IX that for 393 Class A and Class B privately owned electric utilities, long-term debt constituted 52.2 per cent of the total amount of securities outstanding as of December 31, 1938, while preferred stocks comprised 15.4 per cent of the total. In addition, common stocks accounted for 31.6 per cent of the securities outstanding and the remainder, or 0.8 per cent, consisted of premiums, assessments, and so forth, on capital stock.

Schedule 11 shows for each issue the net proceeds per share realized by the issuing company from the sale of preferred stock as well as the offering price per share to the public. In addition, it shows the per cent relationship of annual dividends both to net proceeds and to price paid by public.

For example, a 4½ per cent preferred stock issue of Wisconsin Michigan Power Company was sold in December 1939 at par of $100 per share to yield 4.50 per cent to purchasers. The company realized $96.11 per share as the net proceeds from the sale after meeting all expenses of floating the issue, the dividend requirement of $4.50 per share representing an annual cost to the company for preferred stock capital of 4.68 per cent ($4.50 ÷ $96.11). The expenses of floating the issue therefore resulted in increasing the annual preferred stock expense of the company over the annual yield to purchasers by 0.18 per cent. Stated another way, the yield to purchasers, 4.50 per cent, plus cost of financing, 0.18 per cent, equals the annual cost to the company for preferred stock capital, 4.68 per cent.

Inspection of Schedule 14 reveals that the weighted average cost of financing in connection with electric operating utility preferred stock issues was 0.12 per cent in 1935 (4.50 per cent—4.38 per cent), 0.15 per cent in 1936 (4.77 per cent—4.62 per cent), 0.15 per cent in 1937 (4.78 per cent—4.63 per cent), 0.19 per cent in 1938 (5.04 per cent—4.85 per cent), and 0.22 per cent in 1939 (5.21 per cent—4.99 per cent).

Over the entire period 1935-1939, the weighted average cost of financing was 0.15 per cent (4.79 per cent—4.64 per cent). In 1939 the cost of financing for four preferred stock issues carrying a 4½ per cent dividend rate ranged from 0.07 per cent (Consolidated Gas Electric Light & Power Co. of Baltimore) to 0.19 per cent (Wisconsin Gas & Electric Co.). These four issues were sold at par or better to yield from 4.00 per cent to 4.50 per cent to purchasers.

Schedule 11-A—This schedule contains details of all known electric operating utility preferred stock issues sold to the public in the first nine months of 1940. The aggregate offering price of such issues was approximately $34,000,000, and the weighted average yield to purchasers was 4.41 per cent, a decline of 0.58 per cent from the corresponding average for the year 1939. It will be noted that a 4½ per cent issue of Consolidated Gas Electric Light & Power Co. of Baltimore was sold in August at four points above par to yield 3.85 per cent to purchasers.

Schedule 12—Schedule 12 contains details of all known offerings of electric operating utility common stocks during the period from 1935 through September 1940. Of the five issues listed in this schedule, three were offered to the public during March and April of the present year, the other two issues representing primarily offerings to stockholders in 1935 and 1937, respectively.

In contrast with Schedule 9, Page 5, which reflects the sale of $6,622,520 of new issues of common stock in the months of January to September 1940, Schedule 12 reflects common stock sales amounting to approximately $28,000,000 during the same period. By reference to the footnotes in Schedule 12 it will be seen that only the issue of West Penn Power Company ($4,320,000), and 68,855 shares of the Indianapolis Power & Light Company issue ($1,652,520) fall within the category of new issues. The difference between the sum of the foregoing amounts, $5,972,520, and the above total of $6,622,520 for common stock issues in 1940, is represented by an issue of common stock of Bridgeport Hydraulic Company, a non-electric utility, amounting to $650,000.

For each issue listed in Schedule 12 there are given the name of the issuing company, the offering date, the number of shares offered, the price to public in dollars per share and the aggregate amount paid by the public, together with the amount of the issuing company's annual earnings per share of common stock for the year preceding the offering date, the per cent of such earnings per share to offering price, and the per cent of gross income available for common stock in the years for which earnings per share are given.

The first issue in Schedule 12 is that of Boston Edison Company (formerly Edison Electric Illuminating Co. of Boston) comprising 82,289 shares of common stock offered to stockholders in the latter part of 1935 at a subscription price of $150 per share. Approximately 94 per cent of the shares offered were taken up by stockholders and the remaining shares were offered to the public at a price of $166 per share. The proceeds were used to retire a portion of the company's outstanding indebtedness. On the basis of earnings per share recorded for the years 1934

and 1935, the average offering price resulted in an earnings-price ratio of between 6.25 per cent and 6.43 per cent. The proportion of the company's gross income available for common stock was 56.85 per cent in 1934 and 61.68 per cent in 1935.

The second issue in Schedule 12 represents an offering to stockholders of Tampa Electric Company in November 1937 to purchase 31,497 shares of the company's common stock at a subscription price of $20 per share. The stockholders subscribed to 30,712 shares or approximately 97.5 per cent of the shares offered. On the basis of earnings per share recorded for 1936 and 1937, the offering price of $20 per share resulted in an earnings-price ratio of between 11.50 per cent and 11.65 per cent. In this connection it should be noted that the range of market quotations for Tampa Electric Company common stock in 1937 was 25-1/4—41. It is thus apparent that the price of $20 per share paid by stockholders was well below the then current market price.

The next three offerings listed in Schedule 12 were made in March and April of the present year. In March 1940 a block of 200,000 shares of Commonwealth Edison Company stock was offered to the public. It was reported that the offering price of 32-3/8 was based on the closing price for the stock on the New York Stock Exchange on March 6, 1940.

It is of interest to note that the price range on Commonwealth Edison Company stock from January 1 to March 6, 1940, was 30-7/8—32-5/8. Accordingly, it may be seen that the offering price was within one-quarter of a point of the highest quotation recorded in 1940 prior to the offering date.

A footnote in Schedule 12 relative to this sale indicates that the stock was offered by a syndicate headed by Dillon, Read & Co. which acquired the shares offered upon conversion of approximately $5,000,000 principal amount of Commonwealth Edison Company convertible debentures purchased from Continental Illinois National Bank and Trust Company of Chicago (each $100 of debentures being convertible into four common shares). The 200,000 shares

so offered to the public did not therefore constitute a new issue of securities in the sense that the offering was initiated by Commonwealth Edison Company as a sale of securities to the public. On the basis of 1939 earnings of $2.43 per share, the offering price of 32-3/8 resulted in an earnings-price ratio of 7.51 per cent. The proportion of the company's gross income available for common stock in 1939 was 61.69 per cent.

In April 1940, 714,835 common shares of Indianapolis Power & Light Company were offered to the public at a price of $24 per share. Of this number, 645,980 shares represented previously issued common stock which had been held by the Trustee of Utilities Power & Light Corporation, former parent company. The remaining 68,855 shares represented new financing by Indianapolis Power & Light Company, the proceeds from which constituted new capital. Based on 1939 earnings of $2.05 per share, the offering price of 27 resulted in an earnings-price ratio of 8.54 per cent. The proportion of the company's gross income available for common stock in 1939 was 33.95 per cent. In conjunction with its offering of common stock Indianapolis Power & Light Company also sold privately an issue of 2,500 shares of 6 per cent cumulative preferred stock as indicated in Schedule 11-A.

West Penn Power Company offered for sale to the public in April 1940 an issue of 160,000 shares of common stock representing new capital. The shares were sold at 27, which price, on the basis of 1939 earnings of $1.62 per share of common stock, resulted in an earnings-price ratio of 6.00 per cent. The proportion of the company's gross income available for common stock in 1939 was 52.85 per cent. In the same month the company offered publicly its first mortgage 3 per cent bonds, Series K, due 1970, Rating Aa, in the principal amount of $3,500,000 at a price of 104-1/4 to yield 2.78 per cent to purchasers, as indicated in Schedule 10-B.

Economic Conditions.

Chart 7—Chart 7 shows the range of the composite wholesale commodity price index of the U. S. Bureau of Labor Statistics over the period since 1920, as well as the whole-

sale price indexes for farm products, foods, and industrial products.

Chart 7 clearly portrays the severe decline in prices which started in 1929 and reached a record low point for the period in 1933. It will also be seen that from March 1933 to March 1937 prices rose steadily, with minor interruptions, the composite index rising from 60 per cent to 88 per cent of the 1926 level during this period. Subsequent to 1937, there was a gradual but steady decline in wholesale prices, with August 1939 indexes at the lowest levels since 1937.

However, in September 1939, coincident with the outbreak of war in Europe, all indexes advanced sharply. It is of interest to note that wholesale prices of farm products and foods advanced to a much greater extent than prices of industrial products, as indicated below:

	September 1939	August 1939	Net Increase
All Commodities	79.1	75.0	4.1
Farm Products	68.7	61.0	7.7
Foods	75.1	67.2	7.9
Industrial Products	82.1	80.1	2.0

Although the indexes for other commodities registered declines immediately following September 1939, the index for industrial products continued to rise for several months before the upward trend was checked.

From the end of 1939 through August 1940 the index for all commodities registered a net decline of 1.8 per cent, more than half of this decline having occurred since the end of May. The net decline in wholesale prices during the first eight months of 1940 was uniformly distributed among the three classes of commodities. However, fluctuations in prices among the individual commodity groups were wider than those reflected in the combined index.

The fluctuations in farm products prices were wider than in the case of foods and industrial products. From May through August, the farm products index declined from 67.9 to 65.6, or 2.3 per cent; the foods index from 71.4 to

70.1, or 1.3 per cent, and the industrial products index from 82.5 to 82.0, or 0.5 per cent.

Although the trend of wholesale commodity prices has been generally downward since September 1939, prices of the various commodity groups in August 1940 were still somewhat above the August 1939 levels, as disclosed in the following tabulation:

	August 1939	August 1940
All Commodities	75.0	77.4
Farm Products	61.0	65.6
Foods	67.2	70.1
Industrial Products	80.1	82.0

There have been some fluctuations in prices since August 1940, latest figures indicating that for the week ended October 5, the combined index was 77.8, with farm products at 65.5, foods at 70.7, and industrial products at 82.9.

(Vol. LXXIV, pp. 10813-10843.)

* * * * *

Chart 12—Chart 12 reflects the trend of corporate earnings, that is, net earnings available for preferred and common stock, based on earnings indexes computed by Standard Statistics Company for 13 utilities, 117 industrials and all Class 1 Railroads.

From this chart it may be seen that the trend of utility earnings has not been subject to very sharp fluctuations as in the case of industrials and railroads. While the earnings indexes for the latter two groups dropped within less than four years from peaks of 140 and 120, respectively, in the latter part of 1929, down to below-zero levels indicating substantial deficits in 1933, the reduction in public utility earnings in the same period is indicated by a decline in the earnings index from 140 to 90 (base year 1926 = 100).

In all three corporate groups there was a decline in earnings commencing in the latter part of 1937, but the decline in public utility earnings was much less pronounced. It will be noted that an upward trend in net earnings was maintained by all three groups throughout the year 1939, with the result that 1939 earnings exceeded those for 1938. Actually, utility and railroad earnings for 1939 almost

equalled the 1937 calendar-year levels, but industrial earnings still remained approximately 30 per cent below the 1937 level.

On the basis of estimated earnings for the nine months ended September 1940, as published by Standard Statistics Company, the average level of earnings for the twelve months ended September 1940 were considerably above the level for the calendar year 1939. The indexes for the year ended in September, as shown in Schedule 18, are as follows:

Public Utilities — 134.3; Industrials — 102.2; Railroads — 26.5. It will be noted that industrial earnings, at 102.2, were slightly below the 1937 level of 106.1, while utility and railroad earnings for the year ended September 1940 were at a somewhat higher level than in 1937.

It is of interest to note the average earnings indexes for the ten-year period 1930-1939 of the three groups of companies, which are as follows: Public Utility—110.5; Industrials—56.1; Railroads—10.0. In each instance the earnings index is compared with 1926 calendar-year earnings as equal to 100.

(Vol. LXXIV, pp. 10854-10855.)

* * * * *

Idle Money Factors:

The data in this section are presented for the purpose of showing the present situation with respect to the volume of idle investment funds and the factors contributing to the growth of such funds in recent years.

Schedule 26—This schedule reflects the total amount of funds carried by member banks of the Federal Reserve System in their reserve balances with the twelve Federal Reserve Banks, together with the portion thereof representing "required" reserves and "excess" reserves, as of the close of each year commencing with 1923.

Required reserves are funds which member banks are required by law to keep on deposit with the Federal Reserve Banks as reserves against deposits made with the member banks by their own customers. Member banks may carry balances with the Federal Reserve Banks in excess of their

required reserves, such excess balances constituting what are known as excess reserves.

Changes in reserve requirements since June 21, 1917 are shown on Page 2 of Schedule 26. Reserve requirements on demand deposits of member banks vary according to classes of banks. Member banks are classified into three groups: central reserve city banks, reserve city banks, and country banks. Central reserve city banks are member banks located in New York City and Chicago, reserve city banks are member banks in sixty other cities of lesser size, and country banks are member banks located elsewhere. It will be noted that reserve requirements on time deposits are uniform for all member banks, while there are important variations among classes of banks in required reserves based on demand deposits.

It will be noted that in the early years of the period the total reserve balances were not subject to marked fluctuation and excess reserve balances were comparatively small in relation to total reserves, some years in fact reflecting deficiencies in required reserves. This was the situation prevailing generally prior to 1931. In that year total reserves reached their lowest level following 1923 at 1,961 millions of dollars. In the following two years the reserves increased to 2,729 millions, but the increases in total reserves were reflected by increases in excess reserves which, at the end of 1933, were higher than those shown for any previous year.

From 1933 to 1935 total reserves more than doubled and excess reserves increased by approximately two billion dollars. Reserve balances continued to increase in 1936 but due to an increase in reserve requirements in August of that year excess reserves decreased 866 millions despite an increase of approximately a billion dollars in total reserves. The increases in reserve requirements in March and May 1937 effected a still further reduction of 772 millions in excess reserves, although total reserves increased about 400 millions in that year.

In April 1938 reserve requirements were reduced to approximately those established in March 1937 and thereafter, with no charges in reserve requirements, total reserves continued to increase to a level in excess of 13½ billion

dollars in 1940. Required reserves have increased from 5,815 to 7,058 millions since 1937, but excess reserves have increased by 5,400 millions to an unprecedented total of over 6½ billion dollars, the figure at September 25, 1940 being 6,645 millions.

Schedule 27.—The purpose of this schedule is to set out the factors which supply member bank reserve funds and those which use such funds in such manner as to show the various changes which have accounted for the rise in member bank reserve balances in the Federal Reserve Banks between June 1929 and September 1940.

The schedule shows that the factors supplying funds for the building up of member bank reserve balances are increases in outstanding Federal Reserve Bank credit, increases in the monetary gold stock, and increases in U. S. Treasury currency outstanding. Decreases in these items operate to decrease member bank reserve balances. Federal Reserve Bank credit consists of bills discounted for or advances made to member banks, bills bought in the open market, holdings of U. S. Government securities, and other items such as industrial advances made under Section 13b of the Federal Reserve Act.

On the other hand, the factors using or drawing upon member bank reserve balances are increases in currency in circulation, in U. S. Treasury cash holdings, in U. S. Treasury deposits with Federal Reserve Banks, in non-member bank deposits with Federal Reserve Banks and in other Federal Reserve accounts. Decreases in these items operate to increase member bank reserve balances. The item "other Federal Reserve accounts" consists of the sum of paid-in capital, surplus, other capital accounts, and all other liabilities (excluding deposits and Federal Reserve notes in circulation), less bank premises and all other assets (excluding gold certificates, cash, and so forth, on hand and holdings of bills discounted, U. S. Government securities, and so forth)

Inspection of Schedule 27 will show that the net effect of changes in these factors between June 1929 and September 1940 has been an increase of 11,347 million dollars in member bank reserve balances with the Federal Reserve Banks. With respect to such increase in member bank

reserve balances, it is shown that required reserves increased by 4,725 million dollars and excess reserves increased by 6,622 million dollars.

It is apparent from inspection of Schedule 27 that the most important factor contributing to the increase in member bank reserve balances has been the increase in the monetary gold stock. From approximately 4 billion dollars in June 1929 the gold stock had increased to 21 billion dollars in September 1940, a growth of over 17 billion dollars during the eleven-year period.

Analysis of the growth in the gold stock reveals that approximately 13 billion dollars of the increase has originated since 1934. Data available through September 1940, up to which time the increase in the gold stock since 1934 amounted to approximately 13 billion dollars, indicate that about half of this increase was accounted for by the net movement of capital to this country from foreign countries, not including over 4 billion dollars of gold imports arising from unaccounted-for transactions. The remainder of the increase was accounted for principally by favorable balances of trade and services with foreign countries and domestic gold production, which were offset to some extent by net imports of silver.

Schedule 28.—This schedule shows comparative figures for all years since 1923 on total deposits and total loans and investments of all banks in the United States as contained in annual and monthly publications of the Board of Governors of the Federal Reserve System. Data are shown separately for non-member banks and member banks of the Federal Reserve System.

The data on deposits reflect an increase of approximately seven billion dollars in total deposits, exclusive of interbank deposits, from June 1929 to June 1940, whereas the comparable figures on loans and investments indicate a decrease during the same interval of about seven billion dollars. The comparison reflects a net increase in uninvested funds during the eleven-year period of around fourteen billion dollars for all banks in the United States.

For member banks of the Federal Reserve System the increase in deposits during the eleven-year period was about ten billion dollars and the decrease in loans and

investments amounted to approximately one billion dollars, indicating a net increase of around eleven billion dollars in uninvested funds of member banks during the period. This amount is seen to correspond closely with the increase in member bank reserve balances between June 1929 and September 1940 shown in Schedule 27. (A comparison with June 1940 member bank reserve balances would give substantially the same result inasmuch as the June reserve balances did not exceed the September balances by more than twenty million dollars.)

Because of reserve requirements imposed upon member banks by law, it is evident from Schedule 27 that they are restricted in the use of reserve balances for expansion of loans and investments to that portion thereof representing excess or idle reserves. These excess reserves, as above stated, amounted to 6,645 million dollars at September 25, 1940. By reference to Page 2 of Schedule 26, however, it is apparent that loans and investments could be expanded several times the amount of current excess reserves before the latter would be absorbed into required reserves under operation of current reserve requirements. This possibility arises from the fact that expansion in loans and investments by the member banks considered as a whole would give rise to increased deposits, unless there are offsetting influences, whereas the banks would be required to maintain reserves against such increased deposits only to the extent of the required percentages shown in Schedule 26.

From the data presented in this section, it may be seen that opportunities for investment, because of the growth in the volume of idle funds, have been more limited in the past few years than formerly, particularly in view of the fact that since the beginning of 1934, as reflected in Schedule 9, more than two-thirds of all corporate financing in the United States has been for refunding purposes. This situation with respect to idle funds has been reflected in the declining level of interest rates during the period since 1934.

(Vol. LXXIV, pp. 10866-10872.)

* * * * *

Rate of Return Study—Part II.

As previously stated, Part II of the rate of return study contains some general statistics of the natural gas industry

and presents certain facts with respect to the ownership, issuance, prices and yields of securities of natural gas pipe-line companies. The statistical data are contained in Schedule 1 to 4, inclusive, and Charts 1 to 3, inclusive, as listed in the Table of Contents. The data pertaining to securities of natural gas pipe-line companies are contained in Schedule 5, together with its underlying Schedules 5-A, 5-B, 5-C, 5-D, 5-E, 5-F, and 5-G, and in Schedule 6. Chart 4 and Schedule 7 contains information respecting the corporate affiliations of the companies involved in the present proceedings, and recent financing by companies affiliated therewith.

Operating and Financial Statistics of the Natural Gas Industry: Schedule 1.

Revenues from Sales to Customers. Schedule 1 portrays the growth of the distributing end of the natural gas industry. It shows revenues, volume of gas sales, and number of customers by years from 1929 to 1939, both inclusive, as taken from Statistical Bulletin No. 41, October, 1940, published by the American Gas Association under the title "Annual Statistics of the Natural Gas Industry in 1939." The data on revenues, gas sales and customers are set forth under separate captions in the upper, middle, and lower portions of the schedule.

As indicated in the footnote, the figures do not include natural gas used in field operations and in the manufacture of carbon black or gas used by distributing companies in the conduct of their own operations. Furthermore, the statistics do not include data for companies selling mixed manufactured and natural gas.

By referring to the upper section of the schedule, it will be seen that during the eleven-year period revenues increased from 376 million to 448 million dollars, or by approximately 19 per cent. With the general falling off of business in 1938, revenues declined some 28 million dollars below the 1937 level but in 1939 they increased approximately 33 million dollars and exceeded 1937 revenues by over 5 million dollars. Following 1929, revenues increased somewhat in 1930; fell off in 1931, 1932 and 1933 and recovered in 1934, each year thereafter except 1938 reflecting a substantial increase over the previous year. According to the latest

report of the American Gas Association, revenues for the first seven months of 1940 have reflected a substantial increase over the revenues for the same period in 1939.

The classification of revenues shown in Schedule 1 reveals that revenues derived from sales to domestic consumers, including natural gas sold for house heating purposes, constitute substantially more than half of the total revenues reported. In 1929 such revenues amounted to $223,000,000 and, while falling off to the extent of 5 percent at the low point of the depression, recovered rapidly and were $32,000,000 higher in 1939 than in 1929.

Commercial revenues showed steady improvement each year during the eleven-year period, except in 1933 and 1938, increasing from $32,000,000 in 1929 to over $50,000,000 in 1939, a gain of over fifty per cent.

Revenues from industrial sales, including natural gas used as fuel by electric utilities, amounted to $120,000,000 in 1929. During the depression years, revenues from this source declined to $75,000,000 in 1932, but recovered in 1933 and by 1937 were $26,000,000 higher than in 1929. In 1938 revenues from industrial and electric utility consumers amounted to $126,000,000 off $20,000,000 from 1937, but in 1939 recovered again to $142,000,000 which amount, however, was still $5,000,000 below the 1937 total. According to the latest report of the American Gas Association, the revenues for industrial and electric generation consumers for the first seven months of 1940 exceeded the revenues for the same period in 1939 by over $6,000,000.

Average Annual Revenue per M.C.F. of Gas Sales. The average annual revenue per M.C.F. of gas sold amounted to 38 cents in 1929, was 41.1 cents in 1932, 33.7 cents in 1937, 34.3 cents in 1938, and 33.8 cents in 1939, a net decrease of 4.2 cents since 1929.

The average revenue from domestic sales was 66.7 cents in 1929 and, after reaching 71.1 cents in 1932 and 1933, gradually declined to 68.6 cents in 1939, a net increase of 1.9 cents per M.C.F. since 1929.

The average revenue per M.C.F. of gas sold to commercial consumers has been following a steadily downward trend since 1929 and declined from 56.5 cents in 1929 to 46.1 cents in 1939, a net decrease of 9.4 cents per M.C.F. since 1929.

The average for industrial and electric utility sales has declined from 20.1 cents per M.C.F. in 1929 to 16.9 cents in 1939, a decrease of 3.2 cents, the 1939 average being almost one cent higher than the average of 16.0 cents for 1934.

Gas Sales to Consumers (M.C.F.). Total gas sales reported for 1929 aggregated 991 million M.C.F. In 1932, sales reached a low point of 834 million M.C.F. for the eleven-year period. Subsequent years through 1937 witnessed steady improvement and the 1937 total was 1314 million M.C.F., a decline of about 104 million M.C.F. taking place in 1938, but during 1939 the total again reached a new level of 1,328 million M.C.F. The bulk of the large increase of 337 million M.C.F. in volume of sales between 1929 and 1939 was brought about by increased sales to industrial and commercial consumers. Commercial consumption increased from 58 to 109 million M.C.F. during the period and industrial consumption increased from 597 to 846 million M.C.F., while domestic consumption increased from 335 million M.C.F. in 1929 to 373 million M.C.F. in 1939. About 85 percent of the increase in total gas sales in 1939 over 1938 was attributable to the increase in industrial consumption. Fluctuations in industrial consumption normally would tend to conform to changes in economic conditions. However, upon comparison with the fluctuations reflected in the Federal Reserve Board's index of industrial production, it was found that, using an index with 1929 as the base year in each case, industrial consumption did not fall during the depression years to the lowest level reached by the index of gas sales to industrial and electric utility consumers has been at a substantially higher level than the index of industrial production. This situation would appear to be accounted for in large part by the expansion in number of industrial customers since 1929, such expansion being indicated by the increase from 22,000 customers in 1929 to 43,000 in 1939.

Average Annual Gas Sales (M.C.F.) per Customer. Average annual sales in M.C.F. per customer are based on the number of customers at the end of each year.

Sales to domestic consumers declined during the period as a *whole*, the average M.C.F. per customer per year being 60.5 in 1929 and 54.3 in 1939. However, the low point was 51.3 in 1934 and there was slight increases in 1935, 1936 and

1937, as well as in 1939, although in the latter year the average was still slightly below the 1937 figure.

The average consumption per commercial customer was 175.6 M.C.F. per year in 1929, reaching a low point of 164.2 in 1931, increased to 179.5 in 1932, fell off to 170.4 in 1933 and increased thereafter in each year to 204.1 in 1937.

Average industrial sales in M.C.F. per customer per year, fluctuated more sharply as would be expected in a period of changing economic conditions such as business has experienced since 1929. The sales per customer were 27,135 M.C.F. in 1929, dropped to 17,440 in 1933 and recovered thereafter, reaching 21,294 in 1937. In 1938 the average consumption per customer declined to 18,044 M.C.F., but in 1939 increased to 19,673 M.C.F.

Number of Customers at End of Year. The data on number of customers at end of year shown in the lower portion of Schedule 1 reveals a substantial growth since 1929, the number of all customers increasing from 5,896,000 in that year to 7,454,000 in 1939, an increase of 1,558,000 customers. In only one year 1932, is a decline in total number of customers shown although it will be noted that the number of customers did not vary between 1930 and 1931.

Domestic customers increased from 5,540,000 in 1929 to 4,870,000 in 1939, a gain of 24 per cent in the eleven-year period. Except in 1931 and 1932 there was a substantial increase in domestic customers each year. The number of commercial customers reflected a marked growth during the period since 1929, the increase in this group being from 334,000 in 1929 to 541,000 in 1939, a gain of over 60 per cent. The number of industrial customers has almost doubled, increasing from 22,000 in 1929 to 43,000 in 1939.

Average Annual Revenue per Customer. The average revenue per domestic customer was $40.34 in 1929 and $37.24 in 1939. For commercial customers the average was $97.54 in 1929 and $93.09 in 1939. It will be noted that in 1939 average annual revenue for both domestic and commercial customers increased over that for 138 but was somewhat lower than in 1937. Average revenues per industrial customer fluctuated considerably during the eleven-year period, and, while the number of customers almost doubled, the

annual revenue per industrial customer dropped from $5,463.95 in 1929 to $3,318.42 in 1939.

Schedule 2—Schedule 2 contains comparative estimated income statements for the years 1931 to 1939, inclusive, of the companies for which revenues, gas sales and customer data were presented in Schedule 1, and was taken from the same statistical bulletin of the American Gas Association.

It will be noted that the revenues from gas sales to consumers shown on the first line in Schedule 2 are in agreement with the revenue data shown in the upper portion of Schedule 1. Examination of Schedule 2 discloses that net operating income, designated as "Utility Operating Income" was $107,681,000 in 1939, or about $10,000,000 higher than that for 1938 although $4,000,000 lower than the 1937 figure of $111,811,000 which represented the peak for the nine-year period, and $2,000,000 lower than the 1936 total. The low point following 1931, for which year net operating income was reported at $84,601,000 was reached in 1933 at $65,188,000. In 1934 net operating income recovered to $71,382,000 and increased to $93,508,000 in 1935.

Net income available for dividends and surplus followed the same general trend, starting at $51,103,000 in 1931, declining to $26,940,000 in 1933, rising steadily to $74,989,000 in 1937, declining to $62,275,000 in 1938, and increasing to $72,152,000 in 1939. It will be noted that although net operating income in 1939 was lower than in 1936, net income available for dividends and surplus was higher in 1939 by $3,000,000, chiefly because of a decrease in interest and other deductions of almost $6,000,000.

Utility plant, which is reported only for the years 1934 to 1939, inclusive, increased from 1934 to 1938 by approximately $111,000,000. In 1939 utility plant was reported at $2,414,490,000, which was about $30,000,000, less than the amount reported for 1938.

Chart 1.—This chart shows at the right monthly sales of natural gas and revenues there from by months during the years 1929 1937, 1938, 1939 and the first half of 1940. At the lower left, are shown monthly revenues of the manufactured gas industry and at the upper left combined revenues of the total gas industry during the same years, except for 1939 which in general coincided with 1938.

The revenues for the entire gas industry were generally higher in 1937 than in 1929 and 1938, but showed a substantial increase over 1937 during the first half of 1940, due generally to the increase in sales of natural gas. Revenues from the sale of manufactured gas show generally a decline since 1929. On the chart at the right, the lower group of curves shows that the revenues of the natural gas industry have increased generally since 1929 and are at a new high level in 1940.

The upper group of curves on the chart at the right shows that the business of natural gas companies is highly seasonal in character, as indicated by monthly fluctuations in the volume of gas sold. Volume of sales in recent years has been substantially greater than in 1929. In 1939 sales were greater in the first and last few months but smaller in the summer months than was the case in 1937, total sales for 1939, however, exceeding those of 1937 by about 13,000,000 M.C.F. Deliveries during most of the first six months of 1940 were greater in volume than in 1939, with sales in February at the greatest volume recorded for that month.

Chart 2—Chart 2 is presented in order to show the monthly trend of sales in 1940 as compared with 1939 both in total and by classes of revenue, that is, domestic, commercial and industrial. The chart shows that total monthly revenues in 1940 through the month of June were substantially higher than in 1939, with the largest consistent gain being in domestic revenues, although industrial and commercial revenues, particularly in the first few months of 1940, also reflected a substantial increase over 1939. The February peak in revenues will be seen to have been accounted for by peaks in domestic and commercial revenues recorded in that month.

Chart 3—Chart 3 is a photostatic copy of a chart taken from the American Gas Association's Statistical Bulletin No. 41 of October 1940. The chart compares the American Gas Association's index of total natural gas consumption by domestic and commercial consumers, with its index of manufactured gas consumption by all classes of consumers, and with the Standard Statistics index of industrial ac-

tivity, all indexes being based on the year 1926 as equal to 100.

The reason for omitting industrial sales in constructing the index of natural gas sales while including them in the index of manufactured gas sales is easily found by comparison of the relationship of industrial sales to total sales. In the case of manufactured gas, industrial sales for the twelve months ended December 1939, as reported in the American Gas Association's Monthly Summary of Gas Company Statistics for that month, amounted to approximately 58.5 million Mcf., or roughly 16 per cent of total manufactured gas sales. However, sales of natural gas for industrial use in the same period, including sales for electric generation purposes, amounted to approximately 846 million Mcf., or 64 per cent of total natural gas sales.

The chart shows that manufactured gas sales rose to 116 per cent of the 1926 level in 1930, fell to somewhat less than the 1926 level in 1933, increased steadily thereafter through 1939, the index reaching about 120 in that year. Sales of natural gas, however, on the basis indicated, have increased to a substantially greater extent since 1926 than manufactured gas sales.

The index of natural gas sales rose to 130 by 1929, dropped to 118 in 1933, which was still far above the 1926 level, advanced to about 146 by 1937 and fell off to a moderate extent in 1938, but reached a new peak in 1939. Thus in 1939 the volume of natural gas sales was approximately 54 per cent greater than in 1926, while manufactured gas sales were only about 20 per cent greater.

It will be seen by comparison with the Standard Statistics index of industrial activity that although both the natural and manufactured gas industries experienced a decline in volume of gas sold during the depression years, the volume did not decline below the 1926 level, except to a slight extent in the case of manufactured gas, in contrast with the experience of industry in general, for which a decline in activity of about 45 per cent from the 1926 level was recorded at the lowest depth of the depression.

Schedule 3—Schedule 3 shows the total amount of natural gas production and consumption in the United States for

the years 1926 to 1939, inclusive, and the amount transported in interstate commerce for the years 1926 to 1938, inclusive. From 1926 to 1939, natural gas production increased from 1,313 million to 2,435 million Mcf. Consumption, excluding gas used for field operations and manufacture of carbon black, increased from 704 million to 1,436 million Mcf. in the same period.

Natural gas transported in interstate commerce increased from 209 million Mcf. in 1929 to 636 million Mcf. in 1938. In other words, since 1926 production has increased 85 per cent, and consumption other than for field use and carbon black manufacture has more than doubled. These increases were accompanied by an increase of over 209 per cent in the quantity of natural gas transported in interstate commerce up to 1938 and, as will be seen from column (e) of the schedule, the proportion of the total quantity of natural gas consumed which is transported in interstate commerce has also been steadily increasing. Thus in 1938 this proportion was about 48 per cent of total consumption, whereas in 1926 the proportion was approximately 30 per cent, indicating the increased importance of natural gas as a commodity in interstate commerce.

Schedule 4—Schedule 4 is presented for the purpose of showing data on the interstate movement of natural gas into the states of Colorado and Wyoming, as taken from publications of the U. S. Bureau of Mines. The schedule shows that since 1929 Texas has been the largest source of natural gas transported into Colorado from other states.

The quantity of gas transported from Texas into Colorado is shown in Schedule 4 to have increased from 12,563,000 Mcf. in 1929, the first full year of operation of the Denver line, to 20,511,000 Mcf. in 1937, and to have declined to 18,210,000 Mcf. in 1938. The records of the Federal Power Commission indicate that all gas moving into Colorado from Texas is transported through the pipe lines of the Canadian River Gas Company and Colorado Interstate Gas Company, two of the three companies involved in the present proceedings.

With respect to natural gas transported into the state of Wyoming from other states, Schedule 4 shows that since

1931, the largest portion thereof has consisted of gas transported from Texas. In 1929 and 1930, the only interstate movement of gas into Wyoming was reported as gas transported from Colorado. The Commission's records disclose that the only movement of natural gas into Wyoming from Texas is transported through the facilities of the two above-named companies and those of the Colorado-Wyoming Gas Company, the third company involved in the present proceeding. The latter company formerly transported gas into Wyoming from the Wellington, Colorado, fields, but when that field began to show signs of depletion, the company's pipe line system was extended south and connected with the system of Colorado Interstate Gas Company in 1931.

Ownership, Issuance, Prices and Yields of Securities of Natural Gas Pipe Line Companies.

Schedule 5—Schedule 5 contains summarized data with respect to the security issues of 25 natural gas pipe line companies.

In preparing this list an attempt was made to include all natural gas companies which had the following characteristics:

(1) Companies engaged in the production and transmission of natural gas and sales thereof at wholesale and to main line industrial customers.

(2) Companies engaged in the transmission of natural gas and sales thereof at wholesale and to main line industrial customers.

(3) Companies so engaged which had operating revenues of $2,500,000 or more.

The purpose in selecting companies conducting operations of the type mentioned with revenues of $2,500,000 or more was to obtain a group of companies exhibiting generally the characteristics shown by the companies involved in the present proceedings.

Schedule 5 sets forth for each of the 25 companies having the characteristics just mentioned the total amount of securities outstanding and a breakdown of the total for each company according to classes of securities, i. e., bonds, de-

bentures, notes, preferred stock, and common stock. Also shown for each company and each class of security, based on the most recent information available, are the amounts of securities held by the public, by institutions, and by affiliates. Institutional holdings include securities held by banks, insurance companies, universities, and so forth.

In this connection, it should be pointed out that Schedules 5-A to 5-G, inclusive, contain details supplementing or supporting the data contained in Schedule 5. For example, Schedule 5-A contains certain information with respect to the bonds, debentures, and notes of the companies listed in Schedule 5 which are held by the public. Schedule 5-B gives details regarding the identity of institutional holders of bonds, debentures, and notes of the companies and the amounts of individual holdings. Schedule 5-C lists the holdings of bonds, debentures and notes by affiliates. Schedule 5-D shows certain information with respect to preferred stock of the companies held by the public, and Schedule 5-E sets forth the holdings of preferred stock by affiliated interests. Schedule 5-F contains data on market prices, earnings per share, dividends, and so forth, on common stock of the companies held by the public. Lastly, common stock holdings by affiliates of the companies are listed in Schedule 5-G.

The summary at Page 5 of Schedule 5 discloses that the 25 natural gas pipe line companies listed therein had securities outstanding as of the latest date for which information is available in the aggregate amount of $657,399,135. These outstanding securities consisted of bonds, debentures and notes in the amount of $328,447,620, or 50.0 per cent of the total; preferred stocks in the amount of $25,131,000 or 3.8 per cent and common stocks in the amount of $303,820,515, or 46.2 per cent. The respective amounts of bonds, debentures and notes outstanding, together with the relationship of each to the total amount of all securities outstanding, were as follows:

	Amount	Per Cent of All Securities Outstanding
First mortgage bonds	$188,083,523	28.6
Debentures	39,350,000	6.0
Notes	101,014,097	15.4
Total	$328,447,620	50.0

Of the total amount of bonds, debentures and notes outstanding, affiliated interests held $182,408,097, or 55.5 per cent, institutional holdings totalled $126,628,000, or 38.6 per cent, and holdings by the general public amounted to $19,411,523, or 5.9 per cent. Of the total of $25,131,900 of preferred stocks outstanding, holdings by affiliated interests amounted to $23,639,200, or 94.1 per cent, and the remainder, or 5.9 per cent, was held by the public. Of the common stock outstanding, amounting to $303,820,515, the public held $10,394,418, or only 3.4 per cent, and affiliated interests owned the remainder.

Applying similar calculations to the total of all outstanding securities of the 25 companies listed in Schedule 5, it is found that the proportion held by the general public was 4.7 per cent and that held by institutional investors was 19.3 per cent, while the proportion held by affiliated interests constitutes 76.0 per cent of the total.

The foregoing calculations clearly indicate the predominant position held by affiliated interests with respect to the ownership of outstanding securities of natural gas pipe line companies. To summarize, affiliated interests owned 55.5 per cent of the bonds, debentures and notes, 94.1 per cent of the preferred stocks, and 96.6 per cent of the common stocks of the 25 companies listed in Schedule 5. On the other hand, only 5.9 per cent of bonds, debentures and notes, 5.9 per cent of preferred stocks, and 3.4 per cent of common stocks of the 25 companies were held by the general public.

With respect to each of the companies listed in Schedule 5, except Canadian River Gas Company and Colorado In-

terstate Gas Company for which it is believed an adequate description will appear in the record of the present proceedings, a brief statement is presented in the following paragraphs describing the nature and location of operations, source of supply, and other pertinent data. Although some of the information presented below is given as of the end of 1938, it is believed that it will suffice as a general description of the companies' operations.

The Arkansas-Louisiana Gas Company is engaged in the production, transmission and distribution of natural gas. Its sources of supply are the Monroe, Richland and Elm Grove fields in Louisiana and certain other fields in Texas and Arkansas. The company supplies natural gas to a large number of communities in Arkansas, Louisiana, and Texas. The principal communities served at retail are Little Rock, Arkansas; Shreveport, Louisiana; and Texarkana, Texas. Gas is sold at wholesale, among others, to Consumers Gas Company for distribution in the city of Hot Springs, Arkansas, and to other companies for distribution in two smaller communities in Arkansas.

The company has 1,371 miles of transmission lines and has 10 compressor stations with an aggregate rated capacity of 26,390 h.p. The First Mortgage, 2¾ per cent, 1940-1944 bonds in the amount of $3,300,000 were held, it is indicated on Page 1 of Schedule 5, by institutions.

Referring to Page 1 of Schedule 5-B, it will be seen that the $3,300,000 First Mortgage bonds above mentioned are held by the Guaranty Trust Company of New York and by the Central Hanover Bank & Trust Company, the former owning $2,800,000 of the bonds and the latter, $500,000 thereof. The first mortgage, 3½ per cent, 1945-1954 bonds in the amount of $9,700,000 were also owned by institutions, as is indicated in Schedule 5, and Schedule 5-B shows that the entire issue was owned by the following institutions in the amounts indicated:

Equitable Life Assurance Society of U. S.	$4,850,000
Metropolitan Life Insurance Company	3,550,000
Massachusetts Mutual Life Insurance Company	400,000
Sun Life Assurance Co. of Canada	350,000
Teachers Ins. & Annuity Association of America	300,000
Provident Mutual Insurance Co. of Philadelphia	250,000
	$9,700,000

The $6,500,000 of Debentures shown in Schedule 5 were all held by the Arkansas Natural Gas Corporation as is shown on Page 1 of Schedule 5-C. Common stock of the company outstanding consisted of 298,988 shares of an aggregate par value of $14,949,400. All of the common stock was held by affiliates and Schedule 5-G indicates that the entire issue in question was owned by the Arkansas Natural Gas Corporation, a subsidiary of the Cities Service system.

Chicago District Pipeline Company. This company is engaged in the purchase, transmission and sale of natural gas. Its gas transmission system consists of approximately 43 miles of 24-inch pipe line from Joliet, Illinois, to a point of connection with a transmission main of the Peoples Gas Light & Coke Company or the southern limits of the city of Chicago; approximately 1.3 miles of 20-inch pipe line from the company's 24-inch system to a point on the Illinois-Indiana State line; approximately 31 miles of 24-inch pipe line and 4 miles of 20-inch pipe line forming a connection with a transmission main of the Peoples Gas Light & Coke Company on the western limits of the city of Chicago. The Chicago District Pipeline Company purchases its gas requirements from the Natural Gas Pipeline Company of America. The largest sales by the Chicago District Pipeline Company are to the Peoples Gas Light and Coke Company. The notes payable of the company in the amount of $2,769,897 were owned by the Natural Gas Investment Company, as shown in Schedule 5-C. The common stock, consisting of 7,500 shares of no par value, with book amount of $659,000, was all held by the Natural Gas Investment Company, as indicated in Schedule 5-G.

7

Cities Service Gas Company. This company is engaged in the production and transmission of natural gas. It obtains its gas from a number of fields in Texas, Oklahoma, and Kansas, including particularly, the Panhandle field in Texas and the Oklahoma City and Seminole fields in Oklahoma. The company's system consists of 4,273 miles of pipe lines and 29 compressor stations. Gas is sold at wholesale to distributing companies serving 229 communities, including Kansas City, St. Joseph, Springfield, and Independence, Missouri; Bartlesville, Oklahoma; and Kansas City, Leavenworth, Topeka, and Wichita, Kansas.

The company has outstanding First Mortgage 3¼ per cent and 3¾ per cent bonds due 1940-1954 in the amount of $35,000,000, all of which bonds are held by institutions. The 3¾ per cent bonds, aggregating $20,000,000, were owned outright by two insurance companies, as indicated on Page 1 of Schedule 5-B, and the remaining $15,000,000, 3¼ per cent bonds were held as collateral for loans, as noted on Page 1 of Schedule 5.

The $8,000,000 Debentures, 5½ per cent, 1956, were held by the Cities Service Company and subsidiaries, as shown in Schedule 5-C. The common stock of the company consisting of 350,000 shares of no par value was all held by the Empire Gas & Fuel Company, a Cities Service subsidiary, as shown in Schedule 5-G.

The El Paso Natural Gas Company is an operating and holding company. It purchases gas from producers in southeastern New Mexico. The company and its subsidiaries are engaged in the business of purchasing natural gas from producers in New Mexico, transmitting it through a pipe line system and selling it at wholesale to public utility and industrial customers located principally in or near El Paso, Texas; Hurley, New Mexico; Phoenix, Arizona; and Cananea, Mexico. The pipe lines of the company and its subsidiaries consist of 1,331 miles including duplicate lines, branch lines, and gathering lines. The First Mortgage, 3¼ per cent bonds of the company in the amount of $6,000,000 and its First Mortgage, 3 per cent bonds in the amount of $3,000,000, were held by the following institutions, as is shown on Page 2 of Schedule 5-B:

Sun Life Assurance Co. of Canada	$900,000
Equitable Life Assurance Society of U. S.	2,500,000
Massachusetts Mutual Life Insurance Company	275,000
Metropolitan Life Insurance Company	2,000,000
Mutual Life Insurance Co. of New York	475,000
Harvard College	100,000
Total, First Mortgage, 3½% bonds	$ 6,300,000

All of the preferred stock of the company, consisting of 7 per cent cumulative preferred stock of a par value of $100 per share, was owned by the public, and the common stock of the company was likewise held by the public.

The Hope Natural Gas Company is engaged in the production, purchase, transmission and distribution of natural gas. It is one of the oldest and most important gas subsidiaries of the Standard Oil Company (New Jersey) in the Appalachian field. The company's operations are confined to the State of West Virginia, but its main outlets are sales to the East Ohio Gas Company which operates in the State of Ohio, and to the Peoples Natural Gas Company which operates in the state of Pennsylvania, both of which companies are likewise subsidiaries of the Standard Oil Company (New Jersey). The only security outstanding of the Hope Natural Gas Company was common stock, all of which was owned by the Standard Oil Company (New Jersey).

The Houston Gulf Gas Company is engaged in the production, purchase, transmission and wholesale distribution of natural gas. The principal producing properties of the company are located in South Texas. The main pipe lines extend from the field in South Texas to Houston, Texas, and industrial areas in that vicinity. Pipe lines of the company aggregate 482 miles.

The company sells at wholesale substantially all requirements of about 18 communities in southern Texas. The company is also engaged in the production, transportation and sale of a limited amount of crude oil. The bonds and debentures of the company, as shown in Schedule 5, were

*The First Mortgage, 3 per cent bonds were held by these five insurance companies, the amounts held by each not being reported.

largely held by the public. The company's outstanding notes were held by an affiliate, United Gas Pipeline Company, as shown in Schedule 5-C. The preferred stocks were largely held by an affiliate, United Gas Pipeline Company, as indicated in Schedule 5-E. Most of the common stock of the company was also held by the United Gas Pipeline Company, a subsidiary of United Gas Corporation, as shown in Schedule 5-G.

The next company is Interstate Natural Gas Company, Inc., whose securities outstanding consisted of common stock, some of which was held by the public but the major portion of which, however, was held by Standard Oil Company (New Jersey) and the Columbian Carbon Company, as indicated in Schedule 5-G. The Interstate Natural Gas Company, Inc., owns 170 miles of main pipe line, 22 inches in diameter, running from the Monroe Gas Field in northern Louisiana to Baton Rouge, Louisiana. It serves at wholesale companies supplying natural gas to Natchez and Baton Rouge, and it connects at Baton Rouge with a pipe line of the United Gas Pipeline Company, which supplies gas for resale in the city of New Orleans.

The Lone Star Gas Company is engaged in the production, transmission and distribution of natural gas and also, to some extent, in the production of crude oil. Its transmission lines are in two service groups. A main group extends from the southeastern extremity of the Texas Panhandle to Fort Worth and Dallas, where it connects with transmission and distribution lines which extend through the central part of Texas and southern Oklahoma.

The company distributes gas directly in Fort Worth. The secondary group extends in a southwesterly direction from Brownwood, Texas, to San Angelo, Texas. The company owns 4,384 miles of mains and field lines and 21 compressor stations. The company had outstanding notes in the amount of $16,000,000 which were held by the Lone Star Gas Corporation, parent company, as shown in Schedule 5-C. All of the company's outstanding common stock was held by same holding company, as indicated in Schedule 5-G.

The Kentucky-West Virginia Gas Company is engaged in the production, transmission and sale of natural gas. The

company owns and operates natural gas properties and 518 miles of pipe line in the states of Kentucky and West Virginia.

Practically the entire output is furnished to the Louisville Gas & Electric Company and the Philadelphia Company and subsidiaries. As shown in Schedule 5-E all of the 5 per cent cumulative first preferred stock of this company was held by Louisville Gas & Electric Company, and all of the 7 per cent cumulative second preferred was held by the Philadelphia Company and subsidiaries. The company's common stock was owned by the Louisville Gas & Electric Company (40 per cent) and the Philadelphia Company (60 per cent), as indicated in Schedule 5-G.

The Memphis Natural Gas Company is engaged in the purchase and transmission of natural gas. The company's main pipe line extends from the Monroe field in Louisiana to Memphis, Tennessee, a distance of 402 miles. All of the notes of the company were held by institutions and somewhat more than half of the common stock of the company was held by the public while the remainder was held by Commonwealth Gas Corporation.

The Mississippi River Fuel Corporation is engaged in the transmission of natural gas. The company owns and operates 450 miles of main pipe line from Louisiana to St. Louis, Missouri, together with main compressor stations and branch pipe lines incident to the delivery of natural gas to industrial consumers and to distributors to communities along the route. All of the first mortgage bonds of the company were held by institutions. The 6 per cent notes payable and all the common stock were held by affiliates.

The Michigan Gas Transmission Corporation is engaged in the purchase and transmission of natural gas. The company owns a transmission line which commences at the Illinois-Indiana State line near Dana, Indiana, connecting at that point with the main line of the Panhandle Eastern Pipe Line Company, and extends to Muncie, Indiana, where it connects with the line of the Ohio Fuel Gas Company.

The company also owns a pipe line extending to Detroit, Michigan, from Zionville, Indiana, through which it transports natural gas to Detroit for the account of Panhandle

Eastern Pipe Line Company. Natural gas is purchased from Panhandle Eastern Pipe Line Company and sold by the company at wholesale only.

All of the company's outstanding securities, consisting of notes payable amounting to $6,470,500 and $2,240,000 of common stock, were held by Columbia Gas & Electric Corporation.

The Natural Gas Pipeline Company of America is engaged in the purchase and transmission of natural gas. Gas from the Texas Panhandle field is purchased by the company from Texoma Natural Gas Company and Colorado Interstate Gas Company at a point of delivery near Gray, Oklahoma. The company transports the gas through its own transmission system extending through the states of Oklahoma, Kansas, Nebraska, Iowa, and Illinois to Joliet, Illinois, where the gas is delivered to Chicago District Pipeline Company which sells the gas to utilities for distribution in the Chicago area. Comparatively small amounts of gas are sold by the company at different points along its main transmission line, the largest proportion of such gas being sold for resale to communities in Iowa.

The company's securities, consisting of First Mortgage 6 per cent bonds due 1946 in the amount of $42,300,000 and $3,000,000 book amount of common stock, were all held by affiliated interests.

The New York State Natural Gas Corporation is engaged in the production and transmission of natural gas in northwestern Pennsylvania and southwestern New York where gas is produced and transported for sale to distribution systems of others in several cities and towns in central New York, of which Syracuse, Auburn, Cortland and Ithaca are the most important. The system, including pipe lines of an affiliate, Keuka Construction Corporation, consists of approximately 256 miles of pipe lines, owned or leased gas rights on approximately 325,500 acres of land and 36 wells.

The company's securities, consisting of income notes and common stock, were all owned by Lycoming United Gas Corporation, a subsidiary of Standard Oil Company (New Jersey).

The Northern Natural Gas Company is engaged in the

production, purchase, transmission and distribution of natural gas. The company and subsidiaries own and operate approximately 2,200 miles of natural gas transmission lines, extending from the Texas Panhandle and Hugoton, Kansas, fields to South Dakota and Minnesota. The main transmission lines are largely 24 inches in diameter. Natural gas is sold principally at wholesale in Iowa, Kansas, Nebraska, South Dakota, and Minnesota. Cities supplied at wholesale include Omaha and Lincoln, Nebraska; Council Bluffs, Des Moines, Sioux City, Mason City and Fort Dodge, Iowa; Sioux Falls, *South* Dakota; and Minneapolis and Rochester, Minnesota. The company's First Mortgage, 3½ percent, 1954 bonds and the 2⅛ percent notes due 1940-1946 were all held by institutions. The bonds were sold to the institutions in August of last year. The common stock of the company was all held by three affiliates.

The Panhandle Eastern Pipe Line Company is engaged in the production, purchase, transmission and distribution of natural gas. The company owns a natural gas transmission system extending from the Amarillo gas field in the Texas Panhandle through Oklahoma, Kansas, Missouri and Illinois to a point near Dana, Indiana, adjacent to the Illinois-Indiana State line. The major portion of the gas transmitted is sold at wholesale to other gas transmission and distributing companies and the balance is sold to industrial consumers. The principal distributing company served is the Michigan Consolidated Gas Company which supplies gas to customers in Detroit, Michigan, and vicinity. The company's transmission system consists of approximately 2,100 miles of pipe line. The First Mortgage, 4 percent, 1952 bonds of the company were owned in part by the public, but largely by institutions. The bonds were issued in March 1937. The preferred stock, both Series A and Series B, was all held by the Columbia Oil & Gasoline Corporation, and the common stock was held by the Columbia Oil & Gasoline Corporation and by the Missouri Kansas Pipe Line Company.

The Pittsburgh & West Virginia Gas Company is engaged in the production, purchase, transmission, distribution and sale of natural gas. The company operates 1,375 miles of pipe line and serves gas to 44 communities in the State of West Virginia, and sells gas at wholesale to a number of

companies. The outstanding notes of the company, amounting to $13,090,446, were held by affiliated companies. All of the common stock of this company was held by Philadelphia Company, a Standard Gas & Electric subsidiary."

The Southern Natural Gas Company is engaged in the transmission of natural gas. The company purchases gas under long term contract from the Monroe and Richland fields in Louisiana and transports gas from these fields to markets in Mississippi, Alabama and Georgia. The main line extends eastward to Atlanta, Georgia, and comprises approximately 504 miles of pipe line mileage but parallel transmission lines and a branch line to Columbus, Georgia, bring the total length of the system to 1,300 miles. Gas is sold chiefly to 12 distributing companies. The First Mortgage, 4½ percent, 1951 bonds were held almost equally by the public and by institutions. The First Mortgage, 4½ percent, 1952 bonds were all held by institutions. The Adjustment Mortgage bonds of 1960 were held in approximately equal amounts by the public and by affiliates, a small portion being held by institutions, and notes in the amount of $800,000 were held by banks. Of the common stock of an aggregate par value of $5,189,776, $2,698,684 was in the hands of the public and the balance was owned by affiliates. The Adjustment Mortgage bonds were issued in 1936, pursuant to a reorganization plan, to holders of predecessor company's convertible 6 percent debentures, 1944, and to holders of filed and allowed claims on the basis of $500 of the new adjustment bonds, plus 48 shares of new Class A stock, for each $1,000 principal amount of old debentures and each $1,030 of claims. The Class A stock together with Class B stock was subsequently converted into the presently outstanding common stock.

The Texoma Natural Gas Company is engaged in the production and transmission of natural gas. The company owns a 24-inch main pipe line extending approximately 76 miles from Fritch, Texas, to a point near Gray, Oklahoma, where it connects with the transmission system of the Natural Gas Pipeline Company of America. The company produces all of its requirements from its own wells in the Amarillo gas field in the Texas Panhandle, and sells the major portion of the gas produced to the Natural Gas Pipeline Company of America. The company's properties also include a re-

finery at Fritch, Texas, for the purification of natural gas and the extraction of gasoline.

The outstanding securities of the Texoma Natural Gas Company consist of $18,750,000 principal amount of Gas & Pipeline Mortgage, 6 percent, 1946 bonds, all owned by Natural Gas Pipeline Company of America, and 10,000 shares of no-par-value common stock stated, at the book amount of $500,000, which are owned by a group of five affiliates.

The United Fuel Gas Company is engaged in the production, purchase, transmission and distribution of natural gas. The company's production operations are carried on in West Virginia and it sells principally at wholesale to distribution companies in West Virginia, Kentucky and Ohio, although it also supplies natural gas to many communities in West Virginia as well as in southeastern Ohio at retail. The 4 percent notes of the company, due 1940-1946, in the amount of $4,500,000 were all held by institutions. Other notes aggregating $14,535,000, were held by the Columbia Gas & Electric Corporation and all of the common stock was held by the same company.

The United Gas Pipe Line Company is engaged in the purchase, and transmission of natural gas. Gas is purchased principally at the wells in Texas, Louisiana and Mississippi, and is gathered and transported for sale to distributing systems of United Gas Corporation, to industrial corporations, and to others. The company owns 4,743 miles of main pipe lines in Texas, Louisiana, Mississippi, Alabama and Florida. The company, therefore, has long pipe lines serving a very wide territory. All of the outstanding securities of the company were held by affiliates, the debentures and common stock being owned by the United Gas Corporation, and the bonds being held by Electric Bond & Share Company.

The United Natural Gas Company is engaged in the production, purchase, transmission and distribution of natural gas and obtains its supply from northwestern Pennsylvania. The company supplies gas to several towns in Pennsylvania and a large quantity of gas is sold to Iroquois Gas Corpora-

tion, an affiliated company, for distribution in western New York. The only security the company had outstanding was common stock, all of which was held by the National Fuel Gas Company.

The Warfield Natural Gas Company is engaged in the production, purchase, transmission, distribution and sale of natural gas. The company operates approximately 500 miles of pipe line, including gathering and transmission mains, and supplies gas to a number of communities in the State of Kentucky, the principal community being Ashland. The company's principal customers are affiliated companies. The notes of the company outstanding in the amount of $9,790,000 as well as all of the company's common stock are held by the parent company, Columbia Gas & Electric Corporation.

Schedule 5-A—Schedule 5-A lists the bond and debenture issues of the companies included in Schedule 5 of which any portion was held by the public. The schedule also lists the bond issues of such companies which were outstanding in the hands of the public during a part of the period 1937-1939, but which had been retired before the end of that period. For each issue the schedule shows the name of the issuing company, a description of the issue, the total principal amount outstanding, the portion thereof held by the public and the ratings assigned by Moody's and Poor's publications. The schedule next shows the averages of high and low market prices for the years 1937 to 1939, inclusive, and for the first nine months of 1940, together with the approximate yields to maturity based thereon. This information is followed by data on market prices as of September 30, 1940, and yields to maturity based on such prices. The last two columns of the schedule show the respective current call prices for general and sinking fund purposes.

The first issue shown in Schedule 5-A consists of First Mortgage 4 percent Bonds, due 1951, of Arkansas Louisiana Gas Company. This issue, which carried Moody's and Poor's A rating, was offered to the public in 1936, as shown in Schedule 6, at a price of 98 to yield 4.18 percent to purchasers. On the basis of average high and low market prices the yield to investors was slightly less than 4.00 percent in 1937 and 1938, and 3.69 percent in 1939. The bonds

were retired in connection with refunding operations in October 1939, when the company sold privately one issue of short-term, and one issue of long-term, serial bonds at par to yield 2.75 percent and 3.50 percent, respectively, to purchasers.

The next issue listed is that of El Paso Natural Gas Company, consisting of First Mortgage 4½ percent Bonds, due 1951. These bonds were also offered to the public in 1936, as shown in Schedule 6, and were sold at a price of 98½ to yield 4.64 percent. The issue carried Moody's Ba rating and Poor's B** rating. The bonds were selling above par in 1937 and 1938 to yield 4.17 percent and 4.09 percent, respectively, but were retired in January 1939 with the proceeds of an issue of 3 percent Serial Notes and a new issue of First Mortgage 3½ percent Bonds, due 1953. The new bonds were sold privately at 99 to yield 3.59 percent to purchasers. In 1940 the company sold privately $3,000,000 principal amount of First Mortgage 3 percent Bonds, due 1955, at 98½ to yield 3.13 percent.

The next issue shown on Schedule 5-A is that of Houston Gulf Gas Company designated as First and Collateral 6's of 1943. These bonds were originally offered in April 1928 at 99½ in the amount of $11,000,000. At December 31, 1939, $4,238,000 principal amount was outstanding, of which $3,777,000 was held by the public. The bonds are indicated as carrying Moody's Ba rating and Poor's B** rating. Moody's rating was revised from Baa to Ba on October 28, 1939, but Poor's rating has not been revised.

The 6½ debentures, due in 1943, were originally offered in May 1928 at 99 in the principal amount of $8,000,000. They were convertible at par into 7 percent preferred stock, Series B, until March 31, 1938. The amount outstanding at December 31, 1939 was $1,850,000 of which $1,453,000 was held by the public. Moody's and Poor's ratings are reported as B and B*, respectively. Moody's rating on the debentures was also revised in conjunction with its revision of rating on the 6 percent bonds, in this instance the rating having been lowered from Ba to B on October 28, 1939 and, as above, with no change in Poor's rating.

As indicated in Schedule 5-A, the outstanding bonds and debentures of Houston Gulf Gas Company were called for

redemption on October 1, 1940, at 101. They were called in connection with proposed refunding operations of United Gas Corporation which, through United Gas Pipeline Company, owns a 99.6 percent interest in the common stock of Houston Gulf Gas Company. Inasmuch as notice of call was published prior to September 30, 1940, the September 30 bid price in each instance was the same as the call price. However, market prices for 1940 preceding notice of call averaged $102\frac{3}{4}$ for the bonds and $101\frac{7}{8}$ for the debentures, resulting in yields of 5.00 percent and 5.82 percent, respectively. These yields were somewhat lower than those for 1939 but were substantially below the corresponding yields of 5.75 percent and 6.58 percent for 1937.

The First Mortgage 4 percent Bonds, due 1952, of Panhandle Eastern Pipe Line Company were quoted on September 30, 1940, at $103\frac{5}{8}$, or $1\frac{1}{8}$ points above call price, resulting in a yield of 3.63 percent. These bonds, which carry both Moody's and Poor's A rating, were sold by public offering in March 1937 on a 4.23 percent yield basis, as shown in Schedule 6. However, the yield established for the remainder of that year, based on average market price, was 4.06 percent. The yield declined to 3.85 percent in 1938 and to 3.77 percent in 1939, and, as above indicated, was still lower in 1940. Of the $23,000,000 principal amount of bonds outstanding, holdings by the public amounted to $4,918,000.

The bonds of Southern Natural Gas Company listed in Schedule 5-A include two issues, consisting of First Mortgage $4\frac{1}{2}$ percent Bonds, due 1951, Baa and B** rating, and Adjustment Mortgage 6 percent Bonds, due 1960, B and B* rating. On September 30, 1940, the $4\frac{1}{2}$ percent bonds were quoted at $106\frac{5}{8}$, or $1\frac{5}{8}$ points above call price, resulting in a yield of 3.75 percent while the 6 percent bonds were quoted at $100\frac{1}{2}$ point above call price, resulting in a yield of 5.96 percent. The current yields on both bond issues are substantially lower than the 1937 yields of 4.70 percent for the $4\frac{1}{2}$ percent bonds and 7.44 percent for the 6 percent bonds. Public holdings of both the $4\frac{1}{2}$% and 6% issues constituted approximately one-half of the total principal amount outstanding.

It will be noted that the total shown in Schedule 5-A under the column "Held by Public", $19,411,523, is in agreement

with the total designated as Bonds, Debentures and Notes Held by the Public in the summary on Page 5 of Schedule 5.

An additional fact which should be mentioned concerning the issues listed in Schedule 5-A is that in each instance the trust indenture contains provisions for the gradual retirement of the issues through sinking fund operations.

Schedules 5-B and 5-C—These schedules show the individual holdings by institutions and affiliates, respectively, of bonds, notes and debentures of the companies included in Schedule 5.

Schedule 5-D—Schedule 5-D contains similar information with respect to preferred stock held by the public as was shown in Schedule 5-A for bonds and debentures of the companies listed in Schedule 5. However, Moody's publications do not assign ratings to capital stock issues; therefore, only Poor's rating is given.

The schedule shows that only two of the 25 companies listed in Schedule 5 had preferred stock issues of which *any* part was outstanding in the hands of the public, and the public held such a small portion of the preferred stock issues of Houston Gulf Gas Company that no market quotations for those issues were available.

It will be seen that the public held the entire amount of outstanding 7 percent preferred stock of El Paso Natural Gas Company, of which $600,000 appears to have been issued at date of organization in 1928 and the remainder through subsequent conversion of other securities. A yield of 6.36 percent is indicated for this stock on the basis of a September 30 bid price of 110. In this connection, it is of interest to note that the bid price for this stock was equal to the call price.

End of month bid prices on the preferred stock of El Paso Natural Gas Company ranged from 94 to 107 in 1937, 102 to 109 in 1938, and 108 to 111 in 1939. The dividend record on this stock discloses that dividends in arrears amounting to $26.25 per share were cleared up on June 22, 1936, since which date dividends have been paid regularly.

The total of $1,491,800, shown as the last figure in the column headed "Held by Public" on Schedule No. 5-D is

in agreement with the amount shown in the second column of the summary on Page 5 of Schedule 5 opposite Preferred Stock.

Schedule 5-E—It is believed that Schedule 5-E, which shows individual holdings by affiliated interests of preferred stock of the companies listed in Schedule 5, requires no comment.

Schedule 5-F—Schedule 5-F gives certain information relative to the common stock issues of the six companies included in Schedule 5 which had common stock outstanding in the hands of the public.

The schedule shows for each issue the name of the issuing company, the number of shares and book amount of common stock outstanding, the portion thereof *held* by the public, the par value, if any, and Poor's rating. Next are shown the earnings per share for the years 1937, 1938 and 1939, and for the latest twelve months for which reported; the averages of high and low market prices for the years 1937 to 1939, inclusive, and for the first nine months of 1940; and the earnings-price ratio, i.e., the percent of earnings per share to market price, for the periods indicated. Finally, there is shown for each issue the earnings-price ratio based on market price at September 30, 1940 and on latest earnings per share reported.

Market quotations could not be obtained for the common stock of Houston Gulf Gas Company as relatively few shares were held by the public. None of the common stock of Panhandle Eastern Pipe Line Company was held by the public prior to September 1939. The presently outstanding common stock of Southern Natural Gas Company has been outstanding only since its issuance in May 1939 in exchange for the Class A and Class B stock formerly outstanding. Accordingly, only three of the six common stock issues listed in Schedule 5-F have been held by the public throughout the period 1937-1940, namely, those of El Paso Natural Gas Company, Interstate Natural Gas Company, Inc., and Memphis Natural Gas Company.

The earnings-price ratios of the respective common stock issues for the periods and on the basis indicated in Schedule 5-F are set forth in the following summary:

Company	Common Stock Earnings-Price Ratios				
	1937	1938	1939	1940	9/30/40
El Paso Natural Gas Co.	13.79%	14.08%	10.60%	11.37%	11.70%
Houston Gulf Gas Co.	(No Market Quotations)				
Interstate Natural Gas Co.	9.90	10.02	8.88	9.08	8.79
Memphis Natural Gas Co.	16.63	13.96	15.74	14.84	13.68
Panhandle Eastern Pipe Line Co.	—	—	9.61	13.03	11.97
Southern Natural Gas Co.	—	—	18.14	20.37	18.25

Schedule 5-G—This schedule contains a list of the individual holdings by affiliates of common stock of the companies listed in Schedule 5. None of such common stock is held by institutions.

Schedule 6—Schedule 6 contains a compilation of bond issues sold by the natural gas companies listed in Schedule 5 during the years 1935 to 1940, inclusive. The issues are grouped according to Moody's ratings, and for each issue there appears the name of the issuing company, the approximate offering date, a description of the issue, principal amount of the offering, net cost to company and price to public. In addition, the schedule shows the distribution of holdings of those issues still outstanding among public holders, institutional holders, and affiliates.

Under "Net Cost to Company" are shown the net proceeds to the company per $100 of principal amount after underwriters' commissions and other expenses and in the adjoining column a percentage representing the annual cost of the funds borrowed calculated to maturity. Under "Price to Public" are shown the selling price to the public and in the adjoining column a percentage representing the annual yield to purchasers calculated to maturity.

The first issue shown in Schedule 6 is that of Arkansas-Louisiana Gas Company offered in July 1936, which consisted of First Mortgage, 4 percent bonds, due 1951 in the

amount of $10,000,000, with a rating of A. On this issue the yield to the public was 4.18 percent and cost to the company 4.62 percent. These bonds were refunded in September 1939 when, as shown in the lower portion of the schedule, $3,300,000 First Mortgage 2¾ percent Series A bonds due 1940-44 and $9,700,000 First Mortgage 3½ percent Series B bonds due 1945-54 were sold privately at par to yield 2.75 percent and 3.50 percent, respectively. The cost to the company was 3.01 percent on the 2¾ percent bonds and 3.59 percent on the 3½ percent bonds.

The Panhandle Eastern Pipeline Company in March 1937 issued $24,000,000 of first mortgage 4 percent *conds* due in 1952, with rating of A, at a yield of 4.23 percent and cost to the company of 4.46 percent. These bonds were selling to yield 3.63 percent at September 30 and the market price was above call price at that date.

The Southern Natural Gas Company, in November 1936, issued $15,000,000 principal amount of first mortgage 4½ percent bonds due in 1951, rating Baa, at a yield of 4.50 percent and net cost to the company of 4.85 percent. At September 30 these bonds were selling at a price in excess of call price on the basis of a yield of 3.75 percent. In *October* 1937, Southern Natural Gas Company negotiated the private sale of $650,000 principal amount of 4½ percent first mortgage Bonds due in 1952 at a yield to purchasers of 4.71 percent. The proceeds were deposited with the corporate trustee to be drawn against for expenditures made for bondable property.

The El Paso Natural Gas Company, in June 1936, issued first mortgage 4½ percent bonds due 1951, rating Ba, in the amount of $7,500,000, at a yield to the public of 4.64 percent and cost to company of 5.06 percent. Also in June 1936, the company sold $3,750,000 principal amount of 4¾ percent convertible debentures, due in 1946, at a yield to investors of 4.75 percent and cost to company of 5.38 percent. The debentures carried Moody's B rating. It is reported that the conversion privilege was exercised by holders of virtually the entire debenture issue, such conversion resulting in the issuance of approximately 225,000 of the 600,000 presently outstanding shares of the company's common stock. The same company in October 1937 sold privately an issue of $1,200,000 first mortgage 4 percent

bonds due in 1952 at a yield to purchasers of 4.20 percent, the purpose of the issue having been to reimburse the company's treasury for construction expenditures previously made and to provide additional working capital.

In connection with refunding operations the El Paso Natural Gas Company in December 1938 sold privately a $6,000,000 issue of first mortgage 3½ percent bonds, due in 1953, at a yield to purchasers of 3.59 percent. The proceeds from this issue, together with funds obtained through the issuance of 3 percent Serial Notes in the amount of $4,000,000 to Chase National Bank, were applied to the redemption on January 16, 1939, of the outstanding principal amount of bond and debenture issues sold in 1936, 1937 and 1938, and to retire $660,000 of short-term notes and for other corporate purposes.

In June and July 1940 the El Paso Natural Gas Company sold *preivately* two issues of first mortgage 3 percent bonds due in 1955 in the aggregate principal amount of $3,000,000 to yield 3.13 percent. The proceeds from these issues are reported to have been used for the retirement before maturity of $1,500,000 of bank loans and for other corporate purposes.

The last group of issues shown in Schedule 6 includes all issues which were sold privately during the period 1935-1940. It will be noted that Moody's assigns no rating to issues that are sold in this manner.

The first item shown is the first mortgage 4 percent bond issue, due 1952, of the Mississippi River Fuel Corporation sold in February 1937 to yield 4 percent at an assumed price of par to purchasers.

The issues sold privately by El Paso Natural Gas Company and Southern Natural Gas Company have already been referred to above.

The Cities Service Gas Company in December 1938 issued $20,000,000 principal amount of 3¾ percent first mortgage bonds due serially in the years 1947-54. The bonds were sold privately at par to yield 3.75 percent. At the same time the company negotiated bank loans in the amount of $15,000,000 secured by an equal principal amount of first mortgage 3¼ percent bonds due 1940-46.

The Northern Natural Gas Company, in August 1939, issued first mortgage 3¼ percent bonds due 1956 in the principal amount of $16,000,000 at a yield to the public of 3.25 percent, and cost to the company of 3.35 percent. These bonds were issued for refunding purposes. At the same time the company issued unsecured promissory notes to the Chase National Bank in the amount of $6,000,000 carrying interest at 2⅛ percent and maturing over the period 1940-1946. It was reported that the proceeds from these unsecured promissory notes were to be used as follows: $3,000,000 for construction of a 240-mile pipe line from Sioux City, Iowa, to Minneapolis; $1,200,000 for compressor station property, lateral pipe lines, distribution system properties of subsidiaries and development costs, all directly incidental to the pipe line; and $1,200,000 to defray cost of additions and betterments to the company's existing property, including distribution systems of subsidiaries, etc.

The issues of Arkansas-Louisiana Gas Company in September 1939 have already been described.

In conclusion, with respect to Schedule 6, there are two additional facts which should be mentioned. In the first place, a characteristic feature of natural gas company bond issues, arising from the fact that the business of such companies is based on exploitation of a wasting resource, is their relatively short life to maturity. As will be seen from the schedule this life generally does not exceed 15 years, whereas for electric utility bond issues the life is generally 25 or 30 years. For example, of the 15 issues listed in Schedule 6, eleven have a 15-year life to maturity, one has a 10-year life, and three have serial maturities. Of these three, the last maturity date is 16 *years* from date of issue in one instance, 15 years in another instance, and only five years in the case of Arkansas-Louisiana Gas Company's first mortgage 2¾ percent bonds due 1940-44.

Finally, in the case of each of the bond issues listed in Schedule 6, the trust indenture contains provisions relative to sinking fund requirements with a view toward the gradual retirement of the bonds over the life of the issue. The only exceptions that will be noted are the three issues having serial maturities, and a provision for serial maturities accomplishes the same purpose as redemption through sinking fund operations.

In the preceding discussion with respect to the ownership, issuance, prices and yields of securities of natural gas pipeline companies, reference has been made to the limited data available regarding yields on securities of such companies because of the *predominant* ownership of their securities by affiliated interests. Moreover, the fact that ten of the fifteen bond issues sold by such companies in the period since 1935 were disposed of privately by negotiation with institutional investors has had the effect of limiting the number of bonds of representative companies actually traded in on the market. Consequently, with only 5.9 percent of bonds, debentures and notes, 5.9 percent of preferred stocks, and 3.4 percent of the common stocks of a representative group of 25 companies being outstanding in the hands of the public and traded in on the market, it follows that caution must be exercised in relying upon the limited data available with respect to market appraisal of securities of natural gas pipe-line companies in attempting to ascertain the opportunity cost of capital under existing market conditions for particular companies engaged in natural gas pipe-line operations.

Corporate Affiliations of Canadian River Gas Company, Colorado Interstate Gas Company, and Colorado-Wyoming Gas Company and Recent Financing by Affiliated Companies. Chart 4—This chart is presented for the purpose of showing the corporate affiliations of the companies involved in the present proceedings. The chart shows that all of the common stock of Canadian River Gas Company is owned by Southwestern Development Company whose stock, in turn, is owned by Consolidated Oil Corporation (51 percent), and by The Mission Oil Company (47.28 percent).

It will be noted that the Southwestern Development Company also controls the Amarillo Oil Company and the Clayton Gas Company, two customer companies of Canadian River Gas Company, and has a substantial minority stock interest in Natural Gas Pipeline Company of America and in Texoma Natural Gas Company. The Natural Gas Pipeline Company of America purchases 25 per cent of its gas requirements from Colorado Interstate Gas Company which in turn obtains its total requirements from the Canadian River Gas Company, and deliveries by Colorado Interstate

Gas Company are made to Natural Gas Pipeline Company of America through facilities leased from Texoma Natural Gas Company.

It will also be noted that two customer companies of Amarillo Oil Company, itself a subsidiary of Southwestern Development Company, are also wholly-owned subsidiaries of the latter company. The two customer companies referred to are the Dalhart Gas Company and the Panhandle Pipe Line Company. Another wholly-owned subsidiary of Southwestern Development Company is the Amarillo Gas Company which purchases its requirements from the Panhandle Pipe Line Company.

Further reference to Chart 4 will show that the Southwestern Development Company owns a 42.5 percent stock interest in Colorado Interstate Gas Company. An equal percentage of the latter's stock is owned by Standard Oil Company (New Jersey), and the remainder is held by Public Service Company of Colorado. Standard Oil Company (New Jersey) also owns a substantial minority interest in Natural Gas Pipeline Company of America.

With respect to Public Service Company of Colorado it will be noted that its common stock is 99.99 percent owned by Cities Service Power & Light Company. The latter company's stock is owned to the extent of 91.88 percent by the Cities Service Company, although such stock has been pledged by Cities Service Company under an indenture securing its outstanding debentures, and voting rights therein have been relinquished to the trustee under that indenture. It will also be seen that the Cities Service Company owns a substantial minority interest in the capital stock of Natural Gas Pipeline Company of America.

Further examination of Chart 4 will disclose that Public Service Company of Colorado is the sole owner of all outstanding stock of Colorado-Wyoming Gas Company. The latter company's capital stock, consisting of 50,000 shares without par value, is reflected on its books at $1,501,000, and the company has no funded debt. Not shown on the chart is the 100 percent ownership by Public Service Company of Colorado of Cheyenne Light, Fuel & Power Company, which is engaged in the production and distribution of electric energy and in the purchase from Colorado-Wyo-

naing Gas Company) and distribution of natural gas in Cheyenne, Wyoming.

Schedule 7—This schedule contains certain information with respect to recent financing by companies affiliated directly and indirectly with the companies involved in the present proceedings. The data in Schedule 7 disclose financing by Consolidated Oil Corporation, Public Service Company of Colorado, Standard Oil Company (New Jersey), and Southwestern Development Company from 1936 through September 1940.

Consolidated Oil Corporation—The first issue listed for this company was sold in June 1936 and consisted of $50,000,000 of 3½ percent Debentures due 1951 which were offered to purchasers at 98 to yield 3.67 percent to maturity. In August 1938 the company negotiated the private sale at par to Equitable Life Assurance Society of 3⅜ percent Debentures due 1950 in the amount of $25,000,000.

Public Service Company of Colorado—In November 1939 this company offered publicly a $40,000,000 issue of First Mortgage 3½ percent bonds due 1964 at 102 to yield 3.38 percent, and a $12,500,000 issue of 4 percent Debentures due 1940 at 102 to yield 3.76 percent.

Standard Oil Company (New Jersey)—This company in May 1936 issued $85,000,000 principal amount of 3 percent Debentures due 1961 of which $30,000,000 were offered publicly and $55,000,000 were sold privately to Rockefeller Foundations. The price to purchasers for the 3 percent Debentures was 98, resulting in a yield to maturity of 3.12 percent. In July 1938 the company issued $50,000,000 of 2¾ percent Debentures which were offered at 99 to yield 2.83 percent, and $35,000,000 of 1¾ percent-2½ percent Serial Notes offered at par of which $4,000,000 were *sold* to the Rockefeller Institute for Medical Research and the remainder were sold to the public. These notes were redeemed on July 2, 1940, funds for their redemption having been obtained from the issuance of $35,000,000 1¼ percent-1½ percent Promissory Notes sold at par. Of the latter notes $14,000,000 consisted of 1¼ percent notes due July 1, 1943 and 1944 which were sold privately to two purchasers, and $21,000,000 consisted of three 1½ percent notes due July 1, 1945, 1946 and 1947, respectively, evidencing borrowings from two banks.

Southwestern Development Company.—On July 1, 1936, this company obtained a 2-4 percent loan secured by collateral and due 1937-1941, from the Guaranty Trust Company of New York. The collateral consisted of certain of the company's holdings of securities in natural gas companies. Subsequently a reduction in interest rate from 4 percent to 3½ percent and an extension of maturity date were obtained with approval of the Securities and Exchange Commission and a new 3 percent collateral note, in exchange for the outstanding 3½ percent note, was issued on August 1, 1939.

In December 1936 and 1937 the company issued its unsecured 4 percent notes to holders of its common stock in payment of dividends at the rate of $43.18 per share in 1936 and $50.00 per share in 1937. The notes issued in December 1936 were redeemed on January 3, 1938.

On November 1, 1937, the company negotiated a $3,292,000 collateral loan, 4 percent, due 1939-1943, from the Guaranty Trust Company of New York. The collateral consisted of 6 percent First Mortgage and Collateral Trust Sinking Fund Gold Bonds, due January 1, 1945, of South Plains Pipe Line Company (assumed by West Texas Gas Company, a wholly-owned subsidiary of Southwestern Development Company). The Southwestern Development Company obtained approval of the Securities and Exchange Commission of the sale of $3,150,000 principal amount of the above 6 percent bonds to the West Texas Gas Company and applied the proceeds to the discharge of the unpaid balance of its 4 percent collateral loan dated November 1, 1937. The West Texas Gas Company had obtained the funds with which to purchase the bonds from Southwestern Development Company through a 3 percent collateral loan, due January 1, 1945, made by the Guaranty Trust Company of New York.

The most recent financing by the Southwestern Development Company was undertaken in January 1940 when the company arranged with the Guaranty Trust Company of New York a 3 percent collateral loan, due 1940-1945, in order to redeem the 4 percent unsecured notes issued for dividend purposes in December 1937 and to liquidate the balance of

the 3 percent collateral loan dated August 1, 1939 and due July 1, 1944."

(Vol. LXXIV, pp. 10873-10929.)

* * * * *

Q. Mr. Knapp, since the time of the completion of your rate of return study, Exhibit No. 225 and Exhibit No. 225-A, I will ask you whether you have had the opportunity to learn about the refunding operations of the Panhandle Eastern Pipeline Company that took place sometime during the month of January 1941.

A. I have.

Q. Could you explain briefly what additional information you obtained concerning those matters?

A. The Panhandle Eastern Pipe Line Company on January 30, 1941 made a public offering through an underwriting group of $12,000,000 principal amount of 3 per cent Series B first mortgage and first lien bonds, dated November 1, 1940 and maturing November 1, 1960. These bonds carrying Moody's rating were offered to the public at a price of 102 per cent of principal amount to yield 2.87 per cent to purchasers.

In conjunction with the public offering of Series B bonds, the company sold privately $6,250,000 principal amount of Series A bonds to four banks and an insurance company. The Series A bonds were dated November 1, 1940 and are to mature serially in equal annual instalments on November 1, 1946 to 1950, inclusive, with interest rates ranging from 1.65 per cent to 2.30 per cent according to maturity.

At the same time the company arranged for the private sale of $5,000,000 face amount of Serial notes due in four equal instalments on November 1, 1942 to 1945, inclusive, with interest rates ranging from .75 per cent to 1.50 per cent according to maturity.

It was reported that the proceeds of the three issues were to be applied to the reduction of all of the company's outstanding $22,500,000 principal amount of first mortgage and first lien Series A four per cent bonds due March 1, 1952.

Q. Does that complete your investigation as to that particular refunding operation?

A. It does.

(Vol. LXXXIII, pp. 12301-12302.)

* * * * *

Q. As I gather the plan of your presentation of rate of return study, it consists in effect of two parts; one, Part 1 which might be called general background material; and then Part 2 which is that which is directly and particularly applicable to the case in which the exhibit is being offered.

A. That is in connection with natural gas companies, yes.

Q. Yes.

A. Correct.

Q. That is, you would use this Part 1 which is in Exhibit 225, in any rate case whether electric or gas, before the Federal Power Commission?

A. That is true.

Q. And so I say it consists of what I say is back-ground material. I don't know what you call it.

A. I have the same view of it.

Q. It is a lot of general information that you feel is pertinent but the direct and particular data on natural gas companies is contained in Part 2?

A. Well, I don't mean in answering that question to *minimunize* the significance of Part 1. I think Part 1 is essential to an understanding of Part 2.

Q. You would use it, though, in an electric case just the same as in a gas case?

A. That is correct.

Q. As I understand it, in presenting these studies you do not express an opinion as to what percentage of return a fair rate of return to be?

A. That is true. I have not been instructed to recommend a specific rate of return. I have merely been instructed to prepare a study which contains the facts and factors which should be considered in arriving at such a determination on the part of the Commission.

(Vol. LXXXIII, pp. 12307-12308.)

* * * * *

Q. Now, on that schedule, Page 8 of Schedule 1, there is no company that is engaged solely in the gas business, either manufactured or mixed gas?

A. That is correct.

Q. Then with respect to the rating AA on the following page, that is again true, is it not?

A. It is.

Q. And the same thing is true with respect to rating A bonds on the succeeding page?

A. That is correct.

Q. And then when we come to the Baa bonds I believe the only company that is in the gas business solely is the Peoples Gas, Light and Coke Company?

A. That is correct.

Q. Now, that is the distributing company that distributes mixed gas in the city of Chicago, Illinois?

A. It is.

Q. And is one of the largest gas distributing companies in the United States, is it not?

A. I believe it is the largest mixed gas distributor.

Q. At any rate, it is in the second largest city in the United States?

A. That is correct.

Q. So that Moody's, in selecting for their investors service, a group of the bonds of the four ratings shown, have included only one company that receives its revenue only from the sale of gas?

A. That is so.

Q. And that happens to be in the lowest rating of those groups?

A. Yes.

(Vol. LXXXIII, pp. 12311-12312.)

* * * * *

Q. I take it it is your opinion that cost of money as represented by bonds sold by a natural gas pipe line company is the best source of information as to the cost of that capital for such companies?

A. In a general way the answer is yes.

Q. In answer to my question a little while ago you said that my question assumed there were no natural gas pipe line bonds available and that was a premise to your dis-

cussion, so from that I adduce that you consider the best source of comparison what actually has been done with natural gas pipe line bonds by companies engaged in that business and actually issued?

A. I answered that question by saying in a general way, yes. My reason for that was simply that if we were to encounter a condition where bonds of natural gas pipe line companies were outstanding in the hands of the public and were selling above call price but were not refunded; when an opportunity for refunding was here, then the figures that you would get as yields on natural gas pipe line company bonds would not necessarily represent the lowest bond money cost available.

Q. Well, Chart 1 shows not the bond money cost to the companies when the issue was put out, but the investors appraisal of the return on market price, doesn't it?

A. It does; it shows yield to the public.

Q. You could do the same thing with respect to natural gas pipe line bonds if they were sold in the market?

A. Yes, but it would be necessary to analyze market transactions to determine upon what basis the bonds were being traded as to price.

(Vol. LXXXIII, pp. 12316-12317.)

* * * * *

A. That is right. Chart 1 contains a list of what purports to be 120 bonds of three classes of industry, public utilities, industrials, and railroads. The yields are shown by rating groups. In Chart 4 we take only the bonds of the forty public utilities and show those bonds by rating groups.

Q. Here again the only company that is exclusively in the gas business is the Peoples Gas, Light & Coke Company?

A. It is the same company that appeared in the other place.

Q. In neither of those lists has Moody included any natural gas pipe line company bonds—

A. That is correct.

(Vol. LXXXIII, p. 12321.)

* * * * *

Q. You have in addition to those which you mentioned, those three which you mentioned as being not of such good

investment opportunities; the companies that distribute electricity in Boston, Cleveland, Chicago, Baltimore, Detroit, and Hartford, Connecticut. Isn't that as conservative, sound and excellent a group of electric operating utilities as you can find?

A. As I said before, if you were to give consideration to the quality of issues in your compilation that was presented to me as to common stocks and then were to do the same thing as to bonds, then the compilation might have some significance, but otherwise I just can't express any opinion about the results that you have obtained here.

Q. You haven't answered my last question as to the character of the group of electric companies in those cities I mentioned.

Will you read the question so Mr. Knapp can answer it, Mr. Reporter?

(The question referred to was read by the reporter, as set forth above.)

By Mr. Dougherty:

Q. Do you understand the question, Mr. Knapp?

A. Yes, sir. If you will just permit me to consider that a moment.

Q. Yes.

A. I consider that group as a good quality group on the average.

Q. You could find few companies that are better?

A. Mr. Dougherty, all of the companies that you can find are on this schedule as to my knowledge.

Q. Well, now, you then attribute my attempt at mathematical computation as an interesting phenomena if true?

A. That is correct.

Q. Will you read them off for the years I have indicated so we will have them in the record just in case somebody agrees with me and not with you?

A. How would you like these figures read?

Q. Suppose you let me read them and you can confirm them.

A. Very well.

Q. As shown on Schedule 6, the weighted average of bond yields for public utility companies, and as shown on

Schedule 8, the average yield for common stocks shown on that schedule for the years as I have indicated are as follows:

For 1929, bonds 5.37; stocks 4.06; total 9.43;

For 1930, bonds 5.11; stocks 4.59; total 9.70;

For 1931, bonds 4.65; stocks 5.95; total 10.60;

For 1932, bonds 5.66; stocks 7.74; total 13.40;

For 1933, bonds 4.95; stocks 7.02; total 11.97;

For 1934, bonds 4.81; stocks 7.57; total 12.38;

For 1935, bonds 3.92; stocks 7.32; total 11.24;

For 1936, bonds 3.56; stocks 5.89; total 9.45;

For 1937, bonds 3.56; stocks 6.77; total 10.33;

For 1938, bonds 3.49; stocks 7.42; total 10.91;

For 1939, bonds 3.45; stocks 7.04; total 10.49.

(Vol. LXXXIII, pp. 12335-12337.)

* * * * *

Q. Now, if a company has no debt or no preferred stock, normally the earnings-price ratio on that company would be lower than if it did have debt and preferred stock ahead of it?

A. Normally, yes.

Q. That is what you get, then, is a general overall picture where there is any common stock outstanding?

A. That is right.

Q. And where you have bonds or preferred stock you have from the earnings-price ratio, you get the position—the inferior position that the common has?

A. If you don't intend to characterize the word "inferior." Common stock, of course, is inferior to bonds and preferred stock.

Q. I will say "subordinate" instead of "inferior."

A. Subordinate, yes.

Q. So where you have a company that has only common stock outstanding, you really get a better overall picture of investor appraisal of that company's position from the

common than you do from the common where there are these issues of bonds and preferred stock?

A. Well, I don't agree as to that, Mr. Dougherty, about your statement that you get a better overall picture. If by that you mean that your overall rate, cost of money is lower, I don't agree.

Q. I didn't mean it would be lower in this sense that you have considered the cost of money for bonds and cost of money for preferred stock and cost of money for common, but I was directing my question solely to the significance of the earnings-price ratio of common stock between a company that had nothing but common and a company that had both bonds and preferred stock outstanding.

A. Generally speaking, if you limit your comparison to common stock alone, you will find a lower earnings price ratio for the company which had only common stock outstanding.

Q. Now, Schedule 9 which is headed "New Corporate Issues in the United States, all Public Issues and Public Utility Issues," is it not a fact that that schedule shows that of the financing done since 1934, the principal amount has been refunding rather than for new capital?

A. Yes.

Q. And I note that on Schedule No. 9, Page 4, you quote from the Commercial and Financial Chronicle—or, rather, you don't quote from it, you refer to it and make this notation, that that periodical does not include natural gas pipe line companies that are not engaged in retailing to general consumers within the category of public utility issues?

A. That is true.

Q. Do you know why that Commercial and Financial Chronicle does make that classification of natural gas pipe lines?

A. No, I do not know why.

Q. On Schedule 10, where you have a listing or compilation of electric operating utility bonds sold from 1935 to 1939, I take it those are, as you say, only electric companies and do not include any companies that are engaged solely in the gas business?

A. That is correct.

Q. And again on—well, all through Schedule 10—I should say Schedule 10-A, that same situation holds, does it not?

There are no companies there that are engaged solely in the gas business?

A. That is correct.

Q. Where you have shown in these tables the yield to the purchaser, that I take it does not represent exactly the cost of the bond money to the company?

A. It does not represent cost to the company.

Q. So that in order to know what the cost to the company would be there would have to be something added to what you show as yield to the purchaser?

A. That is correct.

Q. In all of Schedule 10-B, it again contains no company in the gas business only?

A. That is correct.

Q. The same thing is true with Schedules 11 and 11-A?

A. That is correct.

Q. Are there any bonds outstanding of the Indianapolis Power and Light Company, which company is referred to on Schedule 12, as having recently sold an issue of common stock in 1940?

A. I can't imagine it not having bonds, but let me see. I have here the Banking Quotation Record, issue of February 6, 1941, which on the New York curb exchange quotations indicates that the Indianapolis Power and Light has 3¾ per cent bonds due in 1970 outstanding.

Q. Was the quotation then about par, or what was it?

A. January 31, 1941, bid 107, ask 108.

Q. And what yield would that result to the purchaser?

A. That would be a yield of somewhere between 2.85 and 2.90 per cent.

Q. Now, having that yield in mind and having in mind the earnings-price ratio as shown on Schedule 12 for the Indianapolis common stock, which you show as 8.4 in comparison of those two figures, it would indicate, would it not, that the common stock purchaser is demanding almost three times return on his purchase of common stock as the purchaser of bonds of the same company demands for interest yield?

A. Well, you will note on Schedule 12 that for the year 1939 Indianapolis Power and Light had only 33.95 per cent of its gross income available for common stock. I think that explains that high ratio.

Q. But in that situation the statement I made is correct, with the situation of that company?

A. Yes. If its bonds are reasonable in proportion to the property account, there is no reason why the bonds could not have a good rating and a good yield.

Q. So you have all the way through this situation of investors' appraisal a fluctuating rate which is demanded depending upon the percentage of bonds, percentage of common stock, amount available of gross for fixed charges on bonds and dividends on common?

A. Oh, yes, that is one of the indicators. I might put it this way: coverage is one of the indicators of risk.

(Vol. LXXXVII, pp. 12339-12343.)

* * * * *

Q. Well, I note on Chart 12 where you show the trend of corporate earnings for industries, utilities and railways, that you have not put on that chart any separate line with respect to the gas industry, either those engaged in distribution of natural or mixed gas, or natural gas pipe line companies.

A. I would like to do that right now.

Q. That's okay with me.

A. I refer you to my direct testimony at the top of Page 46 relating to Chart 12, at which place you will see a comparison of five electric utilities—the five electric utilities included among the thirteen utilities on Chart 12, with the thirteen utilities as to index as to net earnings based on the year 1926 as equal to 100 per cent.

Now, statistics are available for the natural gas industry from which an index based on the year 1931 as 100 per cent can be constructed. In order to make a comparison, however, it will be necessary to reconstruct the index of earnings for the thirteen utilities and the five electric utilities shown on Page 46 of the written testimony to a 1931 base year.

I have done that and I will read the comparative figures for the electric utilities and for the natural gas industry into the record.

Q. Will you first state why you have to reconstruct it for the year 1931?

3. Because the available data on the natural gas industry does not go back beyond that year.

Well, isn't that also because of the fact that most of these long distance pipe line companies have come into existence since 1928 and therefore that has created a new type of business in the natural gas industry that did not exist prior to that date?

A. Yes, to the extent that you refer only to pipe line companies. Of course, I think there has been distribution of natural gas probably for a few years, at any rate, prior to 1928.

Q. I can assure you it has been since 1880. You go ahead and read the figures.

A. The figures, then, are as follows:

1931, the net earnings of the five electric utilities—and when I refer to electric utilities hereafter I refer to those five—were for 1931, the index for that year being 100, the index for both the electric utilities and the natural gas industries would be 100.

In 1932 the index for electric utilities was 78; for natural gas industry, 86.

For 1933, for electric utilities, 65; for natural gas industry, 53.

For electric utilities in 1934, 62; for natural gas industry, 61.

For the electric utilities in 1935, 69 and for natural gas, 110.

For 1936, electric utilities, 74; for natural gas, 135.

In 1937, for electric utilities, 86; for natural gas industry, 146.

For 1938, electric utilities, 76, and for natural gas industry, 121.

For 1939, electric utilities, 89, and for natural gas, 141.

Q. Now, you have used there under the electric utilities the five same companies each year?

A. That is correct.

Q. So that what you get is a relationship of the—is it net or gross?

A. Net income.

Q. —of the net earnings of five companies. Now, what you have got so far as the natural gas industry is concerned, however, is all companies reporting to the American Gas Association?

A. That is correct.

Q. And let me point this out—let me ask you here if you know about this: that within the period of time that you speak, the Detroit changed from—changed over from manufactured gas, so that it almost tripled between 1935 and 1940.

A. That is correct.

Q. And that would all have—what you are doing in that comparison is comparing five companies and only the natural growth of those five electric companies and you are comparing with that the natural gas industry which has multiplied, company by company, and taken over a lot of business that was formerly under the manufactured gas business, haven't you—what you are attempting to do?

A. That is true, Mr. Dougherty, but the mere growing of an industry does not increase its growth of net income. It may increase its gross revenue.

Q. Well, when you have three pipe lines instead of one, and each one of them is making money, you will have more net income from the three than you would have from the one?

A. In talking about the pipe line companies, yes.

Q. That's what I am talking about.

A. Yes.

Q. Do your figures for 1931, 1932 and 1933 include all of the natural gas business that was done in these communities that subsequently changed to natural gas?

A. It does.

Q. You have added them in?

A. I haven't added them in, the American Gas Association did that.

Q. What compilation of statistics have got that in?

A. The annual statistics of the natural gas industry in 1939, statistical bulletin No. 41, dated October 1940, American Gas Association.

Q. Now, that table you are speaking of lumps both manufactured gas revenues and net income along with that from the natural gas business, doesn't it; that is, they take for the years prior to the time these companies that formerly were distributing manufactured gas and put those revenues in and carry them all the way forward through to 1939 in the same manner as if they had been received for natural gas?

A. That is correct, yes.

Q. So after all, what you have got in the figure you have read from is a combination of revenues from manufactured gas for a number of years and then revenues for natural gas for a succeeding number of years?

A. That is correct.

(Vol. LXXXIII, pp. 12345-12349.)

* * * * * *

Q. Then your next Schedule No. 2 which is the statistics on dollars which you referred to before, that of course would reflect such additional sales as these pipe lines made to industrial customers and new groups where no gas had been distributed before?

A. You mean for natural gas?

Q. Yes, for natural gas.

A. Yes, I think that is correct.

Q. So we have had during that last decade a condition in the natural gas industry of growth that was based on different facts than growth that might have taken place in the electric industry in that same period?

A. Well, I just don't know what—

Q. I mean this: In 1930 practically all of the communities that resided in the United States did have electric service and the growth that took place in that period would be increased consumption by the people who lived there or by the industries there rather than the installation of electric service in the areas where there had been no such previous service?

A. Well, except for the increase in rural sales, that might be so.

Q. But there is a different situation of natural gas where large cities such as Denver, Detroit and others that formerly had distributed manufactured gas, then changed

over to natural gas, and that would bring a large group of customers in in a short period of time for the total number of customers being served with natural gas?

A. That is right.

(Vol. LXXXIII, pp. 12364-12365.)

* * * * * *

Q. So again here these statistics represent a growth of new business as distinguished from merely a growth of territory previously occupied?

A. I just don't quite get your distinction there. Do you mean growth or new business?

Q. Business in addition, new business in territories not previously served by natural gas as distinguished from additional sales by companies occupying territories and selling gas there during that same period.

A. Of course, these figures give effect to both situations.

Q. Oh, yes, quite so, but I am saying that a substantial part of it represents the new sales of gas where natural gas had never been sold before.

A. Yes, but we don't have a situation where natural gas is supplanting some form of service other than gas. We still have gas in there and to that extent your sales of natural gas in volume can't be said to reflect increases of totally new business that was never had before.

Q. You are familiar with the fact, are you not, Mr. Knapp, that the volumes of natural gas sold by the distributing companies which formerly distributed manufactured gas increased substantially within the period of the first five years when the changeover was made?

A. That is undoubtedly true. What I am point out is there was some volume there to begin with.

A. Oh, yes, but if those companies had continued to distribute manufactured gas, those increases would not have resulted, would they?

A. Probably not, because natural gas is cheaper than manufactured gas.

Q. And you bring in house heating which was not done formerly?

A. That is correct.

Q. You take the trends in manufactured gas in cases

like Consolidated Edison in New York. They have not shown the same type of increase from 1936 to 1939 as these statistics indicate for natural gas, have they?

A. That is true.

Q. It is the changeover to natural gas that increases the volume. On that same chart you show transported in interstate commerce three times as much gas in 1939 as in 1926, do you not?

A. That is correct.

Q. That indicates long-distance transportation?

A. That is right.

Q. And again you go from 23 states where gas was consumed in 1926 to 35 states in 1939. That again indicates, does it not, a tremendous area where natural gas was never served before and is now being served?

A. That is correct.

Q. And those are the significant factors in interpreting the statistics, are they not?

A. The statistics reflect that factor, if you want to call it a factor.

(Vol. LXXXIII, pp. 12367-12370.)

* * * * *

Q. Panhandle Eastern, whose bonds you said were rated A, and has this low rate of interest, around three per cent on its long-term debt, has a reflection in the people who buy its common stock, however, of rather a high earnings-price ratio?

A. Well, there are several reasons for that, Mr. Dougherty.

Q. Well, first the fact is so?

A. It is so.

Q. I assume if there were no reasons for it it would be something different.

A. I would like to explain that reason right now in answer to your question.

Q. That's all right, go ahead.

A. In view of Panhandle Eastern Pipe Line Company's earnings record, it has not been a very impressive record. It was not until 1936 when the Detroit market was opened to the company that it began to even show a profit. In the second place, the company has outstanding 11 million dollars in par value preferred stock of which with respect to

40 million dollars the stock is participating with common stock in earnings available for distribution as dividends. In the third place, Panhandle Eastern has been involved in litigation for the last several years with respect to its control.

Q. Now, with respect to the market situation, there is no indication now that it has—having this large market around Detroit, that its business will not be maintained on the same level which it has experienced for the last couple years.

A. That may be, but its record has not been consistent in the past.

Q. Well, it is consistent in this fact that it was low for a long while and as soon as it got the market, why, it started to boom rather rapidly, didn't it? That is, you have to more than just see the figures on paper to understand what the situation is, don't you, Mr. Knapp?

A. I think an investor will understand it is better off with its Detroit market than it would be without it, but at the same time, the circumstances peculiar to that company which I have pointed out operate in my opinion to keep that earnings-price ratio above the level which it could attain.

Q. Now, with respect to Memphis Natural, there is a company that has very little debt outstanding and correspondingly its per cent of gross revenues that would be available for dividends on common stock would be relatively high, wouldn't it?

A. That is true.

Q. That is, having in mind the discussion we had this morning about the electric company common stocks.

A. That is true, but with respect to Memphis Natural gas, I'd like to read into the record its record of earnings per share since 1929.

1929, 7 cents; 1930, 43 cents; 1931, 66 cents; 1932, 36 cents; 1933, 33 cents; 1934, 25 cents; 1935, 22 cents; 1936, 35 cents; 1937, 77 cents; 1938, 55 cents, later revised to 64 cents; and 1939, 65 cents; a record which has certainly been remarkable for its lack of stability during this period of time.

Q. Now, of course, you recognize that Memphis Natural did not begin business until about 1929—1928—along in there?

A. Yes, I have a note here that its 18-inch line from the Monroe field to Memphis was constructed in 1928.

Q. So you wouldn't expect it to start off and make the same money in the first six months that it makes after its market has been built up for six or seven years?

A. No, I don't expect it in the first year.

Q. As a matter of fact, if you would examine the records of all of these natural gas pipe line companies you would find that the first two or three years have been lean years in beginning to build up the line and it has taken four or five years to get the load on the line?

A. That may be true with respect to the first few years, but these conditions I have pointed out have persisted for a longer period of time than that.

Q. It took some of them longer to build up the market than others?

A. Whatever the cause was, the earnings record was not a favorable one.

Q. Of course, all of these earnings are included in these statistics which you have quoted from the American Gas Association which shows this tremendous growth in earnings during the last several years?

A. Well, I don't know how that relates to these particular companies.

Q. You don't know whether they report or not to the American Gas Association?

A. Oh, yes, the figures are included in there, but the effect on the total is something I am not prepared to say.

Q. Well, I say, they are included. Now let's take the El Paso Natural. What is your explanation of instability for that company?

A. Well, taking a look at the record on that particular company, we find that that company was unable to pay its preferred dividends from 1932 to 1936, but it did pay those dividends clearing up arrears in 1936. The record shows that the initial dividend on the common stock was paid on December 29, 1936, that the next dividend was paid in 1937, $1.80 regular, 20 cents special, and that following that date it paid 50 cents quarterly through 1938 and continued paying that dividend through 1939, and again we have a company whose earnings record has not been too favorable.

Q. That company started business in 1932, didn't it?

A. I don't think so. According to my information it constructed its pipe line to El Paso, Texas in 1929.

Q. And made an extension of some considerable size in 1932, is that it? Do you have any information on that?

A. Well, I can't give you the precise date, but the line was later extended from El Paso to Douglas, Arizona and from there to Tucson and from there to Phoenix.

Q. You don't have the date of that?

A. I don't have that.

Q. That increased its business considerably, did it not, Mr. Knapp?

A. Well, the indication I have is that the deliveries in cubic feet began to show a marked increase in 1934.

Q. Since that time—since 1935, at any rate, the earnings have been fairly steady and substantial for that company, haven't they?

A. I would say probably from 1937 that condition has obtained.

Q. And having established their load, you have no indication there that there will be any change in that result?

A. No, sir, I have no indication of that. Here again we have a company whose record in the past has not been very favorable and which now is beginning to reach a favorable status.

Q. Well, that, of course, is true with a great many long distance pipe lines, is it not, Mr. Knapp? You don't mean by that, do you, that you attribute the same result from that fact as if an electric company that has been in business for 50 years in a community had shown poor earnings over the last ten years?

A. No, I attribute it to, more than anything else, the fact that most of the natural gas pipe line companies which have been the most profitable ones have not had common stock outstanding in the hands of the public.

Q. Well, that isn't the thing that causes some of them to have business and some of them not to have business, does it?

A. It isn't the thing that causes them to have business, perhaps, but the fact remains that there are many more companies which have enjoyed a consistent record of favorable earnings which have no common stock in the hands of the public. There is, therefore, no way by which you can appraise the public's attitude toward those particular securities.

Q. That is because, of course, there are none outstanding?

A. That is correct.

Q. And it so happens those pipe lines for that reason, either management or territory or whatever it may be, built their load up a little quicker than others?

A. Well, that is the assumption.

Q. Now, what about the Interstate Natural Gas Company? There has been stock outstanding in the hands of the public since 1926 or '7, hasn't there, on that company?

A. For Interstate, my indications are that that company constructed its 18- to 20-inch pipe line from the Monroe field to Baton Rouge in 1926. I have been unable to find any published earnings record prior to 1933. Beginning with that year, the earnings per share were 35 cents; in 1934, 71 cents; in 1935, $1.16; in 1936, $1.82; 1937, $2.50; 1938, $2.13; 1939, $2.11.

Also with respect to Interstate, the initial dividend on that stock, 25 cents, was paid on December 15, 1930. The next dividend paid June 15, 1931 for 25 cents, and no dividends thereafter until December 15, 1936 when $1.75 was paid; 1937, $2.60; 1938, it dropped down to $1.75, and in 1939 it increased slightly to $2.00, which appears to me to indicate that company's record of earnings has been erratic and its dividend policy has been erratic.

Q. You observed, I suppose, that up to 1936 the company paid off all of its bonded debt?

A. Well, I know that it had none outstanding in 1937.

Q. Well, did you obesrve that that had taken place and its surplus increased from 1926 up to that time by that amount?

A. I am sorry to differ with you, Mr. Dougherty, but surplus does not increase for the purpose of paying off bonds.

Q. But it does by virtue of not paying out dividends?

A. It may by virtue of various things. Funds for paying off bonds could be derived from provisions for reserves for depreciation or depletion.

Q. When you do not pay dividends your surplus will increase more rapidly than if you pay dividends out?

A. Assuming that you have earnings, Mr. Dougherty.

Q. Well, you can't pay dividends out without earnings.

A. You say assuming that you paid no dividends your surplus will increase.

Q. Have you any information on Interstate Natural Gas Company back in 1936 to answer what I have asked you about the surplus?

A. Well, you asked me a moment ago if they had not built up enough surplus to pay off its bond issue and my answer is that they don't pay off bond issues by building up surplus.

Q. You pay off by taking money out of the receipts of the company?

A. That's right.

Q. Do you know whether that was done in that case?

A. I presume it must have done so.

Q. And that would naturally result in some increase in surplus if earnings during that year were so utilized?

A. Well, assuming that we know that the company did have some earnings, it is undoubtedly true that a surplus may have increased. I don't know without having seen the figures of the company.

Q. You don't think that was important to go back and find out beyond 1935 what they paid?

A. I don't think it is absolutely essential. I have read you the earnings record of the company which I think speaks for itself. As to whether they paid off their bonds or did not pay off their bonds, I don't think that affects their situation particularly.

Q. It does with respect to whether they pay dividends or not. You gave some indication of not paying dividends as to that having a bad market effect.

A. Well, I think that an inconsistent, erratic dividend policy does have an unfavorable market effect.

Q. Now, how many years do you have to go back to have a consistent dividend policy?

A. Well, I just don't know what you mean, Mr. Dougherty.

Q. Well, the company has had consistent dividend policy for four or five or six years?

A. I wouldn't say it was exactly consistent.

Q. To be consistent, do you have to pay the same amounts each year?

A. It shouldn't be subject to downward fluctuations, I don't think, in order to make it attractive.

Q. Now, you apply that to all other corporations, gas

same; that when they have some decrease in their annual dividends, why, that has a very deteriorating effect?

A. I think it does on a good many investors.

Q. Is it your idea that for one of these natural gas pipe line companies which has a common stock, that would truly represent an accurate appraisal of purchaser interests, that it should have started paying dividends the first year it was in operation and continue to pay at least the same or more each year thereafter?

A. Well, I can say this: A company, of course, may not be able to pay any dividends for the first year or two of its existence, but regardless of that fact, I think a fixed dividend policy has an effect on investors. Whether a company should or should not do a thing does not matter.

Q. It is true also of them that none of them began to pay dividends for four or five years after they started, isn't that true—these natural gas pipe line companies?

A. I wouldn't—well, with respect to those that I have cited, the dividends were paid not long after the companies were organized.

Q. Well, in any event you have used all the available material that there is and is there any difference in the commencing of dividends and the time of the beginning of the line that dividends were paid by these companies than these other natural gas pipe line companies where common stocks are not held by the public?

A. Read that, please.

(The question referred to was read by the reporter as set forth above.)

The Witness: I just don't understand that question.

By Mr. Dougherty:

Q. Do you know anything about the dividend record of other natural gas pipe line companies where common stocks are not held by the public?

A. Yes.

Q. Take the Panhandle Eastern. You had no common stock out until just recently. When did it first pay dividends on its common stock?

A. The first dividend paid by Panhandle Eastern was a stock dividend of $28.26 per share. That was paid on March 25, 1936.

Q. That line was built when—1931, would you say?

A. Its line from the Amarillo field to Springfield, Illinois, was constructed in 1931.

Q. Now take this company—the Colorado Interstate Gas Company. Do you know when it paid its first dividend on its common stock? Do you know what year it was?

A. Yes, I have that information. The first dividend was paid on preferred stock in 1935, apparently cleaning up an arrearage on preferred stock.

Q. That was about the same thing as the El Paso Natural Gas Company. They cleared up their arrearage by not paying it for a number of years.

A. That is true.

Q. When was the first dividend paid on the common stock of the Colorado Interstate Gas Company?

A. 1936.

Q. And this company was constructed in 1928, so that is a longer period of time between the inception of the company and the payment of the dividend than any of those others?

A. Yes, but let me give you a summary of the rate at which Colorado Interstate and Canadian River were establishing earnings after 1928.

Q. Rate on what?

A. Earnings, utility income related to adjusted book cost of plant less reserve for depreciation and depletion as adjusted, plus working capital.

Q. That is the same figure put in by the Power Commission accountant, isn't it?

A. That is correct.

Q. It is already in the record. They show on their computation about an average of 15 per cent over the entire period.

A. Yes.

Q. You haven't any similar figures for El Paso Natural Gas Company, Mr. Knapp?

A. No, I wouldn't think I would be in a position to furnish the figures on El Paso Natural Gas Company.

Q. You haven't them for the Interstate Natural Gas Company?

A. I haven't similar figures because they are not available.

Q. The similar figures you have for Colorado Interstate

and El Paso Natural Gas Company indicate no preferred dividends were paid by Colorado Interstate until 1935 and no common until 1936. Now, isn't that an erratic dividend policy up to that date?

A. That might have some effect on it; that is, if the preferred and common stocks were outstanding in the hands of the public, but they have been held by holding companies.

Q. It is only with some other companies where earnings ratio has some effect but with Colorado Interstate it has no effect?

A. That is not the way I interpret it at all.

Q. That is what you said, Mr. Knapp, practically. The very thing you say affected the high ratio price of El Paso Natural Gas Company you say now would have no such effect if the stock of Colorado Interstate were outstanding, isn't that just what you said?

A. The situation is entirely different, because El Paso Natural Gas Company's stock has been outstanding all this time. Colorado Interstate's stock has not been outstanding all this time. We haven't had an opportunity to see what effect, if anything, Colorado Interstate has upon the investor's appraisal of these securities.

Q. People would react differently here under the same set of circumstances than they would for the El Paso Natural Gas Company?

A. It would seem to me in view of the earnings record I have pointed out that if that stock of Colorado Interstate Gas Company had been held by the public those dividends would not have been in arrears such a long period of time.

Q. Of course, that is your assumption?

A. It is an assumption, but—

Q. Let's take the Colorado Interstate Gas Company. In the first place, you have accepted their earnings on a certain basis that the company didn't publish?

A. In connection with Colorado Interstate?

Q. In connection with Colorado Interstate.

A. Yes, I have.

Q. That is, they were put in by the Commission's witnesses and were not furnished by the company and not put in by the company's witnesses?

A. That is correct.

Q. Let's take Interstate Natural Gas Company. They

didn't pay a dividend in substantial amount until 1935 or 1936, did they?

A. They paid a dividend of 25 per cent in 1930 and again in 1931.

Q. Well, then, they skipped until 19 what?

A. 1936.

Q. So that they even paid dividends before Colorado Interstate did? You can answer that, Mr. Knapp.

A. I can answer it, Mr. Dougherty, but it has no meaning whatsoever.

Q. That is up to somebody else to decide. You answer my questions and then somebody else will decide whether they will have meaning. We want the facts here.

A. I am trying to—

Q. Isn't it a fact that that company paid dividends sooner after its inception than did the Colorado Interstate Gas Company.

A. It did but that doesn't explain why.

Q. Oh, not to you, I know, but that is a fact. Do you still believe that the failure to pay dividends and to have an erratic dividend policy has an effect upon investor appraisal?

A. I think it has an important effect, but I don't think it is the most important effect.

Q. It wouldn't have any effect on Colorado Interstate Gas Company, although it does have an effect upon the Interstate Natural Gas Company?

A. I don't follow your line of reasoning.

Q. Do you think it has had an effect upon Interstate Natural Gas Company's market price ratio?

A. I can't measure the effect but I think it may have had some effect. I think the earnings feature is the more important of the two.

Q. Of course you have no figures that have been furnished to you by the Power Commission's witnesses as to what their computed earnings on certain estimated bases would be for that company, have you?

A. No, I do not.

Q. You are unable to get any market reaction other than the ones of the stocks you have listed here?

A. That is correct.

(Vol. LXXXIII, pp. 12376-12392.)

NATURAL GAS INDUSTRY IN THE UNITED STATES

NATIONAL REVENUES FROM SALES TO CONSUMERS, GAS SALES TO CONSUMERS (M.C.F.), AND NUMBER OF GAS CUSTOMERS

* Companies formerly distributing manufactured gas but which were distributing natural gas at the beginning of 1936 have been included in the above tabulation for all nine years. The data shown above for 1931 to 1939 are therefore not comparable with data on the natural gas industry previously issued for those years.

** Includes leased property rents.

Source of Data: Annual Statistics of the Natural Gas Industry in 1939, Bulletin No. 41, October, 1940, issued by the American Gas Association.

Source of Data:

Years 1926 to 1934, inclusive-Data compiled by U.S. Bureau of Mines, as represented at page 160 of record of hearing before a Subcommittee of the Committee on Interstate and Foreign Commerce, House of Representatives, 74th Congress, 2nd Session, on H. R. 11662 "To Regulate the Transportation and Sale of Natural Gas in Interstate Commerce and for Other Purposes", April 1936.

Years 1935-1936 - U.S. Bureau of Mines, "Minerals Year Book", 1937 and 1938 editions.

Year 1937 - U.S. Bureau of Mines, "Mineral Market Reports, No. M.M.S. 682", issued December 13, 1938.

Year 1938 - U.S. Bureau of Mines, "Mineral Market Reports, No. M.M.S. 772", issued December 19, 1939.

Year 1939 - U.S. Bureau of Mines, Preprint of Chapter on Natural Gas - "Minerals Year Book", 1940 editions.

(1) Excluding gas used for field operations and manufacture of carbon black. Natural gas used for latter purpose is used in the State in which it is produced.

(2) Excluding amounts transported to Canada and Mexico.

(3) Five states produce over 80 percent of total natural gas. These states, ranked according to volume of gas produced in 1939, are Texas, California, Louisiana, Oklahoma and West Virginia.

29. Net Operating Earnings, After Income and Capital Stock Taxes, of Colorado Interstate Under Its Contracts from the Denver Line, 1928 to 1939, Inclusive, and as Estimated, 1940 to 1947, Inclusive, Applicable to Depreciation, Amortization and a Return on the Original Cost of Its Property, Plus Working Capital.

The company's Exhibit 170 (Vol. XLVIII, p. 6598), as amended by Exhibit 170-B (Vol. C, p. 15460), both presented by witness Lusk, bring together the following data for the purpose of presenting the facts set forth in the caption.

The original cost of the company's portion of the Denver Line as shown in Exhibits 67 and 133. These exhibits, as well as exhibits 65, 75, 139, 195, and 196, are all abstracted under Title 18 supra.

The cost of contracts as shown by Exhibit 77. This exhibit and Exhibits 16, 7-E, 7-H, and 7-I are all abstracted under Title 19 supra.

Necessary working capital as shown by Exhibit 70. This exhibit and Exhibit 145 are abstracted supra under Title 22.

Revenues from the sale of gas from the Denver Line as shown by Exhibits 56, 43 and 59. These exhibits, as well as Exhibits 60, 63, 72 and 293, are abstracted under Title 15 supra.

Operating expenses and operating taxes as shown by Exhibits 76, 135 and 135-A. These exhibits and Exhibits 140, 173, 196 and 293 are abstracted under Title 23 supra.

Cost at contract price for gas delivered to Colorado Interstate at Clayton Junction for the Denver Line as shown by Exhibit 164 abstracted under Title 25 supra.

In this Exhibit 170, as amended by Exhibit 170-B, Lusk records for the past and computes for the future all state and Federal income capital stock and like taxes hereinafter abstracted.

After giving effect to all the foregoing data and factors, Exhibits 170 and 170-B show net operating earnings remain-

ing for depreciation and amortization after first deducting amounts necessary for return. These results are set forth in Statement 1 of Exhibit 170, as amended by Exhibit 170-B, as follows:

Colorado Interstate Gas Company

Total for Period		$79,873,614	$43,857,459	$36,016,155	$22,166,509	$13,849,646

Note: (A) 7 Months.

The "original cost rate base" at January 1 for each of the years shown in Column 1 is comprised of the original cost of the physical properties, plus the original cost of the contracts, plus necessary working capital. The "operating costs and all taxes" include the cost of gas abstracted under Title 25, the operating expenses and operating taxes, abstracted under Title 23 supra, plus state and Federal income and capital stock and like taxes next mentioned.

As already stated, Exhibit 170 was corrected by Exhibit 170-B to cure an error in computation of excess profits taxes as estimated for the years 1940 to 1947 inclusive. Statement 1 set forth above shows the corrected figures for those years. The tax computations were originally made before copy of the 1940 Revenue Act and Regulations thereunder had been received. When Lusk received them, he found that they permitted a deduction of normal tax accrued for any one year before computation of the excess profits tax. Thereupon he recalculated the excess profits taxes for the years 1940 to 1947 inclusive, and they are shown in the statement set forth above (Vol. C, p. 15460, et seq.)

The capital stock and state and Federal income and related taxes (which, together with the cost of gas, and operating costs and operating taxes are totaled in Column 3) are set forth in Statement 5 of Exhibit 170, as amended by Statement 5 of Exhibit 170-B, as follows:

Colorado Interstate Gas Company

Capital Stock Tax and Income Taxes on Earnings from Denver Line Sales of All Gas 1928 to 1947, Inclusive

Year	Capital Stock Tax	Federal Income Taxes					Colorado State Income Tax	Total Capital Stock and Income Taxes
		Normal	Declared Value Excess Profits	Undistributed Profits	Excess Profits Tax	Total Federal Taxes

1947	31,900	547,142			173,170	752,212	29,072	781,284

Note: (A) 7 months

On cross-examination with respect to these exhibits, Lusk stated that there were involved two Federal Excess Profits Taxes: First, the "declared value excess profits tax," which was complementary to the Federal Capital Stock Tax, both of which had been in effect for many years; and second, the new excess profits tax imposed on corporations by the Second Revenue Act of 1940. He stated that under the Federal statute the capital stock tax and the declared value excess profits tax were so designed that the company was allowed to declare a capital stock tax base or value in any amount it chose. It then paid a capital stock tax at a rate of $1.10 per $1,000, of declared value (originally $1 per $1,000). Percentages of this same "declared value" are then subtracted from the net income to determine the taxable "declared value excess profits" and such excess profits are taxed at the rate set forth in the Act. He stated that it was to the advantage of the company to declare a value (and pay a capital stock tax thereon at the rate of $1.10 per $1,000) high enough to avoid a declared value excess profits tax at much higher rates (Vol. XLVIII, pp. 6623-26). Explaining how these two taxes were related and how it was more economical to pay the capital stock tax and avoid excess profits tax, he said:

> "To take the year 1940, the declared value, instead of being $19,000,000, assume it was $10,000,000. Our income for that year was $1,500,000. We would immediately fall into the declared value excess profits tax because our income was $1,500,000, and ten per cent of our declared value of $10,000,000 would be only $1,000,000. We would immediately have to pay an excess profits tax on $500,000, so it is much more economical to increase the capital stock base than it is to fall into the surtax values." (p. 6626).

He then pointed out that because the company had neglected to declare a sufficiently large capital base or value in 1935 it was penalized with a large excess profits tax, stating:

> "I might add in that connection that the company in 1935 fell into the error of being forced to pay a declared excess profits tax of $18,000 and they aren't going to let that happen again.

"The Trial Examiner. That is what that lone item out there stands for?

"The Witness: Yes, sir." (p. 6627).

He then explained the operation of the new additional excess profits tax imposed by the Second Revenue Act of 1940 and which, for the purpose of his computation, he assumed would continue in effect without increase, as he did with the other tax rates for the purpose of his exhibits. He explained how excess profits taxes were assessed in addition to normal taxes and as an example took 1940, as follows:

"Well, now, how did you arrive at your estimate, say, for the year 1940, of the figure $712,592, Column 4, Statement 4 of your exhibit?

"A. If we take the estimated revenue less the estimated operating expense and less the actual interest to be paid on the bonds of Colorado Interstate Gas Company, and after deducting depreciation, allowed under the Internal Revenue Department's rulings, we will arrive at a figure which produces the 24 per cent normal income tax of $443,114.

"Now, in addition to that under the 1940 Internal Revenue Act that $443,114 represents the tax on the amount of net income which is in excess of the average for 1936, 1937, 1938 and 1939. That excess under the 1940 Revenue Act produces an excess profit tax of $226,591.

"Q. You proceed from that point, that is, from 1940 through 1947, in making these estimates in Column 5, Statement 5, on the assumption that the 1940 Revenue Act, of course, will remain the same and the same provision will apply?

"A. That is the only assumption we can make." (pp. 6619-20).

This example of the computation employed the figures for the year 1940 of Statement 5 of Exhibit 170 before they were amended, by Statement 5, Exhibit 170-B, but the principle and the method are the same. The figures shown for Colorado income tax under the state law which became effective in 1937 were in the amounts actually paid for 1937

(fractional year) and for 1938 and 1939 and are estimated for the years 1940 to 1947 inclusive on the assumption that the same rates will obtain (pp. 6620-21).

The new excess profits tax was calculated as the act permits on the basis of the "average income method"; that is, the average for 1936, 1937, 1938 and 1939 (Statement 5, Exhibit 170-B). He explained that the terms "normal tax" and "excess profits tax" were used as those terms were defined in the income tax laws p. 6621).

The Commission's accountant Early in his Exhibit 140 suspended all state and Federal income taxes pending determination by the Commission of what he called "a fair return," stating:

> "The Examiner recommends that expenses chargeable to the ratepayers include, with respect to income tax, only such an amount as would represent the necessary taxes required to be paid, based upon the income which the Commission determines it is proper for the company to earn." (Exhibit 140, p. 11; Vol. XXXV, p. 4877). 4877).

By his Entry 142, Exhibit 140, this same accountant Early removed from the expense account for 1937 $944.67 excess profits tax paid for that year. He stated:

> "Excess profits taxes are not regarded as a necessary cost of conducting gas operations and are therefore not includible in expenses which are to be borne by gas consumers."

By his Entry 143 this same accountant removed from operating expenses $17,707 for 1937; $22,184 for 1938; and $22,693.50 for 1939 representing a portion of the capital stock taxes paid. He stated:

> "Since excess profits taxes are not a necessary cost of conducting gas operations, capital stock taxes paid to avoid payment of excess profits taxes are likewise not properly includible in the cost of gas operations."

He had not determined whether the company might have paid "excessive ad valorem taxes" which ought to be disallowed on the same principle (Vol. XXXV, p. 4878). He

admitted that whether an excess profits tax was paid had no reference either to the original cost of the property or any valuation of the property.

"Q. Now, the determination of that unreasonable rate, if there was one, is not made in the same manner as the determination whether excess profits taxes would be under that Federal law. You don't compute them the same way?

"A. That is correct.

"Q. So that don't you believe that there is a difference in your interpretation of what excess profits taxes as levied by the Federal law are in its relationship to a rate case of charges which ought to be charged against the rate payers?

"A. I do not even recall or do not know enough about the excess profits tax law to recall exactly how that item is computed.

* * * * * * * * *

"Q. * * * You have already said that, and you have just said that you are not very familiar with the excess profits law; so maybe wasn't it the phrase 'excess profits' that caught your eye, and you just assumed that possibly that would carry over?

* * * * * * * * * *

"The Witness: I perhaps should not have said that I knew that the methods of computing the taxes were different." (Vol. XLVI, pp. 6403-04).

As to the capital stock tax, although it was based upon purely voluntary declaration of value, he eliminated a portion of the tax corresponding to a portion of the value eliminated and which he himself had allocated to the cost of contracts (pp. 6405-06). He would allow capital stock tax only on a declared value corresponding to "stock issued for a cash consideration" or its equivalent (p. 6405).

On cross-examination Lusk was asked to furnish a reconciliation between the total net earnings of the company and the taxable income shown in these exhibits for each of the years 1928 to 1947 inclusive, which he did in Exhibit 170-A.

In conclusion with respect to these exhibits, Lusk pointed

ut that the cumulative total through 1947 of balance net arnings "available for depreciation and amortization" as hown in Column 6, to-wit, the total $13,849,646, would fall ónsiderably short of amortizing and depreciating the com- any's total accumulated investment through that same eriod, or original cost rate based up through 1947 in the otal amount of $15,151,812. The deficiency will be $1,302,- 66; that is, $15,151,812 less $13,849,646. (Exhibit 170, p. 2, s amended Exhibit 170-B, Statement 1).

The deficiency in that amount is arrived at on the follow- ng assumptions:

First, that the present prices or rates for gas will continue and that the revenues of the company will hold up as shown in Exhibits 56 and 43 as abstracted under Title 15 supra.

Second, that the cost of gas shown by Exhibit 164, as abstracted under Title 25 supra, will remain the same.

Third, that other operating expenses and operating taxes as shown by Exhibits 76, 135 and 135-A, as abstracted under Title 23 supra, will not increase over the estimates therein made.

Fourth, that the Federal and state income taxes and capital stock taxes based on present laws (1940) and as abstracted and computed herein, will not be increased

(Vol. XLVIII, p. 6620).

EXPENSES SUSPENDED FOR FURTHER CONSIDERATION BY THE COMMISSION
FOR THE YEARS 1937, 1938 AND 1939

Line No.	Income Statement Suspension No.	Particulars	Year Ended December 31, 1939	1938	1937
		(1)	(2)	(3)	(4)	(5)
	C (Cont'd)	In view of the statements made by Mr. Lerch and the relative smallness of the amounts involved, it is recommended that the charges identified by the suspension be allowed as necessary and legitimate expenses and therefore included in the cost of conducting gas operations. Suspension has been made by the Examiner primarily in order that the Commission might have before it in this suspension and in Suspension B a summarization of service charges made by associated companies to the Respondent and included in its operating expenses.			
9	D	Federal income tax	$ 391,526.13	$ 309,837.61	$ 335,064.29
		Income taxes for the years 1937, 1938 and 1939, as adjusted, have been suspended for further study and consideration by the Commission and its staff for the reason that the income received by the Respondent, and which constituted the basis for the assessment of its income taxes, may, as a result of this proceeding, be found to have been in excess of a fair return. The Examiner recommends that expenses chargeable to the ratepayers include, with respect to income taxes, only such an amount as would represent the necessary taxes required to be paid based upon the income which the Commission determines it is proper for the Company to earn.			
10	E	Colorado income tax.	$ 27,514.12	$ 18,262.11	$ 8,407.57
		The comments above under Suspension D also pertain to Suspension E			
11	F	Items charged to expense claimed as cost of gas plant in report of Ford, Bacon & Davis, Inc., dated April 15, 1940	$ 44,383.75	$ 50,158.76	$ 55,691.00
		Certain expenses for the years 1937, 1938 and 1939, now claimed by the Respondent as gas plant capital expenditures, have been suspended in order that the expenses so claimed may be identified for the attention of the Commission and its staff. The report of Ford, Bacon & Davis, Inc. covering the claim for restatement of plant has been filed with the Commission by the Respondent. A reconciliation of the amounts shown in the report of Ford, Bacon & Davis, Inc. for the years 1937, 1938 and 1939 with the amounts of this suspension is as follows:			

	1939	1938	1937
Per Ford, Bacon & Davis, Inc. report	$44,622.63	$52,051.24	$56,777.13
Portion of work order 270 (making profile map) claimed as gas plant, expended in the year 1937, and closed to expense in the year 1938 (The entire amount charged to this work order in the year 1937 is transferred to 1937 operating expenses in Examiner's entry R-151)		(559.21)	559.21
Less, interest during construction claimed as gas plant, not included in this suspension	(238.88)	(1,333.27)	(1,645.34)
Per this suspension	$44,383.75	$50,158.76	$55,691.00

Exhibit No. 14C

2125

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S RECLASSIFYING AND ADJUSTING ENTRIES
RELATING TO THE INCOME ACCOUNT

56

Particulars	Year to Which Applicable	Debit	Credit
No. 142			
Miscellaneous income deductions	1937	$ 944.67	
Taxes - Federal income and excess-profits taxes	1937		$ 944.67

To transfer Federal excess-profits tax paid for the year 1937 to miscellaneous income deductions. Excess-profits taxes are not regarded as a necessary cost of conducting gas operations and are therefore not includible in expenses which are to be borne by gas consumers.

COLORADO INTERSTATE GAS COMPANY
EXAMINER'S RECLASSIFYING AND ADJUSTING ENTRIES
RELATING TO THE INCOME ACCOUNT

57

Particulars	Year to Which Applicable	Debit	Credit
No. 143			
Miscellaneous income deductions	1939	$ 22,693.50	
do.	1938	22,184.00	
do.	1937	17,707.00	
Taxes - Federal capital stock tax	1939		$ 22,693.50
do.	1938		22,184.00
do.	1937		17,707.00

To transfer to miscellaneous income deductions the portion of Federal capital stock tax for 1937, 1938 and 1939 not properly includible in gas expenses, computed as follows:

	1939	1938	1937
Capital stock account per books	$4,352,941.17	$4,352,941.17	$4,352,941.17
Deduct: Amount credited to capital stock representing value placed upon contracts to buy and sell gas (See also Examiner's entry No. 224 re plant account)	2,352,941.17	2,352,941.17	2,352,941.17
Balance (represents stock issued for cash consideration	$2,000,000.00	$2,000,000.00	$2,000,000.00
Surplus, per books, at beginning of each year	2,495,890.30	2,366,937.89	2,609,196.84
Total adjusted base for Federal capital stock tax purposes	$4,495,890.30	$4,366,937.89	$4,609,196.84
Tax at $1.00 per each full $1,000.00	$ 4,495.00	$ 4,366.00	$ 4,609.00
Tax per Respondent's books	27,188.50	26,550.00	22,316.00
Excess transferred to miscellaneous income deductions	$22,693.50	$ 22,184.00	$ 17,707.00

Further Testimony of the Company's WITNESS, LUSK.

Q. Mr. Lusk, the figures in Column 5, Statement 5, Exhibit 170, are the ones that are corrected in your Exhibit 170-B, Statement 5, Column 5?

A. Yes, sir, that is the only change.

Q. And the figures in Column 5, Exhibit 170-B, are computed on the basis of the present act as well as the latest regulations of the Treasury Department?

A. No, the last two years—the last amendment was not considered in this.

Q. It was not?

A. No, sir. That is the amendment that states where the last two years are higher than the first two years the last two years can be used as a basis for computing excess profits.

Q. Do you have Exhibit 285 there before you, Mr. Lusk?

A. Yes, sir.

Q. Turn to Statement 5 of that exhibit, Column 3 of your Exhibit 170-B. Why does the normal tax differ in each one of those, one from the other, in those two exhibits?

A. Well, on Exhibit 285 everything is computed on an 8 per cent return, and on Exhibit 170-B in connection with Exhibit 170, that is computed on an estimated annual revenue derived on a sales basis.

Q. I see, and based on the presently existing contracts?

A. That's right.

Q. So that would indicate a present earning in excess of 8 per cent?

A. That is on Colorado Interstate.

Q. Yes.

A. Exhibit 285 does bring that out on Statement 1.

Q. That's right.

A. Yes.

Mr. Lange: That's all.

Redirect Examination.

By Mr. Dougherty:

Q. Mr. Lusk, you also have a different cost of gas to Colorado Interstate Gas Company in the statements which are the basis of 170 as compared with the cost of gas in 285?

A. That's correct.

Q. So you would have to have a completely different computation in each exhibit?

A. That's right. The cost of gas changes with the 8 per cent return.

(Vol. C, pp. 15462-15464.)

Q. Now, you have included it, as I take it, in what you term original cost rate base, first of all the original cost. Now, what do you define under original cost, Column 2, Statement 2 of the exhibit?

A. That is the original cost to the Colorado Interstate Gas Company as indicated in Exhibit No. 67 and Exhibit 133.

Q. Those figures in Column 2, are they per book cost?

A. They are as per books with certain adjustments.

Q. Which adjustments are all reflected in Exhibit 67 and Exhibit 133?

A. Yes, sir.

Q. And those adjustments—strike that.

The original cost as set up by you, Column 2, Statement 2, that also carries forward again the reclassification of certain items that we have discussed heretofore in connection with those exhibits?

A. That is correct, and as a contra to that over in the operating expenses on Statement 4, Exhibit 135, and a contra deduction has been made for those items against expense.

Q. Against expense?

A. Yes, sir.

Q. Now, then, the second element that you have gone into is what you term the original cost rate base as set up in Column 3, Statement 2. That is the cost of gas contracts?

A. That is correct.

Q. Under what theory do you include that in your rate base?

A. My theory is that the Colorado Interstate Gas Company is entitled to include cost of gas contracts in its rate base and earn a return on the cost of those contracts.

Q. For that reason you have included them in your Statement 2 as an element in that original cost rate base?
A. Yes.

(Vol. XLVIII, pp. 6609-6610.)

Further Testimony of the Commission's WITNESS, EARLY.

Q. Mr. Early, if you will please turn to your Adjustments 142 and 143 on Pages 56 and 57—
A. Yes, sir.
Q. What is your authority for your statement that excess profits taxes are not regarded as necessary cost of conducting gas operations?
A. That is my opinion.
Q. You understand, I assume, that the determination of excess profits taxes in 1937, as well as in 1938 and 1939, are not made on the basis of the original cost of the property or any valuation of the property and the net earnings being earned therefrom?
A. Just a moment. There were no excess profits taxes except in the year 1937.
Q. Well, I'll limit it to that. What I had in mind is this, that the determination of whether an excess profits tax was to be paid in 1937 had no reference to either the original cost of the property or any valuation of the property?
A. According to my knowledge of the tax law, that is correct.
Q. So that it is not computed in the same way as the determination of either expenses—not expenses—is not computed in the same way as the question of revenues or profits made from utility operations and the determination of whether those are in excess of a reasonable rate?
A. I don't understand that question.
Q. Well, you have a different basis? You speak in your testimony here and in your exhibit a number of times about if the rates were higher than they should be and therefore more money was made than would be justified on reasonable rates—you mention that in different times in your report.
A. That is correct.
Q. Now, the determination of that unreasonable rate,

if there was one, is not made in the same manner as the same manner as the determination whether excess profits taxes would be under that Federal law. You don't compute them the same way?

A. That is correct.

Q. So that don't you believe that there is a difference in your interpretation of what excess profits taxes as levied by the Federal law are in its relationship to a rate case of charges which ought to be charged against the rate payers?

A. I do not even recall or do not know enough about the excess profits tax law to recall exactly how that item is computed.

Q. Well, you said it was your own opinion that these taxes ought not to be charged against the rate payers. What are your reasons for that?

A. My reason for that is that if the company earns a profit which is large enough to be taxed with excess profits taxes, it might follow that they are also—well, it might follow that chart excess profit is more than a reasonable rate of return.

Q. Of course, you do recognize the fact that the methods of computing both are different? You have already said that, and you have just said that you are not very familiar with the excess profits law; so maybe wasn't it the phrase "excess profits" that caught your eye, and you just assumed that possibly that would carry over?

A. Read that, please.

(The question referred to was read by the reporter as set forth above.)

The Witness: I perhaps should not have said I knew that the methods of computing the taxes were different.

By Mr. Dougherty:

Q. Do you know that they are the same?

A. No.

Q. Do you know anything about it?

A. No.

Q. Now, then, let's turn to 143 which is on Page 57. I note in your computation of the tax base upon which capital stock taxes are paid you have included surplus for each year, 1937, 1938 and 1939.

A. That is correct.

Q. Now, I observe, however, that that is not surplus which has been established by you in this exhibit on the basis of what adjustments you have made and also on the basis of revisions of depreciation and amortization.

A. That is correct. The surplus figure, as I state here, is as per books.

Q. Now, I note, however, that you did deduct $2,352,941.17 which is per books because that had been adjusted by Mr. Schutte.

A. That is correct.

Q. Well, why don't you treat both of them the same way? If you are going to build up surplus for some purposes, why isn't it good for all purposes?

A. I believe that the two cases aren't identical. The elimination of the capital stock representing the capitalization of the contract to buy and sell gas is in my opinion an elimination that is required or is necessary to bring the capital stock account down to that which represents stock issued for a cash consideration, or in other cases for any consideration. The adjustments increasing the surplus account, however, as I have previously stated, I do not know whether they would be reflected on the company's books or not.

Q. Well, you don't know whether the adjustment that Mr. Schutte made is going to be reflected on the company's books either, do you?

A. No, I do not know that it is going to be reflected on the company's books, no.

Q. It looks like you have got a "heads you win, tails we lose" proposition. What I would like to know here is why you don't follow the same rule in both instances. If your adjustment in surplus is good enough for certain purposes in your report, why isn't it good enough for this?

A. It seems to me that if I were to use the adjusted surplus figures here I would be attempting to compute the company's—what the company's—I would be restating the company's surplus in tax accounts from 1937, and that has not been my intention.

Q. Well, you have restated the surplus account of the company right up through 1939.

A. Yes, but I have not meant to imply that that would be reflected on the company's books.

Q. Well, of course, none of this computation that you have made here on Page 57 would ever be reflected on the company's books?

A. Not to my knowledge.

Q. Well, the taxes have been paid?

A. That is correct.

Q. And the thing that you were doing here was determining what you call a total adjusted base for Federal capital stock tax purposes. Now, you recognized, apparently, in determining that phase. Under your theory you add surplus to what you call the corrected capital stock account?

A. That is correct.

Q. Well, don't you have much confidence in the surplus figure which you have boosted up from five million dollars here altogether?

A. I think it is approximately four million dollars—yes, I have confidence in those figures.

Q. But not confidence enough to use it for the purpose of determining what an adjusted base for Federal capital stock purposes is?

A. No, I have attempted to show here the capital stock tax which in my opinion the company should have—or, rather, would have paid had not there been included there in the capitalization of franchises and contracts, and also had not the ta been based upon a declared value far in excess of the book value.

Q. Yes, but what you have here is a tax base which takes the capital stock account by the books and subtracts a deduction which reflects an adjustment made by Mr. Schutte and which you have said should have been made but doesn't accept and doesn't include any addition to surplus which has been and is included in your report. That is exactly what has been done?

A. That is exactly correct.

Q. Now, in your report, altogether, in every respect it includes all of the gas business of the Colorado Interstate Gas Company. All revenue has been taken in here and all expenses, full income?

A. Correct.

Q. There has been no attempt by you to determine what part of the income of the company comes from the gas that it sells directly to industrial consumers in Colorado in this exhibit?

A. No, I have made no allocation—pardon me, Mr. Dougherty, you say the portion of the revenue or the net income?

Q. Net income.

A. Yes.

Q. What portion of the profits come from that?

A. My answer is correct.

Q. You made no attempt to determine what portion of the profits come from the sale of gas to the Natural Gas Pipeline Company of America?

A. No, sir.

Q. So you don't know whether the excess profits which you say would have resulted here, or at least would have resulted if the tax base had not been declared as it was declared, would result from those items of business?

A. Which items of business?

Q. The business of selling gas directly to industrial consumers and the business of selling gas to the Natural Gas Pipeline Company of America.

A. No, I have made no allocations of net income.

Q. So that if the excess profits came from that other business they wouldn't represent excess charges made to the other customers in Colorado?

A. I am sorry, I do not understand the question, Mr. Dougherty.

Q. Well, probably you have covered the point when you say you have made no allocation, you have just taken it on the broad overall basis.

A. That is correct.

Q. Is there any account other than 507 that you charge to taxes under the Federal Power Commission Code referring to tax expense, particularly Federal income tax or State income tax or capital stock tax or excess profits tax?

A. I might refer you to Page 7 of the System of Accounts, general instruction No. 2, Paragraph F. I'll read that:

"All charges to the accounts prescribed in this system for gas plant, operating revenues and operating expenses

shall be just and reasonable and any payments by a natural gas company in excess of just and reasonable charges shall be included in Account 538, miscellaneous income deductions."

Q. Do you think that the taxing authorities made an unjust and unreasonable charge against us? That is what that refers to.

A. I did not.

Q. Well, that is what that account is that you have read.

A. The computation—I did not determine that it was an unreasonable billing.

Q. That instruction you just read refers to whether or not a payment made by a gas company is unreasonable, not whether or not what it collects is unreasonable. That is, that would mean that if the tax we pay was unreasonable, then we could only charge into gas expense the amount that was reasonable. That applies to every expenditure, doesn't it? If the Colorado Interstate Gas Company pays me a fee that is more than reasonable, under that item the Commission could make them charge such portion as was unreasonable to that item, isn't that correct?

A. My interpretation of that paragraph—it is not official—is that it related to charges in excess of just and reasonable charges to the rate payers.

Q. Well, your idea would be, then, that the difference between a reasonable rate and what is not a reasonable rate would go against miscellaneous income deductions. That would be the result of what you are talking about?

A. You speak of a reasonable rate for what?

Q. Well, for what you are selling the rate payers, whatever it is. What you are doing is trying to interpret out of the language, just and reasonable, which is the amount that would permit you to charge an expense into Account 538 because you would say it is not just and reasonable to the rate payers? Well, that doesn't say "rate payers" here, does it?

A. No, that is not mentioned.

Q. What they are talking about here is whether it, in and of itself, is a just and reasonable charge, isn't that correct?

A. My interpretation is "charges in excess of just and reasonable charges to the rate payer."

Q. That is your own interpolation?
A. Yes, sir.

The Trial Examiner: That is, you mean a tax that results from an unjust and unreasonable charge to the rate payers, is that what you had in mind?

The Witness: Yes, sir.

Mr. Dougherty: That is what he has done. That isn't what the instruction says, which we just developed, with which he agrees.

The Trial Examiner: I gather that that is his interpretation.

Mr. Dougherty: That is his interpretation.

(Vol. XLVI, pp. 6402-6412.)

Further Testimony of the Company's WITNESS, LUSK.

Q. Now, the income and capital stock taxes in Column 4, are they exactly as far as 1939 was concerned?
A. It is an actual computation on all gas of the Denver line.
Q. You mean you allocated this portion of the tax to the Denver line?
A. No, sir, we computed it.
Q. You computed it?
A. Yes.
Q. Well, do these represent portions or represent taxes actually paid through 1929?
A. A portion of them do, yes, sir.
For instance, in 1939 the Colorado Interstate Gas Company for all of its business was assessed an income tax for $392,000. Now, this total Federal income tax applicable to resale gas from the Denver line alone is computed at $312,605.
Q. Well, that is set forth in Column 6, Statement 5, isn't it?
A. That is right.
Q. That isn't as per books?
A. That $312,605 includes the capital stock tax, the normal income tax as well.

Q. What was the total?

A. The total income tax in 1939 was $392,000.

Mr. Dougherty: Mr. Lusk, you used the term "resale gas" in the Denver line in your answer just preceding this question. This exhibit contains all gas from the Denver line?

The Witness: Yes, sir.

In 1939 the Federal income tax of Colorado Interstate Gas Company was $392,000 and the Federal capital tax was $27,188.50.

By Mr. Lange:

Q. How do you arrive at that allocation factor, then?

A. We didn't allocate it. All of these taxes are computed on a strictly income basis.

Q. They are computed on a strictly income basis?

A. Yes.

Q. What are your proper divisions for the year 1938? How did you arrive at that?

A. That is a computed amount. The Federal income tax in 1938 was $309,000; that is, on all profits of Colorado Interstate Gas Company, and the Federal capital stock tax was approximately $25,000. I don't see it in the working sheet here, but I know it was paid.

Q. Has it been computed for each of the preceding years also?

A. Yes, sir, in each of the preceding years and each of the years from 1940 to 1947. All of these taxes have been computed, based strictly on the income basis taken from the income and expense shown in the previous sheets of this exhibit.

Q. Well, now, how did you arrive at your estimate, say, for the year 1940, of the figure $712,592, Column 2, Statement 4 of your exhibit?

A. If we take the estimated revenue less the estimated operating expense and less the actual interest to be paid on the bonds of Colorado Interstate Gas Company, and after deducting depreciation, allowed under the Internal Revenue Department's rulings, we will arrive at a figure which produces the 24 per cent normal income tax of $443,114.

Now, in addition to that under the 1940 Internal Revenue Act that $443,114 represents the tax on the amount of net income which is in excess of the average for 1936, 1937, 1938 and 1939. That excess under the 1940 Revenue Act produces an excess profit tax of $226,591.

Q. You proceed from that point, that is, from 1940 through 1947, in making these estimates in Column 5, Statement 5, on the assumption that the 1940 Revenue Act, of course, will remain the same and the same provision will apply?

A. That is the only assumption we can make.

Mr. Dougherty: At least, that percentage wouldn't be any lower than that?

The Witness: I am quite sure of that.

Mr. Dougherty: You haven't made the assumption it wouldn't be increased?

The Witness: I haven't made that assumption and I haven't made the assumption it wouldn't be lower.

By Mr. Lange:

Q. You made the assumption that the yardstick in the tax will also remain there?

A. Yes, sir, that is the latest Internal Revenue Act.

Q. In what fashion did you proceed on your Colorado State income tax, Column 7, Statement 5?

A. The Colorado—

Q. First of all, as to 1939, 1938 and 1937, as to those figures, where did they come from?

A. The Colorado State income tax?

Q. Yes.

A. Actual payments.

Q. Actual payments?

A. Yes.

Q. They were not computed figures there?

A. No.

Q. For 1940?

A. From 1940 through to 1947 the computation for Colorado State income tax is based on a relation of the actual payment for 1937, 1938 and 1939 to the net income.

Q. Now, what did you mean by "normal" as you have described it under the Federal income tax in Column 2, Statement 5 of the exhibit?

A. That is the normal tax as set forth in the Revenue Act in the previous years.

Q. You are using the phrase "as defined." Where do you get the word "normal" itself?

A. In the Act itself in Section 101, Paragraph B.: "Imposition of tax—there shall be levied, collected and paid for each taxable year upon the normal-tax net income of every corporation and the normal-tax net income of which is more than $25,000 * * * "

Q. You have applied the amount as indicated in the Act?

A. Yes, sir, to arrive at the figures in Column 2.

Q. To arrive at the figures in Column 2?

A. That is right.

Q. Statement 5?

A. Statement 5.

Q. Now, how did you arrive at the—strike that.

And those computations for the years 1928 through 1939 are actually obtained on that basis?

A. Yes. We take from 1928 to 1939 and compute all of the tax assessed against the Colorado Interstate Gas Company under the heading of "Normal Tax" purposes so as to distinguish it from the excess value of profits tax and undistributed profits taxes, or any excess surplus accumulation which is another form of tax, and which is not shown here as being paid, but the normal tax itself is taken right from the wording and the definition in the various revenue acts applicable to the years 1928 through 1939.

Mr. Dougherty: You used the percentages that each of those laws had in effect in those years?

The Witness: We used the actual rates.

By Mr. Lange:

Q. When you proceeded beyond 1940, how did you arrive at the estimate under Column 2?

A. Well, in Column 2 we are taking 24 per cent of the net income which is computed, using the statement preceding this as the basis, and using the operating expenses which are also shown in this exhibit.

Q. And you based that on the 1940 tax law?

A. Yes, sir.

Q. Now, what rate did you use for the 1940 estimate?

A. 24 per cent.

Q. And for each of the following years?

A. 24 per cent.

Q. Now, your capital stock in Column 2, is that actually from 1933 to 1939?

A. No, that is also computed?

Q. How?

A. For all gas purposes.

Q. Just how did you go about it? What are the mechanics of that?

A. The mechanics of it are this: I used the company's method of working out on the basis of net income, using a capitalization rate of either ten or 12½ per cent. In other words, the company had $800,000 of income and they capitalized it at 12½ per cent, and I would take it and multiply by eight and that would be all. They had the same thing at ten per cent which they actually did in those years. They assumed a base income and capitalized it at either ten or twelve and one-half per cent and used that as their capital stock declared value.

Q. Under Column 1 the tax for 1939 is $18,500. Under what acts was that computed?

A. That is under the 1935 or 1936 act.

Q. When you arrived at an estimate for 1940, how did you arrive at the $20,900 as listed under that column?

A. That is done in the same manner. The mechanics are exactly the same.

Q. Is there a different rate applicable to make that amount?

A. No, sir, there is no rate on the capital stock tax at all except the capitalization rate. I used 12½ per cent which is the rate the company used for the years 1934, 1935, 1936, 1937, 1938 and 1939.

(Vol. XLVIII, pp. 6617-6624.)

30. Estimated Net Operating Earnings After Income and Capital Stock Taxes of Colorado Interstate from an Assumed Denver Line for Resale Gas Only Under Its Contracts, 1928 to 1947, Inclusive, Applicable to Depreciation and Amortization and a Return on Equivalent Original Cost of Its Property, Plus Working Capital.

Exhibit 172 (Vol. XLIX, p. 6720), as amended by Exhibit 172-A (Vol. C., p. 15465), both presented by the company's witness Lusk in a manner similar to his method employed in the preceding subdivision, bring together the following data for the purpose of presenting the facts set forth in the caption:

The equivalent original cost of "a Denver Line for resale gas only," Exhibit 134 abstracted under Title 20 supra.

The cost of contracts, Exhibit 77. This exhibit and Exhibits 1, 16, 7-H, 7-I, 7-E are abstracted under Title 19 supra.

Adjusted necessary working capital, Exhibit 70 abstracted under Title 22 supra.

Past and estimated future revenues from resale gas only, Exhibits 43 and 56. These exhibits, as well as 59, 60, 63, 72 and 293, are abstracted under Title 15 supra.

Annual operating costs and operating taxes of a "Denver Line for resale gas alone," Exhibit 136 abstracted under Title 24 supra.

Cost at the contract price at Clayton Junction of resale gas only, Exhibit 167 abstracted under Title 26 supra.

The witness, in the Exhibits 172 and 172-A, computed Federal and state income taxes and Federal capital stock and like taxes arising from the sale of resale gas only in the same manner as outlined in the preceding subdivision for all gas. Since his method was the same, we reproduce here only the total of such taxes for the years 1932 to 1947 inclusive, there being no tax prior to 1932 when resale gas alone is considered.

1932	$ 2,840	1940	$283,925
1933	3,200	1941	415,398
1934	3,200	1942	526,327
1935	54,446	1943	557,172
1936	87,696	1944	662,557
1937	132,715	1945	770,633
1938	143,439	1946	769,038
1939	159,193	1947	436,808

(Statement 5, Exhibit 172, as amended by Statement 5, Exhibit 172-A.)

After giving effect to all the foregoing data and factors, Exhibits 172 and 172-A show net operating earnings remaining for depreciation and amortization after first deducting amounts necessary for return. These results are set forth in Statement 1 of Exhibit 172, as amended by Statement 1, Exhibit 172-A, as follows:

Colorado Interstate Gas Company

"A Denver Line for Resale Gas Alone"

Rate Statement Showing Net Operating Earnings Applicable to Depreciation, Amortization and Return, 1928 to 1947 Inclusive

Calendar Year	Original Cost Rate Base at Jan. 1st	Revenues Resale Gas Sales and Rentals	Operating Costs and All Taxes	Net Operating Earnings for Return, Depreciation and Amortization		
				Total Net Earnings	Amount Required for 8% Return	Available for Depreciation and Amortization
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Actual						
1928 (A)	$10,064,790	$ 471,229	$ 274,129	$ 197,100	$ 469,690	$ —272,590
1929	10,297,805	1,552,909	505,823	647,086	823,824	—176,738
1930	10,760,908	2,172,641	1,643,864	528,777	860,873	—332,096

Estimated						
1940	14,130,771	3,212,499	1,951,326	1,261,173	1,130,462	130,711
1941	14,134,771	3,434,113	2,058,869	1,375,244	1,130,782	244,462
1942	14,141,771	3,575,908	2,124,387	1,451,521	1,131,342	320,179
1943	14,373,771	3,703,123	2,223,806	1,479,317	1,149,902	329,415
1944	14,374,771	3,837,599	2,298,783	1,538,816	1,149,982	388,834
1945	14,375,771	3,992,030	2,393,244	1,598,786	1,150,062	448,724
1946	14,376,771	3,992,030	2,447,051	1,544,979	1,150,142	394,837
1947	14,377,771	3,992,030	2,660,023	1,332,007	1,150,221	181,786
Total for Period		$56,615,478	$34,763,219	$21,852,259	$20,552,689	$ 1,299,570

Note: (A) 7 Months.

The original cost rate base at January 1 for each of the years shown in Column 2 is comprised of the "equivalent original cost" of such a Denver Line for resale gas only, plus the original cost of the contracts, plus necessary working capital. The "operating costs and all taxes" shown in Column 4 include the cost of gas abstracted under Title 26 supra, the operating expenses and operating taxes, abstracted under Title 24 supra, plus state and Federal income and capital stock and like taxes, computed as above stated.

The accumulated total of balance net earnings "available for depreciation and amortization" through 1947 is $1,299,570, whereas the total estimated "equivalent original cost" rate base accumulate through that period and which would have to be depreciated or amortized is $14,377,771, resulting in a deficit of $13,078,201.

The deficiency in that amount is arrived at on the following assumptions:

First, that the present prices or rates for gas will continue and that the revenues of the company will hold up as shown in Exhibits 56 and 43 as abstracted under Title 15 supra.

Second, that the cost of gas as shown by Exhibit 167, as abstracted under Title 26 supra, will remain the same.

Third, that other operating expenses and operating taxes, as shown by Exhibit 136, as abstracted under Title 24 supra, will not increase over the estimates therein made.

Fourth, that the Federal and state income taxes and capital stock taxes based on present laws (1940) and as abstracted and computed herein will not be increased

(Vol. XLVIII, p. 6620).

Q. Mr. Lusk, in the preparation of this Exhibit 172, I understand that it confines itself to resale gas alone?

A. That's correct.

Q. And, of course, resale gas alone of Colorado Interstate Gas Company?

A. That is all.

Q. And, of course, in so far as the present actual operation of Colorado Interstate Gas Company and the operations of that company for all the years back, 1939 back to 1928, have in fact included sales both direct as well as resale?

A. That is correct.

Q. As is reflected in your Exhibit 170?

A. That's right. That takes in all gas.

Q. And as far as you know, that is the way that the company proposes to continue its operations as is indicated in your Exhibit 170 when you projected those total sales forward?

A. That is correct.

Q. Through 1947.

A. It is my understanding that the Colorado Interstate Gas Company will continue to sell all types and classifications of gas.

Q. Now, then, as I take it, this Exhibit 172 takes the figures as set forth in your Exhibit 170 and relates the applicable ones to resale gas alone in this Exhibit 172?

A. No, that is not quite correct, Mr. Lange. Exhibit 172 is a distinct compilation of its own.

Q. Of its own?

A. Yes.

Q. And in what respect does it find support in Exhibit 170?

A. The only material taken from Exhibit 170 is working capital for the purposes of this exhibit.

Q. All right, let's go to your Statement 1 of Exhibit 172, Column 1, which is labeled "Original Cost, Rate Base at January 1st."

Mr. Dougherty: Column 2.

Mr. Lange: Column 2.

The Witness: Column 2.

By Mr. Lange:

Q. I requested you yesterday on cross examination to give your definition of what you contemplate under the term "rate base," and I will ask you now whether that same definition applies here.

A. It does, yes.

Q. Now, in constructing this Column 2 which is designated "Original Cost Rate Base at January 1," what statement in your Exhibit 172 provides the support for that?

A. Statement 2 supports Column 2.

Q. And referring, then, to Statement 2 of the exhibit, Column 2, in what manner did you construct the figures under that column?

A. On Statement 2, Column 2, the figures are taken from Exhibit 134 with the exception of the first year, 1928, which is the book balance as of June 1, 1928. All of the other figures are taken from Exhibit 134. Now, Column 1, Statement 1, in Exhibit 170, finds its support in Statement 2 of that exhibit, Column 2.

Q. Yes—no, in Column 1, Exhibit 170.

A. I beg your pardon. That also finds its support, yes, sir, in Statement 2 of the Exhibit 170.

Q. And Statement 2 of your Exhibit 170 gives as the support the following items:

Original cost as of June 1st and cost of gas contracts, average working capital. I see in your Statement 2 of Exhibit 172 you say "equivalent original cost." You make that modification in order to comply with the figures set forth in Exhibit 134, or what?

A. That is the reason for it. I am using the heading and the classifications of Exhibit 134, "Equivalent Original Costs."

Q. Which, of course, means that it isn't the same even in adjusted figures comparable to the book figures?

A. No, the equivalent original costs in Exhibit 134 is the reduced cost of the pipe line from Clayton to Devine, reducing the diameter of the pipe from 22 inches to 20 inches, with the corresponding reductions, if any, in the compressing station.

Q. Now, then, in the next item supporting the original cost rate base in your Exhibit 172, Statement 2, that is cost of contracts. I see that is the same as that appearing in Column 3, Statement 2 of Exhibit 170.

A. That is the same amount, yes, sir.

Q. Now, then—the same amount both for the past as well as the estimated future are the same as that set forth in Exhibit 170?

A. Yes, sir.

Q. I believe I asked you in connection with that column and the items in that column in Exhibit 170 whether or not you had made any allocation as to any other market other than the Denver market and you stated you did not.

A. I did not.

Q. Because the contracts were already in existence prior to the time the Colorado Interstate Gas Company developed or acquired any other market, particularly the Chicago market.

A. That is correct.

Q. Now, then, here in this Exhibit 172 you are still not allocating, although isn't it very definitely set forth in that contract of January 3, 1928, that direct sales are a part of that contract, and naming those direct sales?

A. The direct sales are a part of that contract, yes, sir.

Q. Then, why should not a part of this cost of gas contracts be allocated to direct sales?

A. I had no basis in which to allocate them and I had no basis in which to separate the first contract.

Q. You had no basis?

A. I had no basis for making any allocation.

Q. Well, then, I will ask you, as an accountant in the light of your knowledge of the facts and in the light of your knowledge of the total volumes of gas that is attributable to direct sales during all of these years, whether it wouldn't have been proper to make an allocation of part of that cost for gas contracts to direct sales?

A. I wouldn't do that for the simple reason that the volume basis is not a sound basis.

Q. Is not a sound basis?

A. No, sir.

Q. Then, it is your position that the direct sales should not bear any part of that at all?

A. No, I am not of that opinion. As far as the separation of this cost of gas contracts is concerned, that is one of my immediate problems and I hope to solve it very soon.

Mr. Dougherty: Well, Mr. Lusk, this complete statement here is not based on allocation, is it?

The Witness: None of this is based on allocation.

Mr. Dougherty: That is, this 10-inch line project is not an allocation?

The Witness: That is not an allocation.

By Mr. Lange:

Q. You take the position in Exhibit 170 which covers all of the gas, both direct and resale gas, that cost of gas contracts is an item directly includable in the rate base, as you term it, for those entire sales?

A. That is true, yes, sir.

Q. Now, you attempt or make a separation that you would set up applicable to resale gas alone which is a part of the total sales contemplated and considered in your Exhibit 170?

A. That is correct.

Q. And a very substantial part of that gas that enters into the consideration in 170 is excluded from your Exhibit 172?

A. That is right.

Q. Well, then, as an accounting matter, shouldn't a part of that cost attributable to direct sales be allocated to those direct sales and not the entire amount attributable to these resale items alone?

A. Well, I think I stated, Mr. Lange, that the first part of this cost of gas contracts, $2,000,000, was an amount represented by the stock issued to the Southwestern Development Company as nominee for the Canadian River Gas Company. I think I stated in my testimony that I don't dispute that there may be some part of that contract applicable to the direct sale gas, but that when I made this exhibit up I had no basis for separating it, and that is one of my immediate problems.

Q. Then, why couldn't you then, in light of the fact that that knowledge was absent and you didn't have it, why couldn't that entire amount, then, under Column 3, Statement 2 of Exhibit 172 be attributable to and charged to the direct sales?

A. Well, by making up a direct sale gas exhibit on the same basis as this, then I would still have the problem of separating the two million dollars gas contract costs.

Q. In other words, if you were preparing such a direct sales statement and still did not have any more informa-

tion with reference to how to allocate than you have now, you could very well have set up that whole cost to direct sales as well as you did to the resales here?

A. No, I wouldn't set up the entire cost because everything over and above two million dollars represents actual resale gas.

Q. No, but I am referring to the costs of gas contracts set forth under Column 3, Statement 2 of Exhibit 172 that you set up in their entirety in this resale exhibit in the same amounts as they have appeared in your Exhibit 170 covering all sales.

A. No, I wouldn't set that up for direct sales. As I mentioned—

Q. Why?

A. Everything over and above two million dollars is strictly resale gas.

Q. Well, then, what would you set up in such a statement of direct sales?

A. I am not prepared to state. I still repeat that I still have the problem of separating that two million dollars.

Q. And you haven't reached any conclusion on that?

A. No, sir.

Q. Well, then, if you would follow the same course of reasoning in connection with the preparation of that direct sale statement computation, why couldn't you have put at least two million dollars of that Column 3 item into that computation on direct sales?

A. That wouldn't be fair either.

Q. Why?

A. Because the direct sales are under the terms of the contract, the direct sales and resales are together.

Q. That's right, but what I am concerned about is your putting that entire amount in this resale computation in Column 3 of Statement 2 when it is definitely not only apparent but definitely assignable in the contract that direct sale customers named or in that contract of January 3, 1928, were contemplated at that time.

A. That is correct. They were both contemplated and both classes of customers contemplated in that contract—resale and direct sale.

Q. So that at this time in the absence of having made

any study, further study as to how to treat at least a portion of that cost of gas contracts, you say as an accountant that the items appearing in Column 3, Statement 2 of Exhibit 172 are in excess of what they ought to be for resale gas alone?

A. They are to the extent that I have not made any separation between the two million dollars cost of gas contract between direct sale and resale and I still have to work that problem out.

Q. And you aren't prepared to say as to what would be the fair amount that should be attributable to resale in so far as that particular item in Column 3 is concerned?

A. No, sir, I am not prepared.

Q. Now, you say that that is still a problem which you at this time have got to solve. What are your thoughts—what basis are you expecting to use to arrive at a solution of that?

A. That is the problem.

Q. That is the problem. Now, your average working capital, that is a computed figure in Column 4, Statement 2 of Exhibit 172, isn't it?

A. Yes, sir, it is. It is taken from Exhibit 170 and then computed on the basis of the operation expense ratio between all gas and resale gas.

Q. Now, what is your definition of "average working capital" as you have used it?

A. Well, this average working capital that I have used here and that we have used practically all through our exhibits, is a compilation of the operating expense, materials and supplies on hand, cash in local banks, all added together and divided by eight on a 45-day working basis.

Q. Oh, you utilize a 45-day working basis?

A. Yes, sir, and the basis of all of these computations of working capital throughout all of our exhibits is based on a 3- and 5-year average, and not confined to any one year.

Q. Just how would you as an accountant determine the proportionate part of the average working capital that could be allocated directly to resale gas by this company in the light of the fact that during the 3- or 5-year period that you used as support, the company in fact sold both resale and direct?

A. That is correct.

Q. I say, then, how did you go about making your estimate on a resale basis alone in the light of that history?

A. Well, it is just as I explained in the text in here and I think I can explain it again, that the average working capital determined for resale gas alone was based on the working capital contained in Exhibit 170 and the factors were derived by taking the ratios of the operating expenses between resale and all gas. Those operating expenses being the subject of previous exhibits.

Q. And when you are speaking of taking into consideration the company's actual experience over a period of years past, of course, that actual experience of the company was had in connection with their total sales which includes both resale as well as direct sales?

A. That is correct and that is what Exhibit 170—

Q. So in so far as that particular phase of it is concerned, you did predicate your working capital calculations on Exhibit 170?

A. That is correct, yes, sir.

Q. Right at that point, I don't know whether I asked you heretofore whether or not you had ever made any estimates or constructed any skeleton statement which had reference to direct sales of gas alone similar to this Exhibit 170?

A. No, sir.

Q. You did not?

A. No, sir.

Q. You don't know what those results would show?

A. I haven't tried it. I haven't attempted to.

(Vol. XLIX, pp. 6726-6737.)

31. Cost of Gas to Colorado Interstate at Clayton Junction as Computed by the Company for the Denver Line Determined on a Regulatory Basis and Under the Assumption That the Supply of and Markets for the Gas Continue Beyond 1948, the End of the Project Term, and Until the End of 1956.

These costs are shown in Exhibit 276. This exhibit and the testimony relating thereto is covered more fully by Canadian and is adopted by Colorado Interstate. The costs there shown are for the years 1939 to 1947 inclusive and are as follows (Statement 1):

Year	Production	Gathering	Transmission	Total
(1)	(2)	(3)	(4)	(5)
1939	$ 643,088	$ 129,199	$ 567,573	$1,339,860
1940	708,450	140,421	685,882	1,534,753
1941	734,493	146,270	710,724	1,591,487
1942	690,315	140,954	711,376	1,542,645
1943	680,726	142,170	784,333	1,607,229
1944	679,422	142,117	815,078	1,636,617
1945	674,970	144,344	843,626	1,662,940
1946	767,455	170,879	875,390	1,813,724
1947	1,399,104	370,245	914,542	2,683,891

As stated in the caption, the cost of gas in this exhibit is computed on the assumption that the supply of and market for gas will extend beyond the project term, that is, beyond 1948. In the cost, there is included amortization and depreciation spread through, so to speak, to the end of 1956. Such year was used for this purpose because other witnesses for the company estimated that the economic life of the field would cease by the end of 1956. The cost above stated accordingly reflects annual depreciation and amortization charges based on a life extending through 1956, however, the total cost of gas is estimated for the purpose of this case only through 1947.

32. Cost of Gas to Colorado Interstate at Clayton Junction as Computed by the Company for an Assumed Denver Line for Resale Gas Only Determined on a Regulatory Basis and Under the Assumption That the Supply of and Markets for the Gas Continue Beyond 1948, the End of the Project Term, and Until the End of 1956.

These costs are shown in Colorado Interstate's Exhibit 277. This exhibit and the testimony relating thereto is included by Canadian hereinafter and is adopted by Colorado Interstate. The costs there shown for the years 1939 to 1947 inclusive are as follows (Statement 1):

Year	Production	Gathering	Transmission	Total
(1)	(2)	(3)	(4)	(5)
1939	$ 399,115	$ 85,430	$ 566,534	$1,051,079
1940	461,301	99,940	693,264	1,254,505
1941	485,734	105,900	709,237	1,300,871
1942	454,798	100,578	714,040	1,269,416
1943	453,881	101,618	771,254	1,326,753
1944	456,048	102,175	826,520	1,384,743
1945	457,472	104,682	854,009	1,416,163
1946	536,437	128,653	880,991	1,546,081
1947	1,201,815	378,896	909,202	2,489,913

As stated in the caption, the cost of gas in this exhibit is computed on the assumption that the supply of and market for gas will extend beyond the project term, that is, beyond 1948. In the cost, there is included amortization and depreciation spread through, so to speak, to the end of 1956. Such year was used for this purpose because other witnesses for the company estimated that the economic life of the field would cease by the end of 1956. The cost above stated accordingly reflects annual depreciation and amortization charges based on a life extending through 1956, however, the total cost of gas is estimated for the purpose of this case only through 1947.

Q. What is your purpose in the presentation of this first exhibit No. 276.

A. The purpose is to show cost of gas delivered to the Colorado Interstate Gas Company at Clayton Junction, New Mexico, on the regulatory rate basis as defined.

Q. You proceeded with the discussion of your exhibit on Page 3 where you referred in Paragraph 4 to the fact that the rate base used herein as of January 1, 1939 is the depreciated original cost as of December 31, 1938, shown by Exhibit 272.

A. Exhibits 272 and 273.

Q. Exhibits 272 and 273?

A. Yes.

Q. Those are the exhibits heretofore identified by Mr. Roberts?

A. That is correct.

Q. Now, then, you use the term "depreciated original cost." You are using that phrase in the same fashion as Mr. Roberts employed it; that is, applying the depreciation that is predicated upon per cent condition of the property and then relate it to dollars?

A. That is correct, the depleted and depreciated original cost as of December 31, 1938, as indicated in Mr. Robert's Exhibits 272 and 273.

Q. In employing that phrase in the sentence that Mr. Roberts employed, you of course don't relate that so-called accumulated depreciation to the depreciation that has heretofore been set up on the company's books?

A. No, sir.

Q. You begin with December 31, 1938 and set up, as you say in the next paragraph, Paragraph 5 of your Statement 3, a sinking fund method of depreciating?

A. The sinking fund method or the compound interest method of amortization.

Q. Amortization?

A. Yes, sir.

Q. That is entirely a new departure as far as the company's history is concerned?

A. That is correct. The company has not used the sinking fund method.

Q. Not in any time heretofore?

A. No, sir.

Q. In any of the properties?

A. No, sir.

Q. You are relating that as of the beginning, January 1, 1939, the setting up of the sinking fund?

A. That is correct, yes, sir. The date of it is January 1, 1939, beginning with the observed depreciated and depleted condition.

Q. Heretofore the company had set up a debt amortization plan beginning in 1928, hadn't it?

A. Yes, sir.

Q. And it had set up a depreciation plan in 1931?

A. That is correct.

Q. Had you also set up a different plan for depreciating short-life properties, or how were they treated?

A. They were usually handled on a 25 per cent basis.

Q. How had they been handled before?

A. On a 25 per cent basis.

Q. Now you come to January 1, 1939 and all of those previous methods have definitely been discarded for this new sinking fund plan you have here?

A. For the purpose of this exhibit here, all of the company's methods have been discarded.

Q. As a matter of fact, though, actually, this being presently March 24, 1941, there has been no sinking fund method put into effect by the company?

A. No, sir.

Q. Although this contemplates the setting up of such a plan as of January 1, 1939?

A. That is correct.

Q. Now, this new sinking fund method, that is going to be more or less an all-embracive one excepting for short life property?

A. That is correct.

Q. It supersedes your previous debt amortization plan as well as any other method of acumulating any reserve for those purposes?

A. This is the alternative plan based entirely upon the regulatory or rate basis using the compound interest calculation for amortization.

Q. And going back to that method of computing depre-

ciation as set up on the company's books in 1931, that was set up on a straight line basis?

A. That was a 25 year life, strictly.

Q. And had been so viewed?

A. Yes, sir.

Q. But you are not in accord with the idea of the company depleting its properties on a straight line basis?

A. Oh, yes, for an accounting basis, I think the straight line is all right, but for the purpose of rate making, I think the compound interest method is much better.

Q. You think the compound interest method is much better?

A. Yes, sir.

Q. Are you in accord with the definition of the sinking fund method as Mr. Paton sets it up in his Accountants Handbook where he says: "This method involves the systematic accumulation, in the hands of a trustee or otherwise, of a fund which will amount to the total of the depreciation in any case by the estimated date of retirement, and the interest rate involved, instead of being the estimated earning power of the asset being depreciated, or of the general business assets of the concern involved, is the contractual rate actually secured on the fund."?

A. That is what the premise of this exhibit is.

Q. That is the method you advocate in this exhibit?

A. Yes, sir.

Q. But as you just stated, although it contemplates such a method being set up as of January 1, 1939, it has not in fact been set up by the company as of this time?

A. It has not.

Q. So it is being advocated by you merely for the purpose of this exhibit?

A. Merely for the purpose of this exhibit and for the purpose of this hearing, this proceeding.

Q. As far as you know, the company doesn't in fact contemplate setting up such a sinking fund method on its books?

A. I don't think it does.

Q. How do you define the straight line method of depreciation?

A. The straight line method ordinarily is an estimated life of so many years divided into one, which would give a rate.

Q. And that is the method that the Commission's accountants have presented in this proceeding?

A. Yes, they have used an estimated life, a service life.

Q. What is your objection to the use of that method?

A. My chief objection to the use of that method is it is always a diminishing rate base.

Q. It is always a diminishing rate base?

A. That is correct.

Q. That is not so good, is it?

A. Not to my knowledge—not to my way of thinking, no, sir.

Q. But you would let a plant be in existence eleven years and then just by the process of inspection of its physical properties find a per cent condition and relate that per cent condition to what you would determine accumulated depreciation as of that date and start from there?

A. I think that is quite proper, yes, sir, for rate purposes.

Q. For rate purposes?

A. Yes, sir.

Q. Disregarding that entire 11-year period in so far as the life of the property is concerned?

A. That is correct.

Q. Supposing this rate proceeding, instead of having taken place at this time had not in fact taken place until 1953 or 1954. You would still proceed in the same fashion, setting up the same methods as you have here?

A. That is right.

Q. Even though you also at that time would have the same information available to you as made available by your geologists in this proceeding, namely, that in their opinion from their estimates of the life of the Canadian River Gas producing acreage or its acreage in the Panhandle field would expire or come to an end in 1956?

A. That would be based primarily on what their judgment was or what their calculations resulted in as far as the depletion of the field as a whole was concerned.

Q. Let's assume just for the sake of the problem that at that time that would have been their opinion, or would be their opinion, and 1956 was just ended and this rate proceeding, instead of taking place now would have taken place in 1954. I take it then you would set up a sinking fund method of depreciation and amortization of the properties

that would require the amortization of the entire plant during a period of—well, it might be a year and a half or less than that.

A. Well, the principle would be the same but I doubt very much if the companies would allow themselves to get into a position whereby they only had two remaining years to recoup the value of a property at a given date.

Q. You just now stated that you didn't contemplate having the company set up on its books a sinking fund method of depreciating and amortizing properties but that this was computed and set up merely for the purpose of this exhibit, so they would continue on as they have now until 1954, saying there hadn't been a rate proceeding in the interim?

A. They would continue the same way as they are doing now, and as far as this exhibit is concerned, it would be set up on the same basis, but I doubt very much whether the company would recover it in a two-year period. As a matter of fact, I don't think they could.

Q. They couldn't?

A. I think not.

Q. So they would probably reach 1955 or 1956 and if the property were maintained in the same high level it is now it might still be in 93 per cent condition?

A. That is correct, and the company would in that last two-year period, if the field went out in such a short period of time, be faced with a loss of that property.

Q. They would?

A. Yes, sir.

Q. In your opinion it isn't the proper way to spread your depreciation and amortization over the entire life of the properties ratably from 1928 to the time you say that the field life would come to an end?

A. No, this particular exhibit here, Exhibit No. 272, begins with January 1, 1939, as of that date.

Q. You would proceed in the same fashion whether this proceeding had taken place at any *late* year, starting right from scratch?

A. In dealing with extremes where we have a narrow margin of two years, as you mentioned before, the company would have to sustain the loss.

Q. Suppose you would have this in 1945 instead of now, you would set it up on the same plan?

A. On the same plan.

Q. Having there instead of 4.36—

A. I would get a little higher figure.

Q. You would probably have some higher figure?

A. It would be around 6.

Q. Although from the estimates made, the useful life of these properties would be the period from 1928 to 1956, you wouldn't give any consideration to that period of life of the properties that had gone before but would begin from whatever period there would be a rate proceeding?

A. We would do that in the case—when we started with a depreciated and depleted condition as of December 31, 1938, we did give effect to the loss in service value and the depletion of the field as a whole and we would begin with the depreciated and depleted condition.

Q. But you only pay respect in so far as the depreciated condition of these properties are concerned, in so far as the per cent condition that you may find *them*?

A. That is the observed condition, yes, sir.

Q. And no other factor with reference to the service life has already expired?

A. We considered the factor of depletion; the amount of gas withdrawn.

Q. In so far as the depletion is concerned, you do?

A. Yes, sir.

Q. But that is only related to the leaseholds and the producing gas wells?

A. That is correct.

Q. You will proceed in that fashion with reference to those two items of property but you don't think it is correct to proceed in a similar fashion with respect to the other units of property?

A. No, sir, I don't, because the observed condition is our starting point in practically all of the rate proceedings set up on this particular basis.

Q. You wouldn't think of doing that to try to observe the performance of the gas well at any particular time?

A. I don't think the performance of a gas well; that is, as far as the depleted property is concerned, can be observed.

Q. That is your difficulty there?

A. That is the difficulty of the hole in the ground, the vertical hole, yes, sir.

Q. You have had considerable experience in connection with the operation of properties like those of Canadian River. What in your opinion would have been the condition of the Canadian River's main lines if there hadn't been a high maintenance taking place? If they hadn't been maintained at a pretty high rate of maintenance, what would have been the condition?

A. I don't know just what you mean. Do you mean a high cost of maintenance?

Q. No. What in your opinion would you have found as to the per cent condition of the property as of December 31, 1939 if there had been a lack of maintenance by the company?

A. Ordinarily, maintenance itself tends to keep up the service life of the property. Deferred maintenance has the reverse effect, as far as I know from my experience in the natural gas business.

Q. So if there hadn't been a good maintenance on those lines prior to December 31, 1938, you probably at that time wouldn't have had a 93 per cent condition?

A. Well, I don't know as you can relate the actual per cent condition against a particular form of maintenance. I think, as Mr. Roberts explained, that in many cases during inspection the number of pits were observed and it may have been due to the inspection itself that certain joints of pipe were removed. All of that was taken into consideration as to the per cent of observed condition.

Q. But, Mr. Lusk, if there had been no maintenance at all on these properties, certainly in the light of your experience you wouldn't say that they wouldn't have been in 93 per cent condition, the maintenance would have been in 93 per cent condition as of December 31, 1938?

A. No, and I think Mr. Roberts explained that when he said that it might be in some other per cent condition. They may have found a lower one.

Q. A lower one? It may not have been higher?

A. I beg your pardon, but I was talking about maintenance. It probably would have been lower.

Q. Lower?

A. Yes.

Q. As a matter of fact, that same situation would obtain with other units of property if there should have been an entire lack of maintenance?

A. If there was an entire lack of maintenance, the property would have been in a lower per cent condition.

Q. I believe the company's past history shows that they set up a debt amortization plan right at the beginning of the operations of these properties in 1928, doesn't it?

A. That is right. The mortgage indentures provided for uniform retirement.

Q. That is under the contract?

A. That is under the contract, yes, sir.

Q. As a good accounting matter, why didn't the company at that time set up a plan of amortizing its investment in those properties over the life of the property?

A. They saw fit to amortize the debt rather than the property.

Q. They did?

A. Yes, sir.

Q. In that fashion they would recover their debt much quicker, wouldn't they?

A. The debt is being liquidated under the terms of indenture.

Q. Would it be liquidated much quicker?

A. Yes.

Q. And ratably over a period of years?

A. 20 years.

Q. Under that plan that was set up by them to amortize that debt, they have already been able to recover over that period—it is 13 years now, isn't it? Or is it 12 years?—that portion of the debt?

A. The debt the Canadian River Gas Company now is about 60 per cent retired; that is, the initial debt.

Q. Through that method of amortizing it over that period of years?

A. That is correct.

Q. In the computation of the direct cost of gas that is included as a part of that cost, isn't it?

A. That is right. In the exhibits preceding these showing the cost of gas at contract, the Clayton method is used and provides for the amortization of not only the bonds but the subsequent notes plus interest.

Q. Now, then, you provide for a period of years ending —what is that date? Is 1956 the date of the life of the field?

A. Yes, sir.

Q. At that time you contemplate that the operations of these properties, gas producing and gathering, as far as Exhibit No. 276 is concerned, will cease?

A. That is correct. On Page 3 of the written statement, Mr. Hendee in his Exhibit No. 255 has testified that from the standpoint of major gas pipe line companies, the economic life of the field will be reached; that is, in 1956, and the commercial production of gas will cease by the end of that year.

Q. Now, in setting up your requirements of revenues—well, first of all, in Exhibit 276, as well as in the related exhibits following, I don't see where you have given any consideration at all to the net salvage value that the two exhibits—rather, the exhibits presented by your company as Exhibit 281 called for.

A. No, there is no consideration of salvage given in any of these exhibits.

Q. I see in Exhibit No. 281, the exhibit put on by the company, shows a net salvage value as of January 1, 1956 of $198,384.69.

A. I haven't considered it.

Q. Why haven't you given it any consideration?

A. In the first place, I was dealing principally with the amount of property as of December 31, 1956, the end of that year. The property beginning on a rate basis is as of January 1, 1939. I did not consider the salvage, because in the first place I didn't have the salvage figure available; in the second place, for the purpose of this particular exhibit, I don't think the salvage plays an important part in it. It is only $198,000 and that $198,000 on the Canadian River Gas Company would not make any material difference in the cost of gas at Clayton.

Q. It would serve as a credit if you did utilize it, wouldn't it?

A. It would serve as a slight deduction, yes, sir. However, $198,000 against the total property base of approximately $14,000,000 is not a very large figure.

Q. Over that period of years there would be an additional charge of that total of $198,384.69?

A. That is right.

Q. That does not now appear or is not reflected in your exhibit?

A. No, sir, it doesn't appear in my exhibit.

Q. Returning to Exhibit 276, I notice in Mr. Roberts' exhibit he does not depreciate either land or rights of way in Exhibit 272 and the related exhibits.

A. I don't think he does.

Q. If I recall correctly, he specifically stated that he did not depreciate lands in fee or rights of way.

A. That is correct, Mr. Roberts hasn't shown any accumulated depreciation or depletion of lands or rights of way.

Q. Yet you have included both land as well as rights of way in your amortization plan. Lands, as I have it, includes an item of $3,656 and rights of way $60,659. Why have you included them in your amortization plan?

A. Well, the company expects to recoup under the principle set forth in Exhibit 276 all of the cost, which includes lands and rights of way.

Q. That is true, but there is no depreciation accruing on either one of those items?

A. Not under this plan, no, sir.

Q. And Mr. Roberts doesn't contemplate that either one of those items is depreciable property?

A. That is correct.

Q. But you still, under your method of computing this Exhibit 276, included them in your amortization plan?

A. That is correct.

Q. Well, then, as you see it, the company hasn't been able to get any of its investment on that back between 1928 and 1939 on either one of the two items?

A. That is correct. Mr. Roberts' exhibit and this exhibit begins with January 1, 1939.

Q. You proceed in that fashion, although the rate has heretofore been set on debt amortization in the contract?

A. That is correct.

Q. Let's turn to Statement 12, Exhibit 276. That pertains to the working capital requirement on all gas, doesn't it?

A. That is correct.

Q. First of all, how did you determine the amount of working capital required for future years 1940-1947?

A. That was based upon the estimated operating expenses for the year 1940 in relation to Exhibit No. 192, and the averages were moved every year. It is set forth on a five-year moving average basis.

Q. Then in addition to estimating the total, you got an estimate here by dividing the amount required between the production, gathering, and transmission of compressing systems?

A. That is correct.

Q. How did you arrive at that allocation?

A. That allocation was arrived at on the basis of Exhibit No. 192 which provides three component parts of working capital, material and supplies, one-eighth of the annual operating expenses, and a nominal amount for cash in local banks. The materials and supplies were segregated on a property basis; the annual operating expenses were segregated on an expense basis and the cash required, the nominal amount of cash required, was also segregated on an expense basis.

Q. Then you assumed an increase of your cash balance of about 50 per cent over a period of years, and through 1946, don't you?

A. Well, we assume here in 1940 a total working capital required as computed by the basis I explained of $205,000, and in 1947 it was $275,000.

Q. How do you assume a 50 per cent increase in your materials and supplies during that period of years? Is that in Line 1 of your computation on—what statement in your Exhibit 276 is comparable with Statement 10, Exhibit No. 277? I see your Statement 10 in Exhibit 276. Let's turn to that.

A. That isn't working capital, Mr. Lange.

Q. I know, but I want to refer to that statement.

A. All right.

Q. That sets forth the property investment as of January 1, 1939 and right on through 1948, doesn't it?

A. Yes, sir.

Q. Now, that shows an increase over that period of years of approximately 20 per cent, doesn't it?

A. The total property under Column 8, Statement 10, Exhibit 276, shows an increase of about $2,500,000 which is about 20 per cent.

Q. About 20 per cent?

A. Yes, sir.

Q. Why are you providing for an increase of approximately 50 per cent in your working capital for materials and supplies during that year when your property investment as shown herein increases only 20 per cent during that period?

A. Well, as far as the working capital statement is concerned, that is not based primarily on materials and supplies, but on the increased operating expenses to a great extent.

Q. That is, to some extent but not entirely?

A. Well, the weighting of the materials and supplies increase is based upon the property increase, and the increase in operating expense would take up the difference between 20 per cent and 50 per cent, or 25 per cent and 50 per cent.

Q. So that is a judgment figure that probably increases requirements in working capital?

A. It is a computed figure based upon previous exhibits.

Q. And the allocation of it is estimated?

A. It is based on—as I said before, part of it is based upon a property division and part of it on an expense division.

Q. Going back again to Statement 10, Exhibit 276, the property investment as of January 1, 1939, the items under production system, Column 3, are taken from a previous exhibit heretofore prepared by you?

A. Yes, sir, the additions as indicated by Note B, Statement 10, property additions in 1940 and thereafter, as shown in Statement No. 3, Exhibit 184, and Statement 3, Exhibit 133.

Q. Under the production system, that first item of $5,825,683 in 1939 includes the total of those leaseholds that have been set up on the books heretofore, including what had previously been under that Appreciation account?

A. That is correct, with the depletion as indicated in Mr. Roberts' Exhibits 272 and 273.

Q. Going down to Line 17, replacement reserves, autos and trucks, drilling and cleaning equipment, now, those items of property are what you would term short-life property?

A. Yes, sir.

Q. The depreciation there is on the straight line basis as distinguished from your sinking fund method applicable to the other method?

A. That is correct.

Q. Going back to Statement 2, Columns 8, 9 and 10, are those set up here in lieu of your debt amortization provision in your contract?

A. That is correct, replacement reserve, provisions for depreciation and depletion and an 8 per cent return in lieu of the present method of interest and the amortization of debt.

Q. Now, Column 11, Statement 2, that is where you set up the Federal taxes?

A. Yes, sir.

Q. How do you arrive at this almost 100 per cent increase in 1947 of $414,184 as against $207,159 in 1946?

A. In 1947 you will notice that over in Column 2, the column there, gas royalties have been reduced almost 50 per cent due to the elimination of the Chicago line gas, principally. As explained in the other operating statements, or the other statements and exhibits, the total operating expenses under Column 7 have been reduced from $710,777 to $493,830. The taxes have also been reduced under Column 6.

Now, any reduction in operating expenses and in operating taxes, all of which are allowable deductions and under the present statutory regulations for income tax purposes, naturally tend to increase income taxes.

Q. That, of course, assumes your revenues would be the same as you have heretofore projected?

A. That assumes that the company would still be entitled to enjoy an 8 per cent return on the value of its property.

Q. And this Column 6 where you have taxes set up and a reduction in 1947, you mean by that a reduction in severance taxes?

A. That is principally reduction in severance taxes.

Q. This exhibit basically is intended to present these figures as you computed them, disregarding in its entirety the provisions of the contract?

A. That is correct. This is an alternative method of the contract for rate making purposes.

Q. Let's turn to Statement 11, Exhibit 276, Mr. Lusk. Now, the first item in Column 2, $5,825,683, that is the depreciated original cost base as you have it in your production system for January 1, 1939?

A. That is correct; that comes from Statement 10.

Q. Well, what do you add to that after the year 1939?

A. Well, the property additions in 1940 and thereafter are taken from Exhibits 184 and 133. Those exhibits are the production and gathering system and the transmission system, including the Bivins compressing station from the intake side of Bivins going north.

Q. That's all that is added every year to the figures in Column 2?

A. Well, it is only the production system in Column 2.

Q. In so far as production system properties are concerned?

A. They do appear on one exhibit.

Q. And in subsequent years the items appearing in Column 2 don't reflect any deductions for depreciation during any of those years?

A. No, sir.

Q. You are just adding to them every year whatever additions have been made to the property?

A. That's correct.

Q. And do those additions also include replacements?

A. No, sir.

Q. They don't?

A. No, sir, only as shown in Exhibit 184, the amounts shown in Statement No. 10 and Statement No. 11 for the production and gathering system, taken from Exhibit 184.

Q. And they contemplate only whatever additions have been made to the properties over and above any replacements?

A. That is correct, yes, sir.

Q. And you proceed in the same fashion with Statement 11 of the exhibit with reference to the gathering system properties and also with reference to the transmission and compressing properties?

A. That is correct. The additions to the gathering system are taken from Exhibit 184 and additions to the transmission and compressing system are taken from Exhibit 133.

Q. And in each instance, of course, the items; that is, under Column 6 for gathering and Column 10 for transmission and compressing properties, represents the depreciated base as of January 1, 1939?

A. That is correct, as taken from Mr. Roberts' Exhibits 272 and 273.

Q. And for subsequent years in each of those columns the dollar additions represent property additions?

A. And estimated property additions at a gross figure, yes, sir.

Q. And then the only other element in computing the rate base in each instance for the three systems is the average working capital that you have projected under Columns 3, 7 and 11?

A. That is correct.

The Trial Examiner: We will stand in recess for five minutes.

(At this point a short recess was taken, after which proceedings were resumed as follows:)

The Trial Examiner: The hearing will be in order.

By Mr. Lange:

Q. Mr. Lusk, turn to Exhibit 276, Statement No. 6, required revenues from all gas. I notice in Column 10 there you have the amount required for the 8 per cent return for each year.

A. Yes, sir.

Q. Now, in the computation of your required taxes, that is set up on Statement 13, isn't it?

A. Which tax?

Q. Capital stock tax and income tax.

A. That is set up on Statement 13, yes, sir.

Q. Now, in Column 10 of Statement 6, I see you have for 1940 the amount required for an 8 per cent return, being $909,027.

A. That's correct.

Q. Now, how do you determine the amount attributable to the Denver line as distinguished from the amount for those taxes attributable to the Chicago line and other sales?

A. Well, in Exhibit 276 the amount of gas delivered to Chicago has been excluded in its entirety. The allocations for property and all of the operating expenses begin with Statement 2 for production system, and an 8 per cent return shown under Column 13, Statement 2. The percentages arrived at are taken from Statement No. 9 in Exhibit 164 which excludes all of the Chicago gas from both production and gathering.

In the transmission system the Chicago system doesn't enter into any of Canadian River Gas Company's transmission system.

Q. But in computing your percentages in each of your—well, Statements 2, 3 and 4, the columns 13, 10 and 14, respectively, as to the amount of return required, wouldn't that when applicable to the total required show that the income tax returns applicable to the Denver line are much higher than what they should be?

A. Well, the income tax applicable to the Denver line is a computed figure based on the 8 per cent return of $643,088 as shown in Column 14, Statement 2, and also in Column 11 of Statement 3 and Column 5 of Statement 4.

The additions, or any amount that is applicable to the Chicago line, is excluded from all of these computations.

Q. What about the amounts applicable to Amarillo?

A. They are included in the totals. That is, the Amarillo Oil Company and the deliveries along the line—

Q. Yes.

A. They are excluded in the percentage for the Amarillo Oil Company gathering and Transmission under the B contract is excluded, because they are well mouth delivery.

Q. Now, going back to that Statement 6 of the exhibit in Column 10 for the year 1940, doesn't that $909,027, that's the total amount that you say is required for the obtaining of the 8 per cent return?

A. That's correct. That comes from Statement No. 11.

Q. Well, now, that's applicable to all three systems, isn't it?

A. That's correct, production, gathering and transmission.

Q. That necessarily applies to all details, doesn't it?

A. This is all gas delivered at Clayton, yes, sir.

Q. Now, does this $909,027 on Statement 6 refer to the total amount required with reference to all properties of the company?

A. All properties of the company devoted to delivery of gas at Clayton Junction, New Mexico for the Colorado Interstate Gas Company.

Q. Yes. Now, I notice also in the computation of your Federal income and capital stock taxes, Statement 13, Column 4, on the basis of what law are you computing those taxes for the years 1940 through 1947?

A. In Column 4?

Q. Yes.

A. The excess profits—that is on the basis of the 1940 excess profits law.

Q. You don't take into consideration the subsequent amendment to the act which would have the effect of reducing that excess profit?

A. Providing the last two years were higher than the first two years of the four.

Q. Providing the last two years were higher than the first two?

A. That is correct.

Q. That is your interpretation of the applicable provision only?

A. The amendments of the 1940 excess profits law which became effective about the middle of March of this year allows companies subject to excess profits tax to compute their excess profits tax allowable base either by the average four-year method or the last two years, whicheyer produces the largest amount of allowable in order to effect the smaller amount of tax.

Q. And in the light of your interpretation, then, you say that that doesn't in any manner *effect* your computations in Column 4, Statement 13?

A. It might affect them slightly but I don't believe that the difference in the tax would amount to a great deal.

Q. It would have the effect of reducing them?

A. Reducing them slightly, yes, sir.

Q. Now, you stated previously in your testimony this morning with reference to the method that had been pursued by the company in amortizing its debt under the contract that that method was put into force and effect at the time of the commencement of operation in 1928, wasn't it —the amortization plan?

A. The amortization of the debt of the Canadian River Gas Company did not begin until about 1930, as I remember, under the terms of the indenture.

Q. Under the terms of the indenture?

A. That's right.

Q. And you also stated the approximate amount that had been retired on that debt under that plan, up through 1938, didn't you?

A. Oh, when I mentioned the 60 per cent I was thinking of the present date.

Q. The present date?

A. Yes.

Q. That is as of now?

A. Yes.

Q. Rather, or say as of December 1, 1940? Or what particular time did you have in mind?

A. I think I have a 1939 statement here which I can read right off.

Q. Yes.

A. "The amount of first mortgage debt outstanding as of December 31, 1939 was $5,057,000.

Mr. Dougherty: That is Canadian River?

The Witness: Canadian River Gas Company, and the initial debt of the Canadian River Gas Company of first mortgage bonds was $11,000,000. It's about 55 per cent retired as of December 31, 1939.

By Mr. Lange:

Q. And that was over a period of how many years?

A. As I recall, the first amortization of debt began in 1929 or 1930.

Q. Now, you stated this morning in connection with the question I asked you as to what would be the situation in the event this proceeding—this present proceeding hadn't taken place now but might probably have taken place in 1954 or thereabouts, that if such were the case the company within a short period of a year or two years would have to suffer that loss in difference in value or difference in the amount of dollars that they hadn't recouped.

A. That's correct, theoretically they would suffer a loss.

Q. That would be theoretical because if the hearing was not had they would very likely continue to proceed in the fashion that they have heretofore proceeded up to now.

A. That is correct. It is a difference of opinion between a regulatory rate making basis and what actually occurred from an accounting standpoint as actually stated on the books.

Q. So when you made a statement as to the company sustaining a loss, that is theoretically?

A. That's right, as set forth in Exhibit 276 for rate making purposes.

Q. Because under the provisions of that contract there are sections that take care of the matter of the company being fully reimbursed for its expenditures and investments made during the period?

A. That is correct. Under the contract the Canadian River Gas Company's debt will be extinguished as of June 1, 1948.

Q. Now, on Page 4 of your Exhibit 276 you state that you set up your sinking fund basis on the strength of certain figures that appeared in Mr. Knapp's exhibit.

A. That is correct. That is to arrive at an interest rate of two or three-quarters per cent which was used in the computation of accruals to the sinking fund in this exhibit.

Q. And as you have previously stated, the company has of course not in fact set up any sinking fund method on its books at all.

A. No, the company does not set up a sinking fund on its books. It makes payments to a sinking fund for the extinguishment of its debt.

Q. Yes, but it doesn't proceed in the fashion as defined in the term, or as contemplated under the term "sinking fund method of depreciation"?

A. No, it doesn't follow that at all.

Q. Of course, any additions after 1939, plant additions to the company's property would be financed by these accumulations rather than by any funds set aside under this sinking fund method?

A. No. In this exhibit it is not contemplated to upset the sinking fund once it has been started. It continues as a sinking fund without using the fund itself for any additions to capital required.

Q. Well, just as a matter of practical application, do you think any company would set aside that amount of money every year at that rate of interest as you theoretically calculate under this sinking fund method?

A. Well, any company that is setting aside an amortization reserve under the sinking fund method at the present rate of 2-3/4 per cent, I think would be perfectly justified in keeping their fund intact without disturbing it in that way of making withdrawals from it for property additions.

Q. They would be perfectly justified in doing it but in your opinion as a practical matter, do you think the Canadian River Gas Company would ever contemplate doing that in practice?

A. If the Canadian River Gas Company were forced into it, I think they would.

Q. Well, you say if they were forced into it, but that appears very improbable that they would proceed in setting up a method contemplating the recovery of only that small amount of interest, doesn't it?

A. Well, as far as the recovery of a small amount of interest is concerned, of 2-3/4 per cent, I think that the Canadian River Gas Company and the Colorado Interstate Gas Company also in order to protect themselves against loss and risk, they would be forced to invest in securities, either the triple A as defined by Moody or United States Treasury bonds, the average yield of which is 2-3/4 per cent.

Q. But as you say, they haven't in fact done that, and so far as you know it is not contemplated that they are going to do it.

A. I don't think they will, no, sir.

Q. Do you really think as an accountant that the Canadian River Gas Company would put money in such a fund when they could be earning 8 per cent interest on the rate base?

A. Well, as far as the Canadian River Gas Company is concerned for the purposes of this proceeding and the Colorado Interstate Gas Company, neither property is an expanding or a growing property, so they can't reinvest the sinking fund in their own securities—or in their own properties, I should have said, not securities.

Q. Well, there is a growth over that period of years as shown in Statement 10 of your exhibit.

A. That is quite right. These are just as explained in previous exhibits for well drilling and for the additional lines or the new wells. As far as expanding the property itself is concerned, no.

Q. Well, of course, that is a relative term, but there is an increase in the company's investment of some 20 per cent over that period of ten years.

A. That's correct. It increases about two million, five hundred thousand dollars in ten years. That's $250,000 a year average.

Q. And if they could earn 8 per cent on that money or any portion of it, it certainly wouldn't comport with good operating management to not get that return if it could.

A. Well, that—under the principle established in this exhibit we have contemplated keeping the fund itself intact at the 2-3/4 per cent rate.

Mr. Lange: I believe that is all on this exhibit.

Mr. Dougherty: Mr. Lusk, I think on Statement 10 there is a blank space at the bottom where there is a reference to other exhibits to be put in. That is Statement 10, Exhibit 276.

The Witness: That's "Accumulated Depreciation and Depletion" shown in Exhibits Nos. 272 and 273.

Mr. Lange: That's Statement 10, Mr. Lusk?

The Witness: Yes.

Mr. Dougherty: Then I think the same thing would be true on Statement 10 of Exhibit 277, would it not?

The Witness: The accumulated depreciation and depletion shown in Exhibits Nos. 274 and 275.

Mr. Dougherty: I have no redirect on those.

By Mr. Lange:

Q. Turn to your Exhibit 277, Mr. Lusk.

A. Yes, sir.

Q. That exhibit consists, or confines itself to the treatment of assumed resale gas and assumed resale gas operations alone as distinguished from all gas.

A. That's correct, yes, sir.

Q. Now, turning to the Statement No. 2 of the exhibit, Column 3, I note that your rentals on unoperated leases, you have that entire amount attributable to resale as well as you have to all sales, haven't you?

A. That's correct, yes, sir.

Q. And under gas expense you have practically all of that attributable to resale, haven't you?

A. That's correct. All of the—in Columns 2, 3, 4, 5 and 13, all of those amounts are taken from Exhibit No. 167.

Mr. Dougherty: What statement are you reading from?

The Witness: Statement 2, Exhibit 277.

Mr. Dougherty: Well, Mr. Lusk, all of those items shown in Items 2, 3 and 4, and subsequently, are totals.

The Witness: For resale gas alone.

Mr. Dougherty: But you applied your percentage in Column 2 to all of those totals?

The Witness: I mentioned that 2, 3, 4, 5, and 13, in Exhibit 267.

By Mr. Lange:

Q. And then how do you arrive at that percentage that you apply in Column 13?

A. That is shown on Statement 9 of Exhibit 167.

Q. Will you proceed in the same fashion with reference to the treatment of the items and the percentage on Statement 3 of the exhibit?

A. Yes, sir. That is the same total gathering operation for resale gas alone, including 8 per cent return on depreciated original cost base, Column 10, and the per cent as shown on Statement 9, Exhibit No. 167.

Q. Now, Statement 4 of the exhibit, do you have under "Gasoline Expense" how much of that is assigned to resale gas only for the year 1939?

A. This is all of the gasoline operation and the resale gas alone percentage under the transmission costs as shown under Column 14 which is also taken from Exhibit 167, Statement 9.

Q. Now, under Column 7 of that same Statement 4, your revenue gasoline plant attributable to resale gas alone, how do you arrive at that per cent?

A. That is the total gasoline plant revenue taken from Statement 8 attached and only applies to the Bivins gasoline plant. The gasoline plant revenues shown on Statement 8 are taken from Exhibit 167, Statement 4.

Q. And your replacement reserve, Column 9, Statement 4?

A. That is shown on Column 10 attached.

Q. In that instance, again it is the same as on all gas?

A. Yes, sir, all of these statements, 2, 3, and 4, are total operation, and the percentages in Column 14 are applied

Q. I notice in your treatment of lands in fee and rights of way—referring to Statement 10, do I understand you proceeded in the same fashion in this exhibit as you did in Exhibit 276? You included both lands in fee as well as rights of way in your amortization plan?

A. That is correct.

Q. Although Mr. Roberts did not in computing his items of depreciable property include either one of those as items of depreciable property?

A. That is correct, Mr. Roberts in his Exhibits 274 and 275 does not depreciate or set up any accumulated depreciation for either lands or rights of way.

Q. Of course, in the property investment item on Statement 10, Column 3, your production system property, there has been no allocation made as to leasehold property between all gas and resale gas?

A. No, sir. In Exhibits 134 and 193 there has been no allocation of the value of the leaseholds on the premise of Mr. Watson's Exhibit No. 121 in which he states that he would need all of the leases even if the company only enjoyed resale gas alone.

Q. But if you had a resale system of gas alone and not the all sale gas system operating, it is very probable that there would be a different volume of withdrawals as well as rates of withdrawal of gas in the field?

A. That is possible.

Q. If there were different volumes of withdrawals as well as a different rate of withdrawal, that would have a definite effect upon the life of the field, the producing life of the field? As you would draw more gas from the well it would be apt to shorten its life, and if you withdrew less gas you would be apt to lengthen the life of the well?

A. Well, in the particular case of Canadian River Gas Company, if we took the direct sale of gas as we determined it and reduced the total withdrawals, the difference in the depleted condition would be about one-half of one per cent as of January 1, 1939.

Q. As projected by you as to the contemplated requirements for those future years?

A. That is correct.

Q. But a difference in the actual withdrawals as well as in actual rate of withdrawals would have a very definite bearing upon the life of the field?

A. Well, it might. I don't know, as I would have to work that out as to just what the withdrawals were and the rates of the withdrawals.

Q. I am not viewing it from a geologist's standpoint, because you are not intending to get into that province.

A. No, sir.

Q. It is purely from an accounting standpoint, what an accountant would have to take into consideration?

A. That is possible, yes.

Q. And as I understand it, Mr. Lusk, in the preparation of this exhibit you have followed the same method in which you computed the items in Exhibit No. 276?

A. That is correct, the same principle applies.

Q. Excepting Exhibit 276 in so far as 1939 is concerned, represents figures reflecting actual operations as computed by you?

A. That is correct

Q. But not any of the figures as set forth in Exhibit No. 277 do or could in fact reflect actual operations?

A. They are estimates applicable to resale gas alone.

(Vol. C, pp. 15387-15427.)

---

33. **Colorado Interstate's Estimated Net Operating Earnings, After Income and Capital Stock Taxes and Payment for Gas at Regulated Price at Clayton Junction, of Colorado Interstate from the Denver Line, Determined on a Regulatory Basis and Under the Assumption that the Supply of and Markets for Gas Continue Beyond 1948, the End of the Project Term, and Until the End of 1956, Applicable to Depreciation, Amortization and a Return on the Original Cost, Less Accumulated Depreciation, and Amortization of Such Property, Including Contracts Plus Working Capital.**

The company's Exhibit 285 by the witness Lusk (Vol. XCVII, p. 15010) brings together the data, most of which has already been abstracted, to present the facts stated in the caption.

The past and estimated future revenues from all gas sales have been abstracted under Title 15 supra and are the same as those shown in Exhibits 170 and 172.

The computed cost of gas on a regulatory basis is taken from Exhibit 276, which has been abstracted under Title 31 supra. All other operating expenses and taxes, less rentals received, are taken from Exhibit 135, which, together with other related exhibits, have been abstracted under Title 23 supra.

The expenses on account of income and capital stock and like taxes are computed in Statement 5, Exhibit 285, where he used the same methods abstracted under Title 29 supra. His computation of these taxes is further abstracted hereinafter.

Depreciation and amortization expenses are based: (a) for physical property on the original cost less the observed depreciation abstracted under Title 27 supra, and (b) for gas purchase and sales contracts on the unamortized book cost remaining on January 1, 1939, and are computed on a sinking fund basis. This subject is further abstracted hereinafter.

The rate base which he uses, and denominates "depreciated original cost rate base," is made up of the original cost of the properties as shown in Exhibit 67, which, together with other related exhibits, is abstracted under Title 18 supra. From this original cost he subtracts the accumulated depreciation to December 31, 1938, as shown in Exhibit 283 abstracted under Title 27 supra; he then adds the annual property additions required to the end of 1947, shown by Exhibit 133 also abstracted under Title 18 supra; he then adds the cost of the gas contracts, set forth in Exhibit 77 and abstracted under Title 19 supra, properly depleted or amortized. The gas purchase contract with Canadian is depleted with the exhaustion of the recoverable gas reserves and the book cost of the sales contracts is amortized over their respective lives. Finally he adds in working capital, as abstracted under Title 22 supra. These items all set forth in Statement No. 4 of Exhibit 285 result in his total rate base at January 1 of each of the years 1939 to 1947 as follows:

1939	$12,938,453	1944	$13,324,011
1940	12,973,949	1945	13,326,011
1941	13,092,685	1946	13,327,011
1942	13,100,685	1947	13,328,011
1943	13,323,011		

He then uses an 8% return, as set forth in Exhibits 73, 74, 92 and 93, all abstracted under Title 28 supra. After giving effect to all the foregoing data and factors, he arrived at the following earning statement: (Statement 1, Exhibit 285).

Colorado Interstate Gas Company
Revenues on a Regulatory Rate Basis (A)
The Denver Pipe Line Sales of All Gas
Summary by parts, and Comparison with Actual, 1939 to 1947 Inclusive

Calendar Year	Revenues All Gas Sales (B)	Required Operating Revenues				Revenues Addition to Revenues Required for 8% Return
		Operating Costs and All Taxes (C)	Depreciation and Amortization (D)	Required for 8% Return (E)	Total	
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1939	$ 4,309,232	$ 2,250,543	$ 600,372	$ 1,035,076	$ 3,885,991	$ 423,241
1940	4,479,168	2,576,162	600,372	1,037,916	4,214,450	264,718
1941	4,813,523	2,765,581	600,372	1,047,415	4,413,368	400,155
1942	4,958,068	2,842,051	600,372	1,048,055	4,490,478	467,590
1943	5,033,833	2,938,919	600,372	1,065,841	4,605,132	428,701
1944	5,171,059	3,035,798	600,372	1,065,921	4,702,091	468,968
1945	5,328,240	3,160,654	600,372	1,066,081	4,827,107	501,133
1946	5,328,240	3,282,289	600,372	1,066,161	4,948,822	379,418
1947	5,328,240	3,765,377	600,372	1,066,241	5,431,990	—103,750
Totals for Period	$44,749,603	$26,617,374	$ 5,403,348	$ 9,498,707	$41,519,429	$ 3,230,174

Notes: (A) Including an 8 per cent return on a depreciated original cost rate base as shown on Statement No. 4, and provision for depreciation and amortization by a sinking fund method with compound interest at a rate of 2¾ per cent per annum.

(B) From Exhibit No. 170. Statement No. 3, Column (5).

(C) From Statement No. 2 attached.

(D) From Statement No. 3 attached.

(E) From Statement No. 4 attached.

This earning statement follows the same general pattern of the earning or rate statements abstracted supra. The facts and evidence especially applicable to it are now dealt with.

As to depreciation and amortization, Lusk included the following statement: (Exhibit 285, p. 2; Vol. XCVII, p. 15011 et seq.)

"Depreciation and amortization are estimated by the sinking fund method as shown in Statement No. 3 attached, whereby the amounts invested in the property would be recovered by equal annual payments and accumulated compound interest at a rate of 2¾ per cent over the respective useful lives of the several items listed below:

(a) Those items whose lives extend through 1956:

1. The original cost of the depreciable gas property at December 31, 1938 (Exhibit No. 67) less the accumulated depreciation therein (Exhibit No. 283), plus the annual additions in 1939 up through 1947 at cost (Exhibit No. 133).

2. The recorded book amount and cost of the gas purchase contract with Canadian River Gas Company (Exhibit No. 77) depleted with the exhaustion of the recoverable gas reserves.

(b) Those items whose lives extend through June, 1948:

1. The recorded book amount and cost of the gas sales contracts with the Public Service Company of Colorado and Pueblo Gas and Fuel Company (Exhibit No. 77) less the accumulated amortization at December 31, 1938, pro rata with their expired lives.

2. The recorded book amount and cost of the gas sales contract with the City of Colorado Springs (Exhibit No. 77) less the accumulated amortization at December 31, 1938 pro rata with its expired life.

"Another witness (Mr. R. W. Hendee, Exhibit No. 255) has testified in respect to the gas supply of Colorado Interstate Gas Company that from the standpoint of the major gas pipe line companies the economic life of the Panhandle Field will be reached and the com-

mercial production of gas will cease by the end of 1956. Colorado Interstate's property and the cost of its gas purchase contract therefore should be fully amortized by that time.

"As noted in Exhibit No. 276 for the cost of all gas delivered at Clayton, 2¾ per cent is the average of the interest rates on AAA Utility Bonds and U. S. Treasury Bonds from 1937 to 1940, basic data for which was taken from Exhibit No. 225 by Mr. Knapp.

"An allowance has also been included herein for the annual accumulation of funds needed for the replacement of short lived property such as trucks and automobiles. Such provision has not been made in the sinking fund requirements for depreciation and amortization."

Statement 3, Exhibit 285, summarized his treatment of depreciation and amortization as follows:

Colorado Interstate Gas Company

Annual Provision for Depreciation, Amortization and Replacements on a Regulatory Rate Basis

The Denver Pipe Line Sales of All Gas

Depreciated Original Cost at January 1, 1939 Plus Additions at Cost to January 1, 1948

Classification of Property	Total Amount to Be Recovered (A)	Annual Requirements for Depreciation Amortization and Replacements	
		Per Cent of Total	Amount
(2)	(3)	(4)	(5)
Physical Property Subject to Depreciation	$11,606,730	4.368% (B)	$506,990
Property Subject to Amortization:			
Gas Purchase Contract	1,229,880	4.368 (B)	53,718
Gas Sales Contracts:			
Public Service Co. of Colorado and Pueblo Gas & Fuel Co.	167,649	9.809 (C)	16,445
City of Colorado Springs	131,949	9.809 (C)	12,943
Total	$ 1,529,398		$ 83,106
Property Subject to Short Term Replacement:			
Automobiles and Trucks	36,883		10,276 (D)
Total	$13,173,011		$600,372

Notes: (A) As shown in total on Statement 4 attached.

(B) Based on life expiration in 1956.

(C) Based on life expiration in June, 1948.

(D) Annual accumulation based on average annual provision from 1934 to 1938.

On being cross-examined as to this Exhibit 285, as well as Exhibit 286 dealt with in the next title, and related exhibits of Canadian 276 and 277, he stated that the company itself had not set up depreciation or amortization as he had done in this exhibit but that such sinking fund provisions had been set up only in case regulation became effective and as an alternative plan which the company could then elect to follow (Vol. C, p. 15391).

The physical properties to be depreciated by sinking fund method were those in existence at December 31, 1938, plus the estimated additions (p. 15433), less, in the case of physical properties in existence, the observed depreciation existing at December 31, 1938, shown in Roberts Exhibit 283 (p. 15437). The period over which such properties are to be depreciated is an eighteen-year term; that is, the period January 1, 1939, to the end of 1956, on the assumption that the gas supply would last through that year (pp. 15436-37-38). The property to be depreciated as set forth in this exhibit, as well as the property in Exhibit 286 and the related exhibits 276 and 277 of Canadian, is the depreciated original cost as of December 31, 1938 (p. 15388); that is, its observed depreciated condition at that time (p. 15389), plus necessary additions to the property (p. 15396-97).

The cost of the gas purchase contract with Canadian is included in the property to be amortized without deduction or apportionment because of the Chicago Line. The Chicago Line came in long after that contract was made (p. 15434). The remaining cost of this contract ($1,229,800) is amortized over an eighteen-year period to the end of 1956. This is on the assumption that the gas supply will last to that time and this contract is amortized over that period because, while it terminates on June 1, 1948, it has a renewal clause (p. 15429). But as to sales contracts with Public Service, Pueblo Gas and Fuel and the City of Colorado Springs, they must be amortized by June 1, 1948, when they expire. (Evidence as to the expiration of franchises from Denver to Public Service and from Pueblo to Pueblo Gas and Fuel and the requirements of the charter that there must be public elections to renew such franchises to such distributing companies has been abstracted under Titles 1, 3, 5 and 8 supra.). The gas sales contracts

with Public Service and Pueblo Gas and Fuel are being amortized over a twenty-year period ending June 1, 1948 (p. 15431) and the contract with Colorado Springs over a seventeen-year period beginning in 1931, with the inception of the contract and ending June 1, 1948. The remaining costs of these sales contracts must be amortized because the company paid for them as a condition of getting such business (pp. 15429-32).

In setting up the depreciation and amortization reserves on the sinking fund method, he assumed that the money set aside for that purpose would be kept intact and invested and not used to purchase additional plant (Vol. C, p. 15419), and he assumed that such money would draw interest, which would be compounded, at the rate of 2¾% over the respective useful lives of the items of property covered by the fund. He took the figure of 2¾% as being the return on non-speculative investments, arrived at by the Commission's witness Knapp in his Exhibit 225, Charts 3 and 4.

In setting up the depreciation reserve he did not give effect to salvage either in this exhibit or in Exhibit 286 or in Canadian's related Exhibits 276 and 277. Evidence of the amount of salvage was not available at the time he prepared this Exhibit 285 (p. 15402). Later, the company witnesses Taubman, Smith and Solow testified that for all of Colorado Interstate's property, the salvage would be only $131,019.95. (This evidence is abstracted under Title 27 supra.) And in the case of Canadian the salvage would be only $198,000 (Vol. C, p. 15402).

The Commission's engineer Lee M. Hill testified that at the end of the service lives assigned by him to the several items of property, the salvage would be "negligible" (Title 27 supra). Salvage would therefore not affect importantly the net results over the period extending through 1956 (p. 15402).

The Federal and state income taxes and the Federal excess profits and capital stock taxes were calculated on the assumption that present tax rates would continue in effect and the computations were made in the same manner as in the case of Exhibits 170 and 172, as amended, abstracted under Titles 29 and 30 supra.

Revenues from the sales to the Chicago Line are not reflected in these tax expenses applicable to the Denver Line and the Denver Line is not "carrying the entire tax for all operations." (pp. 15451-53).

Summing up this operating statement, Lusk said: (Exhibit 285, p. 4)

> "It will be noted on Statement No. 1 that the revenues received, both actual and estimated as shown by Column (2) which include both resale and direct sale gas, are greater than the total required operating revenues as shown by Column (6). The additional earnings shown by Column (7), amounting to $3,230,174 in the nine year period shown are entirely attributable to sales of direct sale gas."

The balance in this amount depends on the following assumptions:

> First, that the present prices or rates for gas will continue and that the revenues of the company will hold up as shown in Exhibits 56 and 43 as abstracted under Title 15 supra.
>
> Second, that the cost of gas as shown by Exhibit 276 as abstracted under Title 31 supra, will remain the same.
>
> Third, that other operating expenses and operating taxes as shown by Exhibits 76, 135 and 135-A, as abstracted under Title 23 supra, will not increase over the estimates therein made.
>
> Fourth, that the Federal and State income taxes and capital stock taxes based on present laws (1940) and as abstracted and computed herein, will not be increased (Vol. XLVIII, p. 6620).
>
> Fifth, that the company can remain in business and be able to use its property beyond 1948 and until the end of 1956, and that, accordingly, annual depreciation and amortization expense will not have to be increased so as to retire or recover said property or the investment therein by 1948 instead of 1956.

Through its accountant, Kenneth L. Smith, in his exhibit 185 (Vol. LIV, page 7495, et seq.) the Commission offered a consolidation of figures for both Colorado Interstate and Canadian, after giving effect to the disallowances, adjustments and reclassifications made by its accountants with respect to the expenses, rate base, recomputed reserve for depreciation, and a reduced rate of return for each of said companies. After giving effect to all of these reductions and disallowances and adjustments by these accountants of the Commission, he shows an average return on the net investment, as computed by him for the period of 1928 to December 31, 1939, of 15.14%.

Respecting this exhibit he testified on cross-examination: He realized that the two companies were separate entities and each has contracts, which have been filed (Vol. LXXXVII, p. 13182) but that he did not follow contract terms (p. 13187). He did not take the net revenues actually received but operating revenue deductions were built up by Mr. McKinstry, another Commission accountant and him (p. 13187). He took income and surplus accounts bodily from the exhibits of the Commission accountants (p. 13188).

Although not subject to Commission jurisdiction, he included figures with respect to sales to Amarillo Oil Company.

"Q. So the consolidated operating revenue figure in Column 7 is not the gross income of Colorado Interstate Gas Company from the sale of gas from its pipe line and sale to Chicago, but represents some money that it does not receive?

"A. That is correct. Of course, I think that following that situation through that it has been dealt with in Mr. Lyon's Exhibit." (p. 13190).

The depreciation figures are based on the service lives furnished by the Commission's engineer, Mr. Hill, and on the life of Canadian's acreage in the field testified to by the Commission's witness Mr. Hammer (p. 13198).

"Q. Now, on Sheet 24 you have deducted each year the accrued depreciation. Is there anything in the Federal Power Commission Code of Accounts to provide for doing that?

"A. I think indirectly there is, yes.

. . . . . .

"Q. But the Code actually doesn't provide for making that subtraction in showing your balance sheet as you have done here on Page 24?

"A. It doesn't spell it out but it doesn't prohibit it." (pp. 13200-01).

The results as set forth in his exhibit are not what the "past history" or the "books" of the company show but what would be the case after all Commission deductions and disallowances and reaccounting for depreciation are given effect (pp. 13205-06).

---

34. Estimated Net Operating Earnings, After Income and Capital Stock Taxes and Payment for Gas at Regulated Price at Clayton Junction, of Colorado Interstate for an Assumed Denver Line for Resale Gas Only, Determined on a Regulatory Basis and Under the Assumption That the Supply of and Markets for Gas Continue Beyond 1948, the End of the Project Term, and Until the End of 1956, Applicable to Depreciation, Amortization and a Return on the Equivalent Original Cost, Less Accumulated Depreciation and Amortization of Such Property, Including Contracts, Plus Working Capital.

The company's Exhibit 286 by the witness Lusk (Vol. XCVII, p. 15016) brings together the evidence showing the facts stated in the caption. The methods employed are similar to those shown in Exhibit 285, last above abstracted. This exhibit is also analogous to some extent to Exhibit 172, as amended, abstracted under Title 30 supra.

The revenues from resale gas are as shown in Exhibits 43 and 56 abstracted under Title 15 supra and are the same as set forth in Exhibit 172, above abstracted under Title 30.

The cost of gas at Clayton Junction determined on a regulatory basis is taken from Exhibit 277 and this subject is abstracted under Title 32 supra.

The operating expenses and operating taxes applicable to a Denver Line for resale gas only (excluding income and

capital stock and like taxes) are as shown in Exhibit 136, less rentals received, as shown in Exhibit 172. Such operating expenses and taxes are abstracted under Title 24 supra.

Expenses on account of depreciation and amortization are estimated on a sinking fund basis and in the same general manner as set forth in Exhibit 285 abstracted next above. As the property to be depreciated, he took the equivalent original cost of the depreciable property as shown in Exhibit 134, plus the annual additions required 1939 to 1947 at cost as shown in Exhibit 134, abstracted under Title 20 supra, and he gave effect to the accumulated depreciation as of December 31, 1938, as shown in Exhibit 284, abstracted under Title 27 supra.

He included for working capital the amounts estimated in accordance with Exhibit 70, abstracted under Title 22 supra.

He computed state and Federal income and Federal capital stock and excess profits taxes applicable to resale gas alone in Statement 5 attached to this Exhibit 286 in the same manner as for all gas covered by Exhibit 285 and abstracted in the preceding title.

He used as a rate base the equivalent original cost at January 1 of each of the years shown as set forth in Exhibit 134, plus the annual additions required, 1939 to 1947, at cost, all abstracted under Title 20 supra. From this he subtracted the observed accumulated depreciation at December 31, 1938, as shown in Exhibit 284 abstracted under Title 27 supra. To this he added the cost of gas contracts depleted or amortized in the same manner as set forth in the preceding Title 33. He then added average working capital as abstracted in Title 22 supra. Altogether these items resulted in the "depreciated equivalent original cost rate base" set forth in Statement 4 to Exhibit 286, as follows:

1939	$11,675,536	1944	$12,616,146
1940	12,372,146	1945	12,617,146
1941	12,376,146	1946	12,618,146
1942	12,383,146	1947	12,619,146
1943	12,615,146		

He used an 8% return as set forth in Exhibits 73, 74, 92 and 93, abstracted under Title 28 supra, pointing out that such return was testified to by all witnesses regardless of whether the sales were of direct sale or resale gas.

Giving effect to all of this evidence and these factors, his Statement 1 attached to Exhibit 286 shows the following results:

Required Operating Revenues on a Regulatory Rate Basis (A) From "A Denver Pipe Line for Resale Gas Alone"

Summary by Parts and Comparison with Actual, 1939 to 1947 Inclusive.

Calendar Year	Operating Costs and All Taxes (B)	Required Operating Revenues: Depreciation and Amortization (C)	Required Operating Revenues: Amount Required for 8% Return (D)	Required Operating Revenues: Total Required Operating Revenues	Total Revenues Actual and Estimated (E)	Deficiency of Actual Revenues to Meet an 8% Return
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1939	$ 1,762,920	$ 569,583	$ 934,044	$ 3,266,547	$ 2,938,383	$ 328,164
1940	2,169,744	569,583	989,772	3,729,099	3,202,643	526,456
1941	2,228,845	569,583	990,092	3,788,520	3,424,257	364,263
1942	2,220,232	569,583	990,652	3,780,467	3,566,052	214,415
1943	2,322,598	569,583	1,009,212	3,901,393	3,693,267	208,126
1944	2,360,429	569,583	1,009,292	3,939,304	3,827,743	111,561
1945	2,415,931	569,583	1,009,372	3,994,886	3,982,174	12,712
1946	2,599,649	569,583	1,009,452	4,178,684	3,982,174	196,510
1947	3,563,976	569,583	1,009,532	5,143,091	3,982,174	1,160,917
Totals for Period	$21,644,324	$5,126,247	$8,951,420	$35,721,991	$32,598,867	$3,123,124

Notes: (A) Including an 8 per cent return on a depreciated equivalent original cost rate base as shown on Statement No. 4 and provision for depreciation and amortization by a sinking fund method with compound interest at a rate of 2¾ per cent per annum.

(B) From Statement No. 2 attached.

(C) From Statement No. 3 attached.

(D) From Statement No. 4 attached.

(E) From Exhibit No. 172 Statement No. 3 Column 4.

In conclusion Lusk stated on page 4 of Exhibit 286:

> "It will be noted on Statement No. 1 that the total domestic and industrial resale gas revenues received both actual and estimated as shown by Column (6) are less than the required operating revenues as shown by Column (5) and are therefore insufficient to meet an 8 per cent return on the depreciated equivalent cost rate base. The amount of deficiency in revenue from resale gas shown by Column (7) amounts to $3,123,124 in the nine year period shown."

The deficit or deficiency in that amount is arrived at on the following assumptions:

> First, that the present prices or rates for gas will continue and that the revenues of the company will hold up as shown in Exhibits 56 and 43 as abstracted under Title 15 supra.
>
> Second, that the cost of gas as shown by Exhibit 277 as abstracted under Title 32 supra, will remain the same.
>
> Third, that other operating expenses and operating taxes as shown by Exhibit 136, as abstracted under Title 24 supra, will not increase over the estimates therein made.
>
> Fourth, that the Federal and state income taxes and capital stock taxes based on present laws (1940) and as abstracted and computed herein, will not be increased (Vol. XLVIII, p. 6620).
>
> Fifth, that the company can remain in business and be able to use its property beyond 1948 and until the end of 1956, and that, accordingly, annual depreciation and amortization expense will not have to be increased so as to retire or recover said property or the investment therein by 1948 instead of 1956.

The witness was cross-examined about his Exhibit 286 in conjunction with Exhibit 285 and his statements as to the method of computing income taxes and requirements for depreciation and amortization made with respect to Exhibit 285 are in general applicable to his Exhibit 286 (Vol. C, p. 15438-43).

Further Testimony of the Company's Witness, Lusk.

Q. Mr. Lusk, you have also prepared Exhibits 285 and 287 relating to the operations of the Colorado Interstate Gas Company?

A. Yes, sir.

Q. Turn to Statement 3, Exhibit 285. I note that on Statement 3 you have an addition to your Item No. 1, physical property, also subsequent items. First of all, is item 2, gas purchase contract, which you included in your base. Is that correct?

A. Yes, sir.

Q. What gas purchase contract is that in Item 2?

A. That is the gas purchase contract between the Canadian River Gas Company and the Colorado Interstate Gas Company, dated January 3, 1928.

Q. You have included that in your regulatory rate base and applied what you assumed would be the annual requirement for the depreciation and amortization of that item?

A. Yes, sir.

Q. Well, is that the way the company has heretofore treated that purchase contract?

A. No, sir, the amount of the gas purchase contract as treated heretofore by the company—that was treated by writing it off over a 20-year period.

Q. Over a 20-year period?

A. Yes, sir.

Q. Beginning when?

A. June 1, 1928.

Q. June 1, 1928?

A. Yes, sir, and to terminate on June 1, 1948.

Q. I notice you have the Letter "B" affixed to this gas purchase contract "Based upon Life Expiring in 1956," is that correct?

A. That is correct.

Q. In that respect you are also departing from the method that the company is computing its amortization of that contract?

A. Yes, under the principle and premise that that contract will expire in 1948, but there is a renewal clause in that contract.

Q. After 1948?

A. After 1948.

Q. Well, then, the way you treat the item here, you contemplate that the Colorado Interstate Gas Company will avail itself of that option?

A. That is the premise here.

Q. And it will renew the contract?

A. Yes, sir.

Q. Now, the total amount of dollars in Column 3 for that item, $1,229,800, is that a departure, too, from the company's treatment of the item?

A. That is right.

Q. What does the company set that up on?

A. On a 20-year life basis with approximately five per cent a year. For the purpose of Exhibit 285, gas purchase contract has been depleted in accordance with the gas withdrawn from the Panhandle field.

Q. According to the company's books, to what extent has it been depleting? What I meant was this: What was the amount of amortization up through 1938, 1939, or 1940?

A. I don't have the New York statement with me, but I believe it is around 55 per cent amortized.

Q. Approximately $950,000 net as of this time?

A. That is correct. If it is 5 per cent amortized, the amortization would be $1,100,000 and the remainder $900,000.

Q. As of January 1, 1939, that is the date you set up in Statement 3, isn't it?

A. Yes, sir.

Q. You have also included in your regulatory rate basis in Statement 3, two other gas sales contracts, Items 3 and 4, haven't you?

A. The first one was a gas purchase contract.

Q. Yes. There are two gas sales contracts?

A. Yes.

Q. And you have treated those in connection with this exhibit as having a life expectancy until June 1948?

A. That is correct. On the sales contracts of the Public Service Company of Colorado and the Pueblo Gas & Fuel Company it is a 20-year life, and on Colorado Springs it is approximately 17 years. Both contracts expire as of June 1, 1948.

Q. Well, how has the company treated its items on its books heretofore?

A. They have been amortizing those on a straight life basis.

Q. Over what period of time?

A. Twenty years for the Public Service Company of Colorado and the Pueblo Gas and Fuel contract, and approximately 17 years for the city of Colorado Springs.

Q. Beginning as of what year in each instance?

A. The contracts with the Public Service Company of Colorado and the Pueblo Gas and Fuel Company began in 1928 and the City of Colorado Springs contract began in 1931 with the subsequent amendment and adjustment as of March 1932. All of that is shown in Exhibit No. 77.

Q. Now, then, if in June 1948—strike that.

Do either of those contracts have any renewal provisions in them?

A. Not that I know of.

Q. Then if in June 1948 substitute contracts would get into the picture there, you would have to upset your amortization plan, wouldn't you?

A. No.

Q. What would you do from that period on to 1956?

A. Well, if those contracts were renewed they would be new contracts.

Q. And you would begin a new amortization of them over that period to 1956?

A. If it cost the company anything, yes.

Q. What do you mean, cost the company anything? Supposing there is some stock issued for them?

A. The company would probably follow the same procedure.

Q. The company would probably follow the same procedure as they had heretofore?

A. Yes.

Q. Now, your automobiles and trucks, those are treated as short-life property on the straight line depreciation basis?

A. Yes, sir.

Q. So when you take this Statement 3 and view it in the light of what you say the annual requirements in so far as depreciation and amortization matters are concerned, you have a pretty diverse setup here, haven't you, on several bases?

A. No, there are only two bases as shown in Statement 3. The physical property subject to depletion and amorti-

zation and the gas purchase contract are the same and the application would be the same in both cases.

The two gas sale contracts are taken on a straight life basis.

Q. Of course, in addition to that, you begin with your physical property against which you have applied per cent condition as of December 31, 1938, disregarding any previous amortization of debt or depreciation that had been set aside and had accumulated?

A. That is correct.

Q. And Statement 3, Item 1, Physical Property, as I understand it, also includes land in fee as well as rights of way that are included in your amortization requirements?

A. That is correct, all of the property shown as of December 31, 1938, plus the estimated additions have been amortized as of 1956.

Q. In the same fashion you did in connection with Canadian River Gas Company's property in Exhibit 276?

A. Yes, sir, the same principle applies.

Q. Returning again to this Item 2, Statement 3, that—strike that.

Statement 3 is applicable to the Denver line sales of all gas?

A. Yes, sir.

Q. It is?

A. Yes, sir.

Q. Now, then, going down to Item 2, gas purchase contract, have you made any allocation of the $1,229,800 or the item that the company has on its books for that amount to the Chicago or other sales points of the gas?

A. No, sir.

Q. Why not?

A. Because the Chicago line gas came in long after this contract was made.

Q. Well, the purchases are made under that contract, aren't they?

A. That is correct.

Q. It is applicable to the Chicago line?

A. That is correct.

Q. Well, if the purchases of gas are actually being made under that very same contract, don't you think that good

accounting practice would require that a proportionate part of that alleged contract cost be allocated to the Chicago sales?

A. Well, I think there may be another exhibit showing an apportionment of all these items.

Q. That isn't in here?

A. No, sir.

Q. So you haven't apportioned them in this exhibit?

A. No, sir, there hasn't been any apportionment of the Chicago line gas, as far as the gas purchase contract is concerned, in this exhibit.

Q. Now, you haven't, or have you, prepared an exhibit showing what the revenues from direct sales of gas would be?

A. No, sir.

Q. You haven't?

A. No, sir.

Q. So when you make this statement on Page 4 of your written statement that certain additional earnings shown in Column 7, Statement 1, amounting to $3,230,174 in the 9-year period shown are entirely attributable to sales of direct sale gas, you are arriving at that amount purely on the basis of deduction, not directly?

A. That is correct, arrived at by deduction.

Q. By the process of deduction?

A. Yes, sir.

Q. Of course you haven't set up what a system devoting itself entirely to direct sale gas would produce?

A. No, sir. There have been no computations made of a hypothetical system for direct sale gas alone.

Q. So in arriving at this 3 million dollar item on Page 4, that is the result of deductions made by you?

A. Yes, sir.

Q. Now, on Statement 2 of your Exhibit 285, Mr. Lusk, Column 2, computed cost of all gas at Clayton, where is that taken from?

A. That comes from Exhibit 276, the one we just finished.

Q. Do you have Exhibit 276 there before you?

A. Yes.

Q. In Statement 1 of Exhibit 276—oh, yes, that Column 5 of Statement 1 of Exhibit 276?

A. Yes, sir, that is carried over to Column 2, Statement 2, Exhibit 285.

Q. Now, your Statement 1, Exhibit 285, Column 4, the depreciation and amortization requirements that you say will have to be set up for that period through 1947, are equal annual instalments computed where? On statement 3?

A. Computed from Statement 3—computed on Statement 3, yes, sir.

Q. And for physical property, the rate is 4.368 per cent?

A. Yes, sir.

Q. And if, of course, the properties to which this rate is made applicable on Statement No. 3 had been amortized over the entire life of those properties, you would have a rate of probably one-half of that, wouldn't you?

A. Well, I think instead of having an 18-year period, I would have the 28-year period.

Q. 28-year period, and those portions of the—or, rather, that percentage of the property that has heretofore been—that percentage of the investment that has heretofore been recouped is entirely disregarded in setting up this 4.368 per centage at this time, isn't that true?

A. That's correct. For the purposes of this exhibit as in the Canadian River Exhibits 276 and 277, we begin as of a date certain, January 1, 1939, for both companies.

Q. And now the loss in property value during the life of the property, what consideration have you given that in setting up this computation?

A. Well, in setting up this computation here, as is also the case with Canadian River Gas Company, beginning with a date certain, and merely adding the gross amount of additions. The depreciation as of January 1, 1939 is set forth in Mr. Roberts' exhibits.

Q. Well, now, do you know what the Uniform System of Accounts' definition gives for amortization, Definition No. 4, amortization? It says: "Amortization means the gradual extinguishment of an amount in an account by prorating such amount over a fixed period over the life of an asset or liability to which it applies, or over the period of which it is anticipated the benefit will be realized."

Do you agree with that definition?

A. The amount on Statement 1 of Column 4 includes compound interest calculation.

Q. That is true, but this says over the life of the asset

or the period during which it is anticipated the benefit will be realized.

A. Well, the life in this case for, the purpose of this exhibit is assumed to be in 1956 based on the economic life of the field.

Q. Yes, but at the end—that is, at the end period, but what about the beginning period? This certainly doesn't contemplate in the use of the term "life of the asset" that you begin long after middle age and then just compute up to the end?

A. Well, that's quite right, but the Federal Code of Accounts now doesn't make—or the Federal Power Commission itself doesn't make any provision retroactive and the Code itself under the Federal Power Act became effective in 1938 and we are beginning as of January 1, 1939.

Q. Well, this became effective January 1, 1940, the Uniform System of Accounts.

A. There was a two-year allowance or a two-year period of grace for the natural gas companies to put their houses in order and attempt to follow the Federal Code of Accounts.

Q. Is this the putting of the house in order, then, in setting up this method of accruing your depreciation and amortization?

A. Well, that's our present principle here.

Q. Well, what is your opinion with reference to the definition in the Uniform System of Accounts from an accounting standpoint?

A. Well, I think as far as Exhibits 285 and 286 and 276 and 277 are concerned, why, the depreciation and amortization columns—that's what we are talking about—Definition No. 4 is the same thing. The gradual extinguishment of an amount by prorating over a fixed period. That's exactly what we are doing.

Q. Yes, but it doesn't stop there. It says the life of the asset or the period during which it is anticipated the benefit will be realized.

A. Well, the position taken in all of these statements is that the life begins as of January 1, 1939.

Q. Well, then, you don't consider that the company had gotten any benefit that accrued prior to that time at all?

A. Yes, it did receive and enjoy benefits prior to that time, but again I state that—

Q. To a very considerable extent, too, didn't they?

A. Yes, sir.

Q. All of which was paid out of the proceeds of the sales of gas the company made.

A. That's correct.

Q. Oh, I don't believe I asked you whether your agreed with the definition that the Uniform System of Accounts gives us to depreciation, Definition 14.

A. Yes, I think that is a fair definition.

Q. A fair definition? What do you mean by a fair definition, Mr. Lusk, now treating it purely from an accounting standpoint? Isn't that a very practical method to set up there or contemplated under that definition?

A. It is a practical method but I think that the phrase "means a loss in service value" should be elaborated upon.

Q. You think it should be elaborated upon?

A. Yes.

Q. There is one phrase that doesn't need any elaboration at all and that is—"depreciation means loss in service value"—you may have some elaboration there, but this part doesn't need any elaboration, does it—"not restored by current maintenance?" You are in accord with that, aren't you?

A. Yes, sir.

Q. Well, now, when you proceed to Definition 35, you find service value defined, don't you? Isn't that sufficiently elaborated on there to give you the meaning?

A. No, I think there should be a little more elaboration on the use of the term "service value."

Q. It says it means: "The difference between the original cost and the net salvage value of the gas plant."

You have an exhibit which you say is the net salvage value and all we have got to do is to determine what the original cost is, and of course you say you don't agree with Definition 29 of original cost of such property first devoted to a public service.

A. I think I have *dispose* of salvage *an* original cost.

Q. Doesn't that fully spell out any possible implication that may be in the picture there, either by inference or otherwise?

A. No, for this reason: Loss in service value can be construed in several ways. For instance—and Mr. Lee Hill

in his service value life has used the life of the field. The pipe lines themselves may be in 95 per cent physical condition when the field goes out. Now, what is the loss in depletion of a gas field?

Q. Well, if you compute your depreciation as the straight line method contemplates and take into consideration the service lives in computing that and also observe this portion of the definition on depreciation in the computation of your service lives, I think you won't get into that difficulty. Under Definition 14 of depreciation: "Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand and requirements of public authorities; and in the case of natural gas companies the exhaustion of natural resources."

That is taking the factors into consideration that you were complaining about.

A. Well, service value here means over in Instruction 35, it means original cost, and net salvage value. Now, when did the net salvage value take place, at the time the natural gas field is exhautsed? And then again the exhaustion of property of natural gas companies due to the exhaustion of natural resources, how can that be restored, by current maintenance?

Q. Well, if you set up your books on the straight line method and proceed in the fashion as contemplated under this Definition 14, I don't see—rather, I want to know from an accounting standpoint why you don't think that that would be practical.

A. I do. I think it is practical if those definitions are elaborated upon.

Q. Now, then—oh, yes, I forgot to ask you in connection with your use of the term "original cost," Statement 3 of Exhibit 285. I mean in so far as the words "original cost" there are concerned, you again disregarded the original cost as contemplated by the definition in the Uniform System of accounts.

A. Oh, no.

Q. As to cost to predecessor companies.

A. Not in the case of the Colorado Interstate Gas Company. There wasn't any predecessor in the Colorado Interstate.

Q. That's right. That was only applicable to the Canadian River Gas Company?

A. That's right.

Q. Well, then, going back to your Exhibit 276, I think that was Canadian River.

A. And 277.

Q. 276 and 277, where you there use the words "Depreciated original cost." The word "original" did not contemplate the original cost to predecessor companies?

A. That's quite right. It is the cost to the Canadian River Gas Company in Exhibits 276 and 277.

Q. That's right, but in your Statement 3 of Exhibit 285, Item 1, "Physical Property," the 11 million dollar item does include your reaccounting?

A. Yes.

(Vol. C, 15428-15443.)

* * * * *

Cross Examination (Continued).

By Mr. Lange:

Q. Do you have Exhibit No. 286 before you, Mr. Lusk?

A. Have you finished with Exhibit 285?

Q. For the time being. You might keep it there in front of you, though.

A. All right.

Q. This exhibit confines itself to assumed revenues applicable to a resale gas plant alone of Colorado Interstate Gas Company.

A. Yes, sir.

Q. I notice that on Page 4 of the written statement, Exhibit 285, you say: "The additional earnings shown by Column 7, amounting to * * *" that is Statement 1, isn't it?

A. Statement 1, Column 7.

Q. "* * * amounting to $3,230.174 in the 9-year period * * *"

A. Yes, sir.

Q. That, of course, is computed on an assumed basis of the plant devoting itself to resale gas alone and entirely disregarding all direct line sales, including Colorado Fuel & Iron sales?

A. Yes, sir, the exhibit itself is built up of operating

costs and taxes from another statement, another exhibit, and depreciation and amortization and the amount required for an 8 per cent return calculated on the property base of a 20-inch line from resale gas alone.

Q. Which is not in fact existent?

A. No, sir.

Q. Now, then, you say that your 8 per cent return that you utilized is predicated upon testimony that has been presented in this proceeding by Mr. Coffman, Mr. Gilman, Mr. Sands, and Mr. Bosworth, in several exhibits named on Page 3 of your written statement.

A. That is correct. All of those gentlemen have testified to an 8 per cent return.

Q. All of those gentlemen also testified with reference to a plant that sold all gas?

A. I believe that is correct, yes, sir.

Q. I don't believe any one of them contemplated predicating or fixing a rate of return for a company that did not sell all gas?

A. Their testimony was confined to the Colorado Interstate Gas Company on an 8 per cent return overall.

Q. That is right, overall.

A. I believe that is right.

Q. It wasn't in any fashion limited to a resale gas operation?

A. I don't think so, no, sir.

Q. If that is the case, the fact that you used their testimony in this respect is of course reading into it a limitation as to what kind of company they had in mind, isn't it? In other words, you are limiting it to the kind of company, a resale company, whereas they had no such limitation in mind in their testimony or exhibits?

A. I don't know what they had in mind. The 8 per cent return used in this exhibit—it is implied the 8 per cent would apply to all gas and resale gas alone. There is no distinction as far as these exhibits are concerned.

Q. In other words, you make it applicable to the all gas exhibit as well as to the resale gas exhibit without distinction?

A. That is correct.

A. And in both instances you predicated it upon the testimony and exhibits of those named witnesses?

A. Yes, sir.

Q. And in each instance, of course, not any of those witnesses in his testimony or in his exhibit made any such distinction between all gas and resale gas alone?

A. I am not sure but I don't believe they did.

Q. Note Statement 3, Exhibit 286. Under your property items that are included in your regulatory rate base, the gas purchased contract as well as the gas sales contract, being Items 2, 3, and 4, have not been allocated between resale gas and all gas, have they?

A. No, sir.

Q. Exhibit 285, Statement 3, shows the all gas items, and items 2, 3 and 4 are the same in both exhibits?

A. The same in both exhibits for all columns 3, 4 and 5.

Q. And the general property; that is, the property subject to short term replacement, such as automobiles and trucks, is the same?

A. That is the same, yes, sir.

Q. And in the construction of this exhibit you followed the same methods that you did in the construction of the previous exhibits that you identified; that is, of the series beginning with 276?

A. Yes, sir, the same applies to Exhibits Nos. 276, 277, 286, and 287.

Q. You mean—

A. I mean 285 and 286, not 286 and 287.

Q. And the principles applied by you on the two resale gas exhibits; that is, Exhibits 277 and 287, are predicated on the same basis as the previous resale exhibits you identified in this proceeding?

A. That is correct, yes, sir.

Q. Now, there is a matter I wanted to ask you about that is applicable to all of these exhibits. Please get your Exhibit 276, Mr. Lusk.

A. All right.

Q. Refer to Statement 6 of the exhibit. I didn't quite get it clear this morning—

A. You mean Statement 6?

Q. Statement 6, Exhibit 276, required revenues from all gas on a regulatory rate base. I didn't quite get clear this morning as to your method of computing income taxes. I just wanted to inquire at this time with reference to the

amount set up for 1940. Column 10 shows the amount required on an 8 per cent return for the year 1940 of $909,027.

A. That is right.

Q. That is the starting point of your computation of the Federal income tax figures you have on Statement 13 of the exhibit?

A. Yes, that is the ground work for the Federal income tax computation on Statement 13.

Q. All right, now let's go to Statement 2 of the exhibit. That covers the production operations, doesn't it?

A. That is production, yes, sir.

Q. Under Column 10 you have the amount required for an 8 per cent return for 1940 of $510,866.

A. That is for all of the production operations of the Canadian River.

Q. That is 45.69 per cent of the total in Column 13?

A. No, Column 13 is the percentage applied to Column 12. That is in order to arrive at the amount of production cost on an 8 per cent return for all of the gas delivered at Clayton.

Q. Now, Statement 3, Column 7, for the year 1940 shows a total of $104,409, doesn't it?

A. Yes, sir.

Q. And the percentage applicable is 52.47, Column 10?

A. That is right, 52.47 of the gathering cost and 8 per cent return all gas delivered at Clayton Junction.

Q. Now, Statement 4, referring to transmission operations, Column 11, gives the figure of $293,752 for the year 1940.

A. Yes, sir.

Q. And the percentage applicable is 97.76 per cent?

A. That is correct for transmission cost and 8 per cent return all gas delivered at Clayton Junction.

Q. All right. Now, the total of the items which we have covered in Statements 2, 3 and 4, make up that total of $909,027?

A. Yes, sir.

Q. And it was on the total of $909,027 that you computed your Federal income tax on Statement 13 for the year 1940?

A. Yes, that was the basis.

Q. That is your normal tax of $123,660 for 1940?

A. That is right.

Q. Well, now, if you apply the percentages applicable as we have just read them to each of the producing, gathering and transmission figures and add the resulting totals, you have a total that is almost 40 per cent less, don't you, upon which you would compute your income tax figures?

A. In order to compute the estimated amount of taxes to be paid and assessed, there were certain deductions made from the $909,027 base.

Q. What deductions had to be made from that base?

A. For the year 1940 the base was $909,027. In addition to that $909,027 for tax purposes under the Internal Revenue Bureau's ruling we added back depreciation adjustments in accordance with the Internal Revenue's ruling in the amount of $44,009. The interest earned on the sinking fund under this method was $15,693 plus the income taxes of previous years which are non-allowable deductions. That made the gross $1,043,968.

As deductions, the depletion adjustment was $108,326, and the bond premiums $12,486, and the interest paid on the present indebtedness Canadian River Gas Company bonds was $407,905, making the total deductions $528,771, coming down to a net taxable income of $515,251.

Q. That is a net taxable income for all operations?

A. That is correct with the exception of the Chicago line gas.

Q. Does that exclude your Chicago line gas?

A. I was just thinking whether I said exclude or include. That includes the Chicago line gas.

Q. Includes it?

A. Yes, sir.

Q. Of course that figure is the one you used to start with to tabulate your 8 per cent return?

A. It is all profit, yes, sir.

Q. And that is how you arrived at the $123,660?

A. Yes, sir.

Q. It was calculated applying the percentage of tax?

A. That is correct.

Q. It is on Statement 13?

A. That is right.

Q. It is in Column 3?

A. That is right.

Q. Well, then, the Denver line is carrying the entire tax for all operations?

A. No. On Statement 2, Column 11, after the required amount for an 8 per cent return the computed Federal tax, Column 12 was the total production system of operations and we take 45.69 per cent of that.

Q. Well, now, if you took those percentages against each producing, gathering, and transmission system, that would give you the following figures: $233,415, which would be 45.69 per cent of the production figure?

A. I don't understand you.

Q. Take the production figure on Statement 2.

A. We will take 45.69, Column 11.

Q. Yes. What does that give you?

A. $21,556.

Q. And you applied the applicable percentage to the gathering as well as to the transmission system property as you indicated?

A. Yes, sir. That would be 52.47 of $22,497, Statement 3, or roughly, $13,000.

Q. On Statement 4?

A. It would be 97.66 per cent of $65,652, or roughly, $63,000.

Q. Now take your Statement 13, Exhibit 276. In Column 4, your excess profits tax, did you make similar percentage allocations there?

A. Yes, this $137,318, the total Federal taxes, is carried over to the earlier statement, being carried over to Statements 2, 3 and 4.

Q. Well, then, it would necessarily follow that you would assume that the excess profits tax applicable each year would arise on the same basis as allocation of cost of your normal income tax?

A. The excess profits tax is computed on the total amount of taxes under a normal rate. The excess profits tax itself is computed on the average net income for the past four years, 1936, 1937, 1938, 1939, and the excess over and above that is the basis for the excess profits tax.

Q. But the way it is allocated, necessarily shows it is predicated or based definitely on cost alone?

A. That is right.

Q. And it is not based in any manner on the relationship of selling price to cost?

A. That is right.

Q. You proceeded with the treatment of income tax computation and the allocation of it in the same manner in your other exhibit?

A. In Exhibit 277, yes, sir.

Q. Exhibit 277?

A. Yes, and in the Colorado Interstate exhibits 285 and 286 the same principle is followed.

Q. Of course in connection with Exhibit 286, the resale gas exhibit, the Colorado Interstate Gas Company does not presently confine its operations to resale gas alone and has not in the past confined its operation?

A. That is correct.

Mr. Lange: I believe that is all on that.

Redirect Examination.

By Mr. Dougherty:

Q. Mr. Lusk, in preparing Exhibits 276, 277, 285 and 286, were they prepared for the purpose of furnishing the basis for any rewriting of the company's books?

A. No, sir.

Q. As I understand, they were prepared for the purpose of showing what revenue should be collected by each company in order to give an 8 per cent return on the property base shown plus the various operating expenses and the provision for depreciation, depletion, and amortization.

A. That is the only purpose of these exhibits.

(Vol. C, 15444-15454.)

* * * * *

Q. In Exhibit No. 285, Statement 1, Column 7, revenues in addition to revenues required for 8 per cent return, are reflected in your income tax computation?

A. Did you say Exhibit 285, Mr. Lange?

Q. Yes, sir, Column 7, Statement 1, revenues in addition to revenues required for 8 per cent return.

A. That is right.

Q. Those are revenues in excess of 8 per cent return?

A. Yes.

Q. And, of course, those are also reflected in the computation of your Federal income tax requirements as set forth in Statement 5 of the exhibit?

A. Yes, sir, that is right.

Q. Both normal as well as excess profits tax?

A. Yes.

Q. It necessarily tends to increase the normal as well as the excess profits?

A. It depends upon whether the amount is computed on an 8 per cent return or whether it is revenues from all gas in Column 2, Statement 1, as taken from Exhibit 170.

Q. It would definitely increase the normal tax in Column 3?

A. That is right.

Q. And very probably would increase the Column 4 figure?

A. No, not Column 4. The depreciation and amortization is computed on a property basis.

Q. I mean Statement 5.

A. Statement 5?

Q. Column 3 is the normal column and Column 4 is the excess profits tax?

A. What's that?

Q. Column 3 is the normal column and Column 4 is the excess profits tax?

A. That is right.

Q. In fact, the large part, if not the greater part of this excess profits tax under Column 4 for each of the years could very well be due to that excess in revenues over 8 per cent that you have in Column 7, Statement 1?

A. That is right.

(Vol. C, 15455-15457.)

Further Testimony of the Commission's WITNESS, KENNETH L. SMITH.

CANADIAN RIVER GAS COMPANY AND COLORADO INTERSTATE GAS COMPANY
CONSOLIDATED BALANCE SHEET, AS ADJUSTED
